where B and C are both supposed to lie in a plane parallel to that of yz. It is plain that the twisted surface must pass through these points. This surface will be generally represented by the equation $\varphi(x, y, z) = o$; and it is the particular form of this equation that remains to be determined from the conditions of the problem. To do this in the simplest manner, let us consider a section of the surface taken at the heel and parallel to the plane of xy. For this the general equation of the surface becomes $\varphi(x, y, z') = o$, where z is now constant, and from which we obtain the equation of the section $y = \varphi x$. We have now to determine the form of the function φ such that when x becomes equal to a given magnitude, the resistance upon $s\delta z$ may be the least possible; the resistance acting upon the whole length of s. The resistance upon an elementary portion of the line s, is analytically represented by $\frac{dy}{ds}\delta y = \frac{dy}{\sqrt{dx^2 + dy^2}}\delta y$; and hence the whole resistance upon the elementary section $s\delta z$ will be $\delta z \int_{x=a_1}^{x=a_2} \frac{dy^2}{\sqrt{dx^2 + dy^2}}$; which must be a minimum by the nature of the question. As δz does not affect the quantity under the sign of integration, and may be regarded as constant in this part of the inquiry, we shall suppose the quantity divided by it when $\int_{x=a_1}^{x=a_2} \frac{dy^2}{\sqrt{dx^2 + dy^2}}$ = minimum, will simply represent a line which will be the locus of the equation of the generatrix of the twisted surface. By the known method of Maxima and Minima, we have $m^2 \frac{dx^2}{y^2} = \left(\frac{dx^2}{dy^2} + 1\right)^3$; the complete solution of which gives $\frac{dx}{dy} = \varphi : m = n$; and consequently $x = ny + r$, the equation of a straight line.

We are thus led to the conclusion, that the generatrix of the twisted surface is a straight line, moving parallel to the plane of xy, along the head of the plough, and the line joining B and C as its directrices. And this is true, independently of any particular form of head, or of the character of the line joining B and C. This result is important, as it conducts to the form of mould board that lays over the furrow slice with the least resistance. It is now manifest, that this principle must be adopted in all attempts to improve the construction of the plough. The wedge of the plough may now be said to be given in species; and experiment must determine the length of the wedge, and the definite form of head, which answer best in any particular soil. The absolute force of traction is given by the dynamometer. This is the measure of the total resistance. Now this total resistance naturally divides itself into the three portions of which it is composed, namely, the mechanical resistance on the wedge, the friction arising from the pressure of the furrow slice against the sides, and the friction on the sole of the plough dependent on its absolute weight. We might now attempt to combine these separate forces in a proper formula. But enough has been said for the present.—*X. Y. Z.*

Victoria Wheat, see p. 394, "*N. B*," *col.* b.—On Tuesday the 17th of July last, I was favoured from you with 19 grains of Victoria Wheat, which I planted that same day; it came up quickly, and as quickly came into ear, but either from the unfavourableness of the season or from, to me, unknown causes, every ear

is, what in this part of the kingdom is called blind, that is, no grain in it; in fact, I cannot find one. And as I am on the subject of Wheat, will you excuse my giving you the result of an experiment which I have recently concluded? On the 16th of July, 1844, I planted four grains of Red Wheat in a pot; in August, I divided the plants into the number 19. In Sept. I again divided them, making 31, and in Nov. I made another and last division, and had 90 plants. All but one or two lived, and in Sept., 1845, they produced 1440 stalks or straws, the ears on many of which were blind (I believe owing to mildew); there were two pints of grain by measure wieghing 23½ oz., and by counting the number of grains in a small cup-full I reckoned there were 23,645 grains, the produce of the original four grains. I hardly know if any great practical use could be made of this wonderful power of production, but, at any rate, it might be the means of speedily multiplying any rare sort, or cottagers might thereby cover a considerable space of ground from a very small portion of seed, as children could attend to the transplanting, dividing, &c.—*George Morse, Catton Park.*

Societies.

FLAX IMPROVEMENT SOCIETY.

At the Fifth Anniversary of this Society, lately held, the report for the year was read, and we make the following extracts from it:—"Last year the statistics of Flax culture, in Ireland, showed an increase of 50 per cent. on the amount grown in the first year of the Society's existence. It is difficult to form a correct estimate of the deficiency of this year's crop; but, from information which has been derived from the best sources, it may be taken at about one-fourth less than last year, say about 28,000 tons. Although there has been thus a considerable deficit in the quantity, the value of the crop, being greatly enhanced by the scarcity of the produce, both here and on the Continent, is about equal to that of last year. At 45*l.* per ton, average, the crop of 1844 was estimated at 1,782,495*l.* Calculating the advanced price of all qualities of Flax at 12*l.* per ton, average, the value of the crop of 1845 would be 1,596,000*l.*, and, adding the value of the seed saved for all purposes, the entire amount realised in Ireland, for the Flax crop of the present year, may be estimated at 1,750,000*l.*, being about the same as last year.

"*Causes of the Deficient Crop, and Measures taken against their Recurrence.*—It was known at the period in which the importation of foreign Flax-seed for sowing takes place, that the Russian crop of seed was not only extremely deficient in quantity, but that a very small portion of it would be sufficiently good for sowing. The price of all kinds of sowing Flax-seed rose at once to a very high average; and urged by fears of the quality of the seed, and of there not being enough for the amount of land prepared, as well as the high price, which precluded many of the poorer farmers from purchasing it, large breadths of land, intended for Flax, were sown with grain. Some unprincipled individuals, in the hope of realising large profits, had recourse to fraud, by making up old, inferior, crushing seed, in packages, similar to those in which good seed is imported, and imposing it on the market as genuine Riga sowing Flax-seed, of the importation of 1844. Unfortunately a large quantity of this inferior seed passed into the hands of the farmers, before your committee, or the public, were aware of the existence or extent of the fraud. Having been soon informed of this nefarious system, they publicly offered a reward for such further information as would lead to the exposure of the parties engaged in it. They also took the opinion of counsel on the liability of dealers to be sued by farmers for the loss which they suffer from such fraud; and this opinion they had published widely and circulated. As the report of these fraudulent practices had then got abroad, a panic arose among the farmers, and, to a great extent, stopped the further sowing of Flax-seed. Those who had purchased inferior seed found that very little of it would vegetate, or, that it grew so short, that they were obliged to plough it up, and occupy the land with some other crop. Three farmers who had thus suffered, applied to your committee for advice, and were advised to put their case in the hands of an attorney, and to sue the parties from whom they had obtained the seed, for the estimated value of a good crop of Flax, grown on the same quantity of ground. They hoped that if these cases were pushed to a successful issue, they would serve as precedents, which would be of great value in determining the extent to which dealers were liable by law for the results of their dishonesty. Although these cases did not eventually come forward, your committee feel much gratification in stating, that in consequence of the steps taken under their directions, the defendants, rather than let the cases be made public, paid these farmers the full amount for which they claimed, and which was upwards of 16*l.* per acre to each individual, for the produce of a Riga barrel, with the estimated costs.

"*Saving of Flax-seed for Sowing.*—The saving of Flax-seed for feeding cattle or to be sold for the oil mills, has always been urged by the society, as enabling the farmer to realise a value of from 3*l.* to 4*l.* per acre, which was formerly, and even yet is, in many instances, thrown away. Under the instruction of the agriculturists, this practice has been yearly gaining ground; and a very large quantity of the Flax seed crop is now saved, for the purposes before-mentioned. It was not, however, until the present year, that your committee could speak with confidence of the value of home-saved seed for sowing. From the experience of the last three years, they can now fairly say, that excellent crops of Flax may be grown from seed which has been saved in this country by the Courtrai method, from the growth of foreign Flax-seed. As soon as the result of the present crop confirmed them in this opinion, they circulated extensively, full instructions, recommending every Flax farmer to save a portion of his crop in this way, and thus secure for the following year fresh and genuine seed; and by this means, ensure a good crop, and rest free from any fear of fraud. By this method it would be only necessary to import as much seed from the Continent as would produce the quantity required for the next year's sowing. One-sixth of the present importation would thus suffice, and a saving be effected to the country of from 150,000*l.* to 160,000*l.* annually, now expended in foreign Flax-seed, besides the very important advantages of being rendered almost independent of foreigners for the extent of our crop of Flax, and of being secured from any chance of the failure of that crop from the use of spurious or bad seed." The following is that part of the report which alludes to the suitability of Ireland as a Flax-growing country. "Her climate and soil have already been proved to be equal to any for nourishing its growth – her hard working, but indigent labouring population, would gladly hail the great amount of employment which its preparation affords; her capacities for inter-communication, which are now being worked out, would greatly facilitate the transport of the article to the seats of consumption—while her vast, but dormant, capabilities for manufacturing industry, would be slowly, but surely developed. It would not then be too much to expect, that a wonderful increase of the linen trade would result, and that the manufacture of linen might stand in the same relation to Ireland that the manufacture of cotton has done to England; with this important difference, that whereas, in the latter case, millions are expended in foreign countries for a raw material, which our climate does not permit us to grow, in the former these millions would be expended at home, for the produce of Irish soil, the labour of Irish hands, and wealth and industry spread happiness and comfort through the land."—*Abridged from Northern Whig.*

Farmers' Clubs.

SAFFRON WALDEN: *Drainage, &c.*—At the 13th annual meeting of this Society, Mr. Palmer said—As to pipe draining, he had himself tried it; two years ago he purchased one of the tile machines for 25*l.*, which he put up at a brick kiln, and told the tenant if he set to work with it it would be an advantage to him; he did set to work—he turned out good pipes, which sold well in the neighbourhood, and since then he changed it for a machine to make three at a time. He had tried them himself, and he found that they ran exceedingly well; he had laid down pipes of an inch and a half and an inch and three-quarters, in fields which were of a gravelly and porous nature, and they had made the land perfectly sound, and he had no doubt the produce of the fields was much increased by it. He thought it was well worth the while of those landlords who had brick earth on their estates to have a machine for making the tiles. His practice always had been to find the tiles for the tenant, if he would pay for the workmanship, and he had always found them ready to act up to that; he thought this was fair between the landlord and the tenant, and a good bargain for both parties.—Mr. Pym said, the maxim which he learned when he commenced farming was to keep his land clean, dry, and in good heart; therefore he had carried out draining to some extent, and this year he had been turning his attention to a matter of great importance to light land farms—he meant that of manuring with bones dissolved in sulphuric acid. It was a very simple thing; if they had a few old casks, and sunk them in the ground, and put the bones in them, and then added the sulphuric acid, in 24 hours they would be dissolved. He gave about 4 bushels of bones an acre, and 10*s.* worth of sulphuric acid, and with this he had Swede and particularly good white Turnips after Tares. By that means they were enabled to husband their farm-yard manure, and get a crop of winter Tares before a crop of Turnips. The expense with the bones and the sulphuric acid was 24*s.* an acre; he had a quantity of bones which he bought last year, to go on with it now; and intended to weigh the Turnips thus produced against the Turnips grown from farm-yard manure.—Mr. Bramston begged to say that, occupying land of much shallower staple than that of his friend Mr. Pym, he had himself tried the same experiment with very much the same result. In comparing the result with Turnips grown after Tares, for which guano had been used, there was perhaps a small benefit in favour of guano; but the result of manuring with dissolved bones he considered to promise great benefit to agriculture, especially as he had heard from Mr. Pym the practical advantages of the system. He could not help observing that amongst the various bubbles which were now floating upon the surface of the speculating world, there seemed to be some which promised the farmer considerable benefit. He had witnessed with pleasure the formation of a society consisting of men of great capital, of much wisdom, and some of them of consummate agricultural knowledge, whose attention has been drawn to the desirableness of preventing the refuse of our great towns from being thrown away, and applying it to agricultural puposes. He was happy also to observe among the supporters of the society the names of Baring, Samuel Loyd Jones, Wm. Miles, and Smith of Deanston; and when he saw combined great capital, agricultural knowledge, and carefulness, as a guarantee that the funds would be applied judiciously, he augured well for the destinies of agriculture in this respect.—Sir J. Hansler wished to allude to the last subject touched upon by Mr. Bramston. He was connected with all the commissions of sewers in London, and he believed that it had been correctly ascertained that from the metropolis alone the quantity of soil emptied into the Thames would, in 24 hours, fill an area of 36 acres, 6 feet deep, so that the daily supply would manure nearly 3000 acres of land an inch deep. Now, when they saw ships going out for guano, he thought it behoved them to look whether they were not, in their own country, wasting those substances calculated to produce greater good to the land than any of those at present in use, and for which they had to cross the seas. Even the town of Saffron Walden, though of comparatively small extent, might, with proper pipes, be made to contribute materially towards fertilising the land in the district.—*Essex Standard.*

Reviews.

On the Domesticated Animals of the British Islands. Comprehending the Natural and Economical History of Species and Varieties; the Description of the Properties of External Form; and Observations on the Principles and Practice of Breeding. By David Low, Esq, F.R.S.E., Professor of Agriculture in the University of Edinburgh, &c. Longman, Brown, Green, and Longmans.

PROFESSOR LOW has placed the agricultural world under fresh obligations, by adding another to the many valuable works with which he has already enriched its literature.

The present volume relates to a subject on which no one is better qualified to write. The classification and specification of British domestic animals has long engaged the attention of its author. To his exertions the University of Edinburgh owe the magnificent series of paintings illustrative of this subject with which its agricultural museum is adorned. The results, given in this work, of the researches necessary to the execution of these paintings exhibit to us the great number of distinct varieties of cattle and sheep which are cultivated in these islands. It is impossible to suppose that mere local peculiarities can be so influential as to render each of their breeds the most economical for the district in which it is located; and hence the importance of works, like the present, which shall enable the agriculturist to form a correct judgment as to which, among the many existing varieties, is best suited to the circumstances in which he is placed.

Professor Low has already written on this subject: three years ago he published, in two large quarto volumes, coloured lithographic prints from the paintings in his possession, of some of the more distinct breeds of the horse, ox, sheep, and hog, accompanied by descriptive notices. The present volume, excepting the occasional woodcuts which it contains, is unadorned by engravings; the several breeds and varieties that are noticed receive merely verbal descriptions, but these are very full and interesting. Prefixed to each of the six sections in this work, respectively on the horse, ox, goat, sheep, hog, and dog, are remarks on the natural history of the animals to which they refer. And to the whole an introduction has been added, of great interest, on the classification of the animal kingdom generally, and on the properties of external form, and on the principles and practice of breeding.

Our present notice of this volume must be confined to that part of it which treats of the ox, and we cannot do better than transfer to our columns a paragraph or two in which the author recapitulates the names and some of the distinctive features of the breeds which he has described.

"1. The Wild or White Forest Breed, derived from a race which formerly inhabited, in a state of liberty, the woods of the country. Remains of this remarkable race have been preserved for ages in the parks of opulent individuals, where the animals, herding and breeding exclusively one with another, retain the habits of their wild condition. In other cases, they have been reared in a state of domestication, when they assume the habits and essential characters of the common varieties.

"2. The Zetland Breed, of Scandinavian origin, inhabiting the remote islands of that name, and spreading over the Orkneys. These cattle are of diminutive size, but fatten readily, and are valued by the consumers. The females excel the cattle of the Highlands in the faculty of yielding milk.

"3. The Breeds of the Highlands of Scotland, spreading over the primary mountainous tracts of North Britain. These cattle are of small size, covered thickly with hair, hardy, and suited to a country of heaths and mountains. The finest, usually termed the West Highland Breed, are produced in the countries on the western coasts, and certain islands of the Hebrides, the smallest in the central Highlands, and the largest towards the eastern coasts, in the countries mixing with, or bordering on the plains. These hardy cattle are reared in vast numbers on the natural herbage of the mountainous country where they have been indigenous from time immemorial, and whence they are transferred at the suitable age, to be fattened in the lower country.

"4. The Welsh Breeds, somewhat exceeding in size the West Highland Breed, and, like it, suited to a country of hills and natural herbage. They have dark or orange-yellow skins, and are mostly of a black

colour. The finest are reared in the county of Pembroke, in the district of Castle-Martin.

"5. The Kerry Breed, naturalised in the mountains of Kerry, but spread over all parts of Ireland. The cattle of this breed are of small size, and of various colours, with tapering horns. They subsist on scanty food, and the females, yielding milk abundantly, are valued by the poorer inhabitants for the dairy.

"6. The Polled Angus Breed, allied, in its essential characters, to the cattle of the mountains, but increased in size by being naturalised in a country of richer herbage, where artificial food can be supplied. This breed has dark skins, and is destitute of horns. It has been greatly improved by the care of the breeders, and is reared over a considerable tract of country.

"7. The Polled Aberdeenshire Breed, of mixed origin, and reared in the lower parts of the county of Aberdeen.

"8. The Galloway Breed, inhabiting a tract of greywacké hills in the south-west of Scotland; the cattle of which are greatly valued for their hardiness, their adaptation to the purposes of the grazier, and the quality of their beef. They are carried in great numbers to the pastures of England, chiefly of Norfolk, whence they are transferred to the London and other markets. They have deep bodies, dark skins, and are destitute of horns.

"9. The Polled Suffolk Breed, cultivated, for an unknown period, in Suffolk and the adjoining districts. The individuals are of medium size, with defective forms; but the cows are admirable for the quantity of milk which they yield. The breed is losing ground continually, from the want of care of the breeders, and the effects of crossing.

"10. The Polled Irish Breed, of large size, and well suited to the dairy, but much scattered, and merging in the races with which it is crossed.

"11. The Falkland Breed of Fifeshire, apparently derived from Holland, inheriting the milching properties of the Dutch races, but now nearly extinct in the pure state.

"12. The Alderney Breed, reared in the Norman Islands of the Channel, of small size and ungainly form, with short crumpled horns, of delicate constitution, and requiring a temperate climate, but yielding a rich and finely-coloured milk. This breed is regularly imported into England, where it is kept for the luxury of the opulent, or partially employed in the regular dairies of the countries of the Chalk.

"13. The Ayrshire Breed, derived from the county of Ayr, but widely spread over the dairy districts of Scotland, and extending in considerable numbers to Ireland. This is the most numerous breed, cultivated exclusively for the dairy, in the British Islands. The individuals are of medium size, and of various colours, with short horns. They are capable of subsisting on ordinary pastures, and yield a large quantity of milk in proportion to their size and the food consumed.

"14. The Devon Breed, naturalised in the higher parts of Devonshire, on the Bristol Channel, but spreading through the lower country. These cattle have orange-yellow skins, fine tapering horns, and are of a deep red colour. They are of a light and graceful form, agile, and suited for active labour. They fatten with sufficient facility on good pastures, and in a temperate climate; but they are inferior in hardiness, and the power of subsisting on scanty herbage, to the mountain cattle of Scotland and Wales. They increase in bulk when naturalised in a lower country, so that the breed of South Devon differs in size and aspect from that of the higher lands. The females are small, and deficient in the power of yielding milk, though the milk which they afford is well-coloured and rich in cream.

"15. The Sussex Breed, a variety of the Devon, and inheriting its properties, but of larger size, and less delicate form. This breed is now undergoing great improvement, but is little sought for, for the purposes of grazing, beyond the district in which it is reared.

"16. The Glamorganshire Breed, proper to the county of that name, common to the high and low grounds, but only brought to perfection in the vale of Glamorgan. This breed possesses valuable qualities, and combines well the properties of milching and fattening; but the numbers of the improved variety are limited, and circumscribed in their diffusion by other breeds more generally cultivated.

"17. The Herefordshire Breed, greatly valued for its fattening properties, and extensively diffused, for the purposes of grazing, in the west of England. It has a remote affinity with the Devon breed, and the cows inherit the defect of the latter, in being small and imperfectly suited to the dairy.

"18. The Long-horned Breed, from time immemorial spread over Ireland and the western counties of England, still occupying a great tract of country, both in the mountains and plains, and varying in size with the fertility, natural or acquired, of the districts in which it has been naturalised. It was on the basis of this widely-spread race, that Bakewell reared the beautiful breed of Dishley, which spread over the midland counties, and extended its influence by crossing the older and coarser varieties. The Long-horned Breed is now giving rapid place to others better suited to the purposes of the breeder, the grazier, and the consumer.

"19. The Teeswater Short-horned or Durham Breed, derived immediately from the district of the Tees, and perfected by Charles and Robert Colling, in the county of Durham. This breed is believed to possess a better combination of properties than any of the larger cattle yet produced in the British Islands, is everywhere extending its limits, and superseding the pre-existing breeds, or modifying their characters by intermixture."

Our next notice of this work will refer to that part of it descriptive of the sheep.

Miscellaneous.

Exhaustion of Land by growing Wheat.—To confine ourselves to Wheat—it appears from the recent researches of Dr. H. Will that 100 parts of the earthy constituents of the grain consist of—

Potass	22 to 34 parts
Soda	16 ,,
Lime	2 to 3 ,,
Magnesia	9 to 13 ,,
Peroxide of iron	1 ,,
Phosphoric acid	49 ,,

A trace of sulphuric acid, silica, and fluorine

whilst the earthy constituents of Wheat straw contain very little phosphoric acid, but a large amount of silica. Now, it is obvious that if the farmer continually restores all the straw to his land, but neglects, from want of knowledge, or means, to replace the earthy matter of the grain, the land will be exhausted, and he cannot continue to grow Wheat upon it. Moreover, if he make an effort to maintain the fertility of the land for Wheat, he must restore to it every ingredient of which it becomes exhausted by his crop in a proper proportion. To know this proportion essential to the growth of every particular crop, he must have recourse to information supplied by Chemistry. One of the earthy constituents of Wheat enters so largely into many other crops, that the amount taken off the land everywhere is very great, and constitutes a considerable proportion of the total amount contained in ordinary land, so that the loss has already, even in the present state of science, excited attention, and aroused the efforts of the farmer to repair it. We allude to phosphoric acid. Now, the chemist has shown, that in the bones of animals a great part of this material which has been drawn from land in the growth of vegetables is to be found, stored up in a form suitable for its restoration.—*Proposal for establishing a College of Chemistry.*

Notices to Correspondents.

AGRICULTURAL STATISTICS—*J S*—The average rent of land in England is said to be 18*s.* 10*d.*, and that of Wales, 9*s.* 5*d.*: the average of England and Wales, 17*s.* 8*d.* The produce of Wheat in England and Wales is probably under 21 bushels per acre.

CALCULATION OF AGRICULTURAL PRODUCE BY THE WEIGHT OF A FRACTION—*Mr. Greys*—It is rarely accurate except where the fraction is large; we may shortly be able to illustrate this subject.

CARTS—If *A Subscriber* will favour us with his address, we shall shortly be able to send him working drawings of the Scotch cart. That will be the most satisfactory way of answering his question.

DANIELL'S WHITE MANURE—*J H M*—We are not acquainted with it.

DISEASE OF THE SHEEP—*G B M*—See "Spooner on the Sheep."—*Kehl-sichté*—In the absence of a more detailed account of this disease, we can do no more than recommend the following medicine to be given as soon as the animal is attacked:—Tincture of opium and spirits of nitrous ether, of each a quarter of an ounce, to be mixed with from a quarter to half a pint of olive oil. A seton may also be inserted near the throat.——*Brandt-sichté*—It is certainly essential to keep the diseased sheep apart from the sound ones, and to use the precautions you mention with regard to the places in which they are kept. And you will find further particulars in the book named above. *W C S.* [Will you be kind enough to favour us with your name and address?]

HARROW—*F P B M*—The harrow you refer to is Smith's web-harrow. Inquire of Messrs. Cottam and Hallen, Winsley-street, Oxford-street, London.

PORK—*The Inquirer* wishes to be informed by "D. M." what proportion of sugar (to salt) was used in curing the pork that always kept good for two years.

POTATO DISEASE—*E T*—We have already sown 20 acres of diseased Potato land with Wheat, nothing being done to the land but stirring it with the scarifier. That expresses our opinion of the matter; at the same time we should say that this opinion is not founded upon any precise knowledge of the matter.

POULTRY—*A Breeder of Fowls*—To make capons, see page 91 of a little but useful book—"The Poultry Yard," by Peter Boswell, Greenlaw; published in Glasgow.

SALTING PORK—Will "D. M." be obliging enough to favour "T. France, Ham-hill, near Worcester," with his name and address?

THE PAST HARVEST—*Senex*—So far as our information extends, the past harvest appears to have been generally *below* an average. But, then, it has not come into the hands of the miller and baker so early as most previous harvests have done, and will thus not have to feed us so many months. Our last week's remarks point to the propriety of correspondents supplying us with information on this subject.

*** As usual, many communications have arrived too late.

Markets.

SMITHFIELD, MONDAY, Nov. 24.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	4s	2 to 4s	4	Best Downs & Half-breds	4s	8 to 5s	0
Best Short Horns	3	10	4	2	Best Long-wools	4	6	4	8
Second quality Beasts	3	0	3	8	Ewes and second quality	4	0	4	4
Calves	4	4	5	2	Pigs	3	8	5	0

Beasts, 7534; Sheep, 27,040; Calves, 83; Pigs, 300.

We have a few more Beasts in market to-day, but the demand is equal to the supply, and late prices are fully maintained; there is also a small increase in the number of Sheep, and a little depression in the trade, but lower prices are in very few instances submitted to.—Veal trade is good; the choice qualities being scarce, have made rather over our top quotations.—Pork trade continues steady.

FRIDAY, Nov. 28.

The supply of Beasts is not large, but the demand is limited, owing to a depression in the dead markets; the very best Scots, &c., of which we have not many in market, make nearly 4s 4d, but other descriptions are quite 2d per 8lbs. lower.—Mutton is not very plentiful; we have a slow trade, but do not make any less money.—Good Veal is still dear; a choice Calf being worth quite 5s.—Pork is in demand at former prices.

Beasts, 787; Sheep, 3840; Calves, 164; Pigs, 312.

4½ West Smithfield.

POTATOES.—SOUTHWARK, WATERSIDE, Nov. 24.

We regret to state that we cannot give you a better account of the appearance of Potatoes in this market, and it is distressing to witness the immense sacrifice of property. The greater part of the fleet that arrived at the close of last week and the beginning of this, was in a very damaged state. Several cargoes were abandoned by the consignee, and many other lots were discharged that did not pay the current expenses. The saleable samples of York Reds were sold from 5s to 100s per ton; Regents, 60s to 100s per ton; superior Regents, perfectly free from the disease, 110s to 120s per ton. There is one cargo of Jersey Blues in the market, selling slowly at 75s per ton; saleable Scotch, from 10s to 30s per ton.

COVENT GARDEN, Nov. 29.—There has been little alteration in the prices of Fruit during the week; and the supplies have been well kept up, except of Pine-apples, which are somewhat scarce. Pears are sufficient for the demand, and the same may be said of dessert Apples; but good sorts for kitchen use are scarce. Hothouse Grapes are brought in considerable quantity, and good samples of Portugal and other foreign sorts are also pretty plentiful; Oranges are becoming more abundant; and Nuts of all kinds are rather plentiful. The prices of most kinds of Vegetables are on the rise—a circumstance, no doubt, to be ascribed to the want of good Potatoes, which are much dearer than they were last week. Cabbages, Savoys, and Broccoli, are also dearer, though not scarcer. Brussels Sprouts and other winter greens are likewise getting up in price. Turnips and Carrots are excellent in quality and sufficient for the demand; and some excellent samples of Celery are in the market. Cauliflowers are scarcer, and, in consequence dearer. Endive, Lettuces, and other Salading, are sufficient for the demand. Cut Flowers chiefly consist of Bignonia venusta, Epiphyllums, Heaths, Heliotropes, Cinerarias, Pelargoniums, Camellias, Chinese Primroses, Chrysanthemums, Violets, and Roses.

FRUITS

Pine Apple, per lb., 4*s* to 6*s*	Lemons, per dozen, 1*s* to 2*s*
Grapes, Hothouse, per lb., 2*s* to 4*s*	—— per 100, 7*s* to 16*s*
—— Spanish, per lb., 9*d* to 1*s*	Almonds, per peck, 6*s*
—— Portugal, p. lb., 9*d* to 1*s* 6*d*	Sweet Almonds, per lb., 2*s* 6*d* to 3*s*

MARK-LANE, MONDAY, Nov. 24.

THE supply of English Wheat by land carriage samples this morning was small, and sold readily at 1*s.* to 2*s.* per quarter advance; free foreign was inquired after, and fine Dantzic in bond, also very low qualities, the latter for export; some sales in floating cargoes were also effected.—Best Malting Barley the turn dearer, but secondary qualities very unsaleable even on lower terms.—Beans, also Maple and Dun Peas, and inferior White, are an exceedingly slow sale and rather cheaper; fine boilers maintain our late quotations.—The Oat trade has in a great measure recovered last week's depression, and prices must be noted 6*d.* to 1*s.* per quarter higher.

BRITISH, PER IMPERIAL QUARTER,	*s.*	*s.*		*s.*	*s.*

FRIDAY, Nov. 28.

There was little English Wheat offering on sale this morning, and the trade is firm at Monday's prices; in free, foreign, or bonded very little doing.—Fine Malting Barley maintains our quotations, but inferior is very difficult of disposal.—New Beans are the turn lower.—Old unaltered in value.—Peas of all sorts have declined 1*s.* to 2*s.* per quarter.—The quantity of Oats offering is still considerable and the trade inactive, but late prices are fully supported where sales are effected.

KINGSFORD AND LAY.

TO GENTLEMEN, FLORISTS, AND OTHERS.
FINAL SALE OF FIRST-CLASS DUTCH BULBS AT THE AUCTION MART.

MESSRS. PROTHEROE & MORRIS respectfully announce that the last Sale of FIRST-CLASS DUTCH BULBS for the season will take place at the Auction Mart, Bartholomew-lane, on Thursday, Dec. 4, 1845, at 12 o'clock, consisting of very fine Double and Single Hyacinths, Tulips, Narcissus, Crocus, Jonquil, Anemone, Ranunculus, Iris, &c.; also a Splendid Assortment of Standard and Dwarf ROSES, comprising all the leading varieties. May be viewed the morning of Sale; and Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

DORKING, SURREY.—TO NURSERYMEN.

TO BE DISPOSED OF immediately, the old-established NURSERY BUSINESS OF MR. ROBERT WESTLAND, in an eligible situation at Dorking, fronting the Turnpike-road. The whole of the Stock to be taken at a valuation. The commodious House, with the Seedshop, useful Out-buildings, and Nursery Garden, is let at a moderate Rent, and may be entered upon immediately.
For particulars, apply to Messrs. HART & HART, Solicitors, Dorking, Surrey.

TO BE LET, and may be entered on immediately, a small and compact NURSERY, situate in the centre of the Manufacturing Districts. It comprises Stoves, Greenhouses, and Pits, with Gardener's House, and every other convenience. The Stoves, &c., are planted with Vines in full bearing. There is a pit 90 ft. long, heated with hot water, built within the last three years. Coals are one penny per cwt., and within half a mile of the gardens. The rent is moderate and valuation low. All particulars may be had by applying, post-paid, to W. T. L., Post-office, Wakefield.
This Advertisement will not be repeated.

TO GARDENERS AND NURSERYMEN.

TO BE LET, with immediate possession, close to a Market Town in Suffolk, a neat and comfortable DWELLING HOUSE, and to which can be added a sufficient quantity of excellent Arable Land for a productive Garden and Nursery ground. Satisfactory references will be required.—For further particulars apply to Mr. UTTON, Brome, near Scole, Norfolk.

THE FARMERS OF GREAT BRITAIN are requested to read the pamphlet on "GYPSUM, AS A MANURE:" describing its various important uses for Agricultural purposes, with full and plain directions for its application, and containing an account of numerous cases of its surprising efficacy and cheapness.
The Pamphlet will be sent free to any part of the Kingdom, on receipt of a post-paid application (containing Three Penny Stamps), addressed to NEWTON and PECK, Hull.

GYPSUM.—PURE GYPSUM (in fine powder), in 5-ton lots at 25*s.* per ton in the stream, or 27*s.* 6*d.* per ton delivered. Also Guano (Peruvian and African), Superphosphate of Lime, Bones, Sulphuric Acid, and all other manures of known value, on Sale. By MARK FOTHERGILL, 40, Upper Thames-street, London.

POTATO DISEASE.—COTTAM and HALLEN have now ready at their Agricultural and Horticultural Implement Repository, 2, Winsley-street, Oxford-street, London, POTATO PULPING MACHINES for extracting the Starch and all other parts of the Potato which remain uninjured by the disease. These Machines are highly approved of by all who have seen and used them, as being the most effectual that can be made for the purpose.

LIQUID MANURE.
ENGLAND INDEPENDENT OF THE WORLD FOR CORN.
THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps: also those for Distillers, Brewers, Soap Boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.
The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

THRASHING MACHINES, made Warranted not to Damage the Straw.—Mrs. MARY WEDLAKE, Widow of the late Mr. THOMAS WEDLAKE, of the original Fairkytes Iron Works, Essex, and 118, Fenchurch-street, opposite Mark-lane, City, established upwards of 40 years, begs respectfully to remind Agriculturists that she continues to manufacture those excellent Machines, made, and first introduced, by her late husband these 30 years, and now much improved. Warranted not to damage the Straw. Numerous references to parties using the Implement may be had.
Patent light Ploughs, and Superior Dressing Machines, also Patent Chaff-cutting Machines made on scientific principles, may be seen at 118, Fenchurch-street, repository opposite Mark-lane: also, Horse-Rake, and DINGLE'S new Hand Dibbing-Machine so much approved of. City Repository for Agricultural Implements, 118, Fenchurch-street, opposite Mark-lane.

SMITHFIELD CATTLE SHOW.
DRAINING TILES.—At the approaching Cattle Show in Baker-street, will be shown
AINSLIE'S PATENT IMPROVEMENTS
In MAKING and DRYING Draining Tiles of the FIRST CLASS.—Gentlemen having works in operation, or who are about to erect them, will find the above worthy their attention.
The PROCESS combines EFFECT with ECONOMY, as Tiles can be made ready for BURNING at all seasons; generally from ten to thirty hours, according to the nature of the clay. To be seen at Alperton, Acton, Middlesex; Mr. HOWE, Engineer, 9, Great Guildford-st., Southwark; the Polytechnic Institution, Regent-street, London. Particulars may be had from JOHN AINSLIE, Alperton, Acton, Middlesex.

SMITHFIELD CATTLE SHOW.
W. SKIRVING begs to acquaint his friends and the public, that he will attend at the ensuing Smithfield Cattle Show, to exhibit roots of his IMPROVED SWEDE TURNIP, and take orders for the Seed of it, and all other approved kinds of Agricultural Seeds.
W. S. having of late years enlarged his Nursery, to an extent beyond any precedent in England, has now on hand a most extensive stock of Trees and Shrubs of every kind, and will be happy to treat with gentlemen about to plant, on the most liberal terms.—Walton Nursery, Liverpool, Nov. 29.

CAUTION.—SMITHFIELD CATTLE SHOW.
MRS. MARY WEDLAKE, widow of the late Thomas Wedlake, respectfully reminds her friends and the agriculturists generally, that she will exhibit this year SEVERAL USEFUL MACHINES, at the Horse Bazaar, Baker-street, which must attract the attention of those who are anxious to avail themselves of the assistance of first-rate finished agricultural machinery, combining utility, economy, and durability.
London Warehouse, 118, Fenchurch-st., opposite Mark-lane.
N.B.—No connection with any other house. Please to observe the name, "MARY WEDLAKE."

THE ARCHÆOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.

CENTRAL COMMITTEE, October 6, 1845.

PRESIDENT.—THE MOST NOBLE THE MARQUIS OF NORTHAMPTON.

Rev. THOMAS WORSLEY, M.A. Master of Downing College, Cambridge.

Editor of the Publications of the ARCHÆOLOGICAL INSTITUTE and Resident Secretary, T. HUDSON TURNER, Esq. Hon. Member Ant. Soc. of Newcastle.

THE ARCHÆOLOGICAL INSTITUTE of Great Britain and Ireland is formed in order to examine, preserve, and illustrate all Ancient Monuments of the History, Manners, Customs, and Arts of our Forefathers.

The means by which the Central Committee propose to effect this object are—

1. By holding communication with correspondents throughout the Kingdom, and with provincial Antiquarian or Architectural Societies; as well as by direct intercourse with the Comité des Arts et Monuments of the Ministry of Public Instruction in France, and with other Associations on the Continent instituted for the advancement of Antiquarian Science.

2. By holding frequent and regular meetings for the consideration and discussion of communications received from correspondents and other persons.

3. By procuring careful observation and preservation of Antiquities discovered in the progress of Public Works, such as railways, foundations of buildings, &c.

4. By encouraging individuals, or public bodies, in making researches and excavations, and affording them suggestions and co-operation.

5. By opposing and preventing, as far as may be practicable, any injuries with which Ancient National Monuments of every description may from time to time be threatened.

6. By using every endeavour to spread abroad a correct taste for Archæology, and a just appreciation of Monuments of Ancient Art.

7. By collecting accurate drawings, plans, and descriptions of Ancient National Monuments, and by means of correspondents preserving authentic memorials of antiquities which may from time to time be brought to light.

8. By establishing a Journal devoted exclusively to the objects of the Institute, as a means of spreading antiquarian information, and maintaining a constant communication with all persons interested in such pursuits.

9. By taking every occasion which may present itself to call the attention of the Government to the conservation of our National Monuments, and to the other objects of the Institute.

RULES AND REGULATIONS OF THE ARCHÆOLOGICAL INSTITUTE.

I. THE ARCHÆOLOGICAL INSTITUTE of Great Britain and Ireland shall consist of Life Members, contributing a donation of not less than 10*l.*, of Annual Members contributing not less than 1*l.* each year, and of Corresponding Members who, taking an interest in the objects of the Institute, and being disposed to give furtherance to them without any pecuniary contribution, may desire to attach themselves to the Institute. The Corresponding Members shall not be entitled to vote, nor have any other privileges.

II. The Government of the Institute shall be vested in a Central Committee, consisting of a President, four Vice-Presidents, three Honorary Secretaries, a Treasurer, and twenty-four ordinary Members.

III. The President's tenure of office shall be for one year.

IV. The Honorary Secretaries and Treasurer shall be elected by the Committee, who shall also have the power of electing a Secretary, at such a salary as they may consider proper.

V. The Election of the President, Vice-Presidents, and Members of the Central Committee shall be made by the ballot of the Life and Annual Members at the Annual Meeting. The Committee shall select one Vice-President and six members of their body, who are to go out annually, and shall nominate one Vice-President, and six other Members to fill up the vacancies. The names of those who go out, and of those who are proposed to supply their places, shall be hung up in the Local Committee Room during the whole time of the Annual Meeting, and a printed copy of such lists furnished to each Member of the Institute, with his ticket for the Annual Meeting. No Member of the Committee, except the Honorary Secretaries and Treasurer, shall remain on the Committee more than four years, or be eligible to serve again until after the lapse of one year. Any Member of the Institute is at liberty to substitute on the list other name or names for those proposed by the Committee.

VI. The Committee shall be empowered to fill up *pro tem.* by election all occasional vacancies that may be caused by the death or resignation of the President, or any of the Vice-Presidents or ordinary Members of the Committee.

VII. These vacancies shall be supplied on the recommendation of at least three Members of the Committee, made in writing at one of the ordinary Meetings: the proposed Member to be balloted for at the succeeding ordinary Meeting.

VIII. The Annual Meeting shall be holden in one of the cities or principal towns in the kingdom, at which the elections, the appointment of the place of meeting for the ensuing year, &c., shall take place. Notice of this Meeting shall be given by one of the Honorary Secretaries, by order of the Committee.

IX. The Committee shall have the power of nominating a certain number of Local Vice-Presidents.

X. No other General Meeting of the Institute shall be holden without the consent of at least three-fourths of the Committee, expressed in writing: for such Special Meeting, a notice of at least three weeks shall be given by advertisements in the public papers. At this Special Meeting, the President, or, in his absence, one of the Vice-Presidents, shall take the chair, and, in their absence, the Committee shall appoint a Chairman.

XI. Neither at the General Annual Meeting, nor at any Special General Meeting, shall any alteration of, or addition to, any of the Rules or Regulations of the Institute be submitted to the Meeting, unless upon a proposal in the form of a resolution in writing, signed by two Life or Annual Members: which shall have been sent to the Committee one month previous to the Meeting, and suspended in their committee-room.

The Summons for the Special General Meeting shall specify the Resolution or Resolutions to be submitted to the Meeting, and the discussion shall be confined to that object only: in case such proposed Resolution or Resolutions shall be carried, another Special General Meeting shall be summoned by the Committee after the lapse of not less than a fortnight, or more than a Month, for the sole purpose of ratifying or rejecting such Resolution. If, however, the first-mentioned Special Meeting take place at a time not more than two Months before the Annual Meeting, then such Resolution or Resolutions shall be ratified or rejected at that Annual Meeting.

XII. The Chairman of the Annual, or any other General Meeting, shall have an Independent as well as a Casting Vote.

XIII. A certain number of persons, not usually resident in London, shall be associated with the Central Committee as Honorary Members of that Body, and shall be entitled to a Vote at their Meetings. Such Honorary Members shall be proposed on the recommendation of at least three Members of the Committee, and the Election shall take place at the succeeding Ordinary Meeting.

XIV. The Committee shall appoint a certain number of persons, not resident in London, as their Local Secretaries.

XV. The Election of Local Secretaries and Corresponding Members shall be made by the Committee on the proposal of one of the Members thereof, either on his own personal knowledge or on the recommendation of two subscribing Members of the Institute.

XVI. In these and all other Elections made by the Committee, it shall be allowable for any Member thereof to demand a Ballot.

XVII. Subscriptions and Donations may be paid to the Treasurer, to any Member of the Committee, or to the Account of the Archæological Institute with the Bankers of the Institute, and no Subscriber shall be entitled to Vote at the Annual Meeting who has not paid his Subscription. The Year shall be considered as closing with the termination of the Annual Meeting; from which time the Subscription for the ensuing year shall become due.

XVIII. The Cash Book, and an account of all Receipts and of the Balance in the Bankers' hands, shall be laid on the table at each Meeting of the Central Committee. All Bills having been duly examined, and approved in writing, shall be paid by Cheque upon the Bankers, signed by the Treasurer.

XIX. The Accounts of the Institute shall be submitted Annually to two Auditors, who shall be elected for that purpose by the Members of the Institute at the General Meeting, and who shall attest by their Signatures the accuracy of the said Accounts. The Accounts having been thus approved, shall be submitted to an Annual Meeting of the Committee, to be holden on the First Wednesday in May, and shall be printed and published in the Journal of the Institute as part of the proceedings of the Committee.

XX. A Report of the Proceedings of the whole year shall be submitted to the Annual Meeting.

XXI. The Central Committee shall be empowered to make such Bye-Laws as may, from time to time, appear to them expedient.

The Central Committee request the Local Secretaries to attend, whenever it may suit their convenience, the Ordinary Meetings, which take place once in every fortnight at the apartments of the Institute, 12, Haymarket, for the discussion of Archæological communications and the exhibition of objects of interest.

ORDINARY MEETINGS OF THE CENTRAL COMMITTEE:—

12, HAYMARKET. *The Chair will be taken at Four o'clock.* Mondays, November 24; December 8.

Subscriptions may be paid to the Bankers, Messrs. COCKBURNS, 4, Whitehall. All communications should be addressed to T. HUDSON TURNER, Esq. 12, Haymarket.

IMPROVED DIBBLING MACHINE.

JOHN WEATHERSTONE begs to inform the Agricultural Public that his PATENT HORSE-DIBBLING MACHINE is now ready, whereby the greatest regularity may be insured in the deposition of all Seeds. A team of four horses will be found sufficient power to draw one of the largest size.

Price of Machine, with six rows..... £35
" eight rows..... 40
" ten rows..... 45

Applications for further particulars may be made to Mr. JOHN WEATHERSTONE, Cassington, near Oxford; or to Messrs. GILL and WARD, High-street, Oxford.—Agents wanted in all parts of the country.

CHEAP AND DURABLE ROOFING,
AND THE BEST RESISTER OF FROST FOR GARDEN PURPOSES.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers and only Patentees of THE PATENT ASPHALTED FELT FOR ROOFING, and which for many years has been in extensive use for Roofing Houses, Verandahs, all kinds of Farm Buildings, Sheds, and for COVERING GARDEN FRAMES, TO PROTECT PLANTS AGAINST THE EFFECTS OF THE FROST, beg to call the attention of Gardeners and others to their superior article, *which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and obtained the Prize for being the best and cheapest article for roofing, &c.*, and is also patronized by Her Majesty's Board of Ordnance, Commissioners of Woods and Forests, the Hon. the East India Company, and the Botanical Gardens, Regent's-park. It is extensively used in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference is made. This Felt is composed of the strongest and most durable materials, and is saturated with the BEST OF ASPHALTE OR BITUMEN (THE SAME AS SELECTED AND USED BY SIR ISAMBERT BRUNEL FOR THE THAMES TUNNEL, BEING FOUND THE MOST ELASTIC AND EFFECTIVE RESISTER OF WET). NO OTHER FELT HAS THIS ASPHALTE BUT F. M'NEILL & CO.'s, and which renders it impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy. — Price ONLY ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience (which contain much useful information), from Noblemen, Gentlemen, Gardeners, Architects, and Builders, SENT FREE to any part of the Town or Country, and orders by Post executed.

The new Vice-Chancellor's Courts, the Offices attached, and Passages leading to Westminster-hall, Dr. Reid's Offices, and other Buildings at the New Houses of Parliament, are roofed with F. M'NEILL and Co.'s Felt, and is known by its having the appearance of lead roofs.

☞ The Public are respectfully cautioned against misrepresentation, as the only Works in Great Britain where the above Patent Roofing is made, is F. M'NEILL & Co.'s Manufactories, Lamb's-buildings, Bunhill-row, London.

CORN LAWS.—Third Edition, now ready, price 2*s*.

London: JAMES RIDGWAY, Piccadilly.

THE CORN AND PROVISION TRADES.—The deficiency of the Harvest, the failure of the Potato Crop, and the consequent serious effects upon commercial and monetary affairs, excite great apprehension. Under such circumstances, correct information as to the produce of the harvest, the extent of the failure of the Potato Crop, the state of the markets, the stock of grain on hand, on the continent of Europe, and in the United States, is of the highest importance. No trouble or expense is spared to furnish such information, which is brought down to the latest moment of going to press, in the MARK-LANE EXPRESS, which has been for many years the authority in the Corn and Provision Trades in England and in foreign countries. Published every Monday in time for post, and may be had by order of all Booksellers, Newsmen, &c. Office, No. 24, Norfolk-street, Strand. Price 1*l*. 10*s*. 4*d*. per annum.

THE TENANT FARMERS' ADVOCATE.—It is abundantly manifest that the position of the Agricultural Interest as a class is undergoing and must undergo a great change. In such change the relative position of "LANDLORD AND TENANT" will form the most important feature, and the establishment of a sound system of "Tenants' Rights" will be a cardinal point for "Tenant Farmers." For 14 years THE MARK-LANE EXPRESS AND AGRICULTURAL JOURNAL has been the zealous and uncompromising advocate of the TENANTS' RIGHTS, and with the conviction that the interests of the Tenantry are vitally involved in the question, the columns of this Journal will be continuously devoted to its discussion and elucidation. Published every Monday in time for Post. May be had by order of all Booksellers and Newsmen.—Office, 24, Norfolk-street, Strand, London. Price 1*l*. 10*s*. 4*d*. per annum.

ON THE FIRST OF EVERY MONTH, PRICE ONE SHILLING,

THE RAILWAY DRAGON,
By GEORGE CRUIKSHANK.

London: Published at the Office of the TABLE BOOK, 92, Fleet-street.

On the 1st of January, 1846 (to be continued Quarterly), will be published PART I. of

THE JOURNAL OF THE HORTICULTURAL SOCIETY OF LONDON, containing 96 pages in 8vo with one Coloured Plate and other Illustrations, price 5*s*.

In this work it is intended to publish periodically an account of the Proceedings of the Society, the Journals of the Society's Collectors, Papers on Horticultural Practice, or Subjects connected with Gardening, Reports upon the new Esculents, Fruits, or ornamental Plants, that may be from time to time introduced, an account of all Experiments tried in the Garden, and such other matter bearing upon Horticulture as may appear interesting to the Public. It will be distributed gratuitously to the Fellows of the Society, instead of the 4to Transactions; which will be discontinued after the completion of the current volume.

Fellows, Corresponding Members, and others, are invited to forward communications upon all matters *of either theory or practice*, to the Vice Secretary, at the House of the Society, 21, Regent-street, London.

MR. GOADBY having discovered a mode of preserving objects of NATURAL HISTORY, and especially the soft Invertebrata, with a success not before obtained, and having spent the greater part of his life in perfecting the display of the structure of Insects, Mollusca, and other Invertebrata, has formed a collection of such preparations, which he is now, in consequence of the state of his health and other reasons, desirous to dispose of for 500*l*. This sum, which is much below its actual value, it is proposed to raise by subscription, in order that the Collection may be presented to some Public Museum. Mr. GOADBY has made known his processes and preserving fluids through the medium of the British Association, at the meetings of which body, as well as at other public assemblies, the specimens have been exhibited; and the value of both the processes and results has been fully recognised by Naturalists and Comparative Anatomists.

Several specimens in Mr. GOADBY's Collection are the result of many months' assiduous labour, and are unique. The number of the specimens is upwards of 150.

A CATALOGUE OF THE FRUITS CULTIVATED IN THE GARDEN OF THE HORTICULTURAL SOCIETY OF LONDON. Third edition, containing the Names, Synonymes, Colour, Size, Form, Quality, Use, Time of Ripening, and many other particulars concerning all the most important varieties of hardy Fruit cultivated in this Country.

Sold at the House of the Society, 21, Regent-street, and also by LONGMAN & Co., Paternoster-row; J. HATCHARD, Piccadilly; RIDGWAY, Piccadilly; RIVINGTONS, Waterloo-place and by the principal Booksellers in all parts of the Empire. Price 3*s*. 6*d*. to Fellows of the Society, and 5*s*. to others (or, postage free, upon receipt of a Post-office order, price 5*s*. to Fellows of the Society, or 6*s*. 6*d*. to others).

ELEGANT PRESENT.

On the 11th of December will be published, price 16*s*.,

THE ANNALS OF HORTICULTURE, handsomely bound in arabesque, richly gilt, containing 133 engravings, a beautifully-coloured frontispiece, and 350 pages of original information on Gardening and Planting including the culture and management of all popular Flowers, and Flowering Shrubs.

HOULSTON and STONEMAN, Paternoster-row; W. WHITE and Co., Edinburgh; W. CURRY and Co., Dublin. Orders received by all Booksellers.

EVENINGS WITH THE GREAT COMPOSERS.

THE SUCCESS which has attended the Lectures delivered by Mr. HENRY LINCOLN, at various Literary Institutions, the crowded audiences by which they have been honoured, and the approbation with which they have been received, alike by the public and the press, lead to the inference that there is a large body of intelligent persons who are desirous of becoming acquainted with the Great Works of the Great Masters. Mr. LINCOLN therefore proposes to give a series of

LECTURES, WITH MUSICAL ILLUSTRATIONS,
AT THE
WESTERN INSTITUTION, LEICESTER-SQUARE,

in which he will, each evening, offer an outline of the Musical life and labours of one or other of these great men, tracing the development of his powers, marking his peculiarities and characteristics, with such Vocal and Instrumental Illustrations as may best tend to elucidate the subject, and gratify and satisfy a cultivated and refined taste. Mr. LINCOLN proposes in the first instance to devote four evenings—

Dec. 2nd 9th, 16th, and 23d Dec. to

Haydn. Cherubini. Cimarosa. Mendelssohn.

This Series will be followed by Evenings devoted to Bach, Beethoven, Boieldieu, Gluck, Gretry, Handel, Jomelli, Meyerbeer, Mozart, Paiesiello, Purcell, Schubert, Spohr, Spontini, Weber, and others—the Master Minds of Europe, various in power and originality, but all of great interest:—some only known by name in England, many only known for one or two works, not one in all the infinite variety in which his genius made itself manifest.

On Tuesday next, December 2.
HAYDN.

Illustrations.

PART I.

First Movement of a Violin Quartett	Messrs. DANDO, GOFFRIE, HILL, and BANISTER
"Oh, tuneful Voice"	Miss CUBITT
First Movement of a Sonata (Pianoforte)	Mr. LINCOLN

ROWLAND'S UNIQUE PREPARATIONS.—(Under the Patronage of the several Sovereigns and Courts of Europe, and universally preferred.)—ROWLAND'S MACASSAR OIL, for the Growth, Preservation, and for Beautifying the Human Hair.—Price, 3*s*. 6*d*.—7*s*.; family bottles (equal to four small) 10*s*. 6*d*., and double that size, 21*s*. per bottle.

ROWLAND'S KALYDOR, for improving and beautifying the Skin and Complexion.—Price, 4*s*. 6*d*. and 8*s*. 6*d*. per bottle, duty included.

ROWLAND'S ODONTO, or Pearl Dentifrice, for the Teeth and Gums.—Price, 2*s*. 9*d*. per box, duty included.

CAUTION.—SPURIOUS COMPOUNDS are frequently offered for sale, under the same names, (some under the implied sanction of Royalty,) the Labels, Bills, and Advertisements of the original articles are copied, and either a FICTITIOUS NAME, or the word "GENUINE," is used in the place of "ROWLAND'S." It is therefore imperative on purchasers to see that the word "ROWLAND'S" is on the Wrapper of each Article. For the protection of the Public from fraud and imposition, the Hon. Commissioners of Stamps have directed the Proprietors' signature to be engraved on the Government Stamp, thus—

A. ROWLAND AND SON, 20, HATTON GARDEN.

Which is affixed on the KALYDOR and ODONTO.

Sold by the Proprietors, and by most Chemists and Perfumers.

*** All others are FRAUDULENT COUNTERFEITS.

Printed by WILLIAM BRADBURY, of No. 6, York-place, Stoke Newington, and FREDERICK MULLETT EVANS of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles street, in the parish of St. Paul's, Covent Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday November 29, 1845.

VERONICA "LINDLEYANA."

R. GLENDINNING can supply strong plants of the true species of this ELEGANT HARDY GREENHOUSE PLANT (which is figured in Paxton's "Magazine of Botany" for the present month), at 5*s*. each. One will be allowed on every Three ordered by the Trade.

Chiswick Nursery, near London, Dec. 6.

SPLENDID NEW WHITE FUCHSIA.

WM. JACKSON & Co., Nurserymen, have great pleasure in informing the Floricultural Public generally, that they possess a WHITE FUCHSIA of exquisite beauty; the flower is between three and four inches in length, with a rich purple corolla, which opens well; the plant is a robust grower, and a most profuse bloomer. For Dr. Lindley's remarks, see last week's *Chronicle*, page 804, "Seedling Flowers—W. J. & Co." Good plants will be ready to send out next spring.—Cross-lanes Nursery, Bedale Yorkshire, Dec. 6.

TO THE ADMIRERS OF THE HOLLYHOCK.

WM. CAKEBREAD has a few hundred plants of the fine Pink or Rose and of the Red-coloured HOLLYHOCK to dispose of; which he can warrant, for doubleness and beauty of colour, not to be surpassed by any other varieties known. In small quantities, 6*d*. a plant; or 2*l*. per 100.—Silverstone, near Towcester, Northamptonshire.

SUPERIOR NEW EARLY PEA.—WARNER'S "EARLY EMPEROR" Pea, the earliest in cultivation, quite hardy, a good Cropper, with fine Pods, and most delicious flavour. Height about 2 ft.—5*s*. per quart.—To be had of Warner and Warner, Seedsmen, 28, Cornhill, London.

LEE'S DWARF ITALIAN MARROW PEA.

J. AND C. LEE intend sending out the above new PEA this season, and having grown the Stock for the last five years, they can strongly recommend it as a distinct and most excellent variety. Its habit is exceedingly dwarf and robust: it is a very prolific bearer, and the Pea is equal in size to the largest Marrowfat, and is of most delicious flavour. It comes in earlier than any other Marrow. It has been grown in the gardens of Clumber, Welbeck, Thoresby, Nuneham, Tottenham-park, and Tedworth, and is highly extolled by the Gardeners of these places. In Quart Packets, sealed, price 5*s*.

Nursery, Hammersmith.

ROSE D'AMOUR.—ROYAL NURSERY, SLOUGH.

W. C. BROWN begs to say he is sending out strong ground roots of this beautiful Light DAHLIA at £5 5*s*. each, its colour Rosy Peach, shell petal, forming a most pleasing outline; fine habit, height 4 feet, and in every respect a most desirable flower, having excited great attention at Stonehenge, Staines, and other shows, and for which W. C. B. has already many orders. W. C. B. has a large stock of Pot Roots of all the good kinds from 2*s*. 6*d*. to 10*s*. His Dahlia list will comprise all the new and good flowers, and may be had on application after Christmas.

VICTORIA NURSERY, CORK.—FOREST TREES.

J. & H. HAYCROFT can deliver free at any of the undermentioned ports, strong transplanted LARCH, 2 to 3 feet high, at 15*s*. per 1000, and 3 to 4 feet high at 18*s*. per 1000: also small LARCH 9 to 15 inches high (fit for planting in clean ground) at 7*s*. 6*d*. per 1000. By steam-vessels to London in four days, to Liverpool, Bristol, and Plymouth, in 30 hours, and by sailing vessels to Newport, Cardiff, Neath, Swansea, and nearly every port in South Wales.

BRACONDALE HORTICULTURAL ESTABLISHMENT.
TRUE "FASTOLFF" RASPBERRY.

JOHN BELL begs to inform his friends and the public he continues to supply the above RASPBERRY. The trade supplied on liberal terms when large quantities are taken.

J. B has a very Extensive Collection of Standard and Dwarf ROSES, fine strong plants, at the following prices, the selection being left to J. B.

JAMES CARTER, Seedsman and Florist, No. 238, High Holborn, London.

*** A new and extensive Catalogue of Culinary and Floricultural Seeds is in preparation.

GREAT YARMOUTH NURSERY, NORFOLK.

YOUELL and CO. beg to offer the following good and desirable plants to the notice of their Friends and Amateurs, feeling assured from their well known mode of executing all orders, that those favouring them with their commands will receive none but articles of the very best quality.

Superb new heavy-edged PURPLE PICOTEE, "BURROUGHES'S PRESIDENT," 15*s*. per pair. For particulars, see *Gard. Chron.* of 11th Oct.

Also, "BURROUGHES'S DUKE OF NEWCASTLE," the best light-edged Purple Picotee, 15*s*. per pair.

CARNATIONS AND PICOTEES.

				£	*s*.	*d*.
12 pairs extra fine and very superior first-class Show Flowers, by name				2	10	0

RIBES SANGUINEUM FLORE PLENO, 10*s*. 6*d*. per plant.
MYATT'S "BRITISH QUEEN," STRAWBERRY, 5*s*. per 100.
"PRINCESS ALICE MAUDE," „ 10*s*. „
YOUELL'S CELEBRATED TOBOLSK RHUBARB, fine transparent pink, the best for forcing, 12*s*. per dozen. Roots placed in a cellar or closet now will be fit for cutting in January.

Great Yarmouth Nursery, Dec. 6.

NEW SEEDLING POTATO, called the "CHALMORE KIDNEY," has received several first prizes; is a prolific bearer, mealy, and of a very superior flavour; is highly spoken of in the *Gardeners' Chronicle* of Nov. 1, 1845. May be had of Tyso and Son, Florists, Wallingford, Berks; and of Warner and Warner, 28, Cornhill, London. Price 2*s*. per gallon, or 3*s*. 6*d*. per peck.

FLORISTS' FLOWERS.

Messrs. TYSO and SONS' descriptive priced Catalogue of RANUNCULUSES, TULIPS, ANEMONES, CARNATIONS, PICOTEES, PINKS, &c., for 1845-6; and a full description of the "CHALMORE KIDNEY" will be sent free on receipt of two postage labels.

WHALE'S NEW SEEDLING DAHLIAS FOR 1846.

W. B. Whale begs leave to call the attention of the Floricultural world generally to his new and select Seedlings for 1846. W. B. W. trusts that his long experience in Floriculture has enabled him to select only those varieties from a number of thousands of Seedlings, that will give general satisfaction to his numerous customers.

WHALE'S "MARCHIONESS OF CORNWALLIS."—Ambient white, very pure white when shaded, very superior petals, falling in close column below each other, which, together with a fine, rising, well-developed centre, gives the flower a most perfect symmetrical character, the petals perfectly smooth and thickly set, with fine arrangement, requiring no dressing, the habit is early, a profuse bloomer, height 3 feet, strong plants in May, price .. .. 10*s*. 6*d*.

In consequence of the dangerous state of the roots—raising with canker, and scarcely any tubers—it is necessary to secure plants by early orders: these facts and the above properties are warranted. The probable results of its merits may be best appreciated by its being the most successful flower of the season, pronounced by the first judges of the day, (Messrs. Glenny and Co.), at all the principal Exhibitions. Prizes awarded, 1845:—First Prize at Cambridge, beating all the favourites of the season. First at Exeter against all England. First-class Prize Certificate at Chelmsford, Essex, where Mr. Glenny pronounced it a trimmer. First-class Prize Certificate at Bath, open to all England. First-class Prize Certificate, Stonehenge, Salisbury Plain. Three blooms were sent to the South London Show, Sept. 17, instead of four, in mistake, consequently it was thrown out, though greatly admired. First-class Prize Certificate at the Great Metropolitan Show, Cremorne House, 6 blooms, Sept. 25. The blooms were stale; not in that state of perfection that W. B. W. could have wished, in consequence of all the plants, flowers, &c., being destroyed on the 23rd of September by frost, which prevented W. B. W. from exhibiting the following Seedlings, viz.:—

WHALE'S ROSE UNIQUE—A splendid silver Rose, superior petals, well arranged, and perfect outline, and very constant through the season. Height 4 feet .. .. .. 10*s*. 6*d*.

WHALE'S SCARLET UNIQUE—A perfect model, very constant through the season, and profuse bloomer; occasionally shows a floret. Height 3 feet .. .. 10*s*. 6*d*.

WHALE'S "HENRY BURN"—A vermilion scarlet; a decided improvement on Catleugh's Eclipse. Petals well set, of medium size, nearly constant. Height 4 feet .. 7*s*. 6*d*.

WHALE'S "ATTRACTION"—Quite new in colour—bright orange, tipped with buff; a good back row flower, and very constant. Height 4 feet .. .. 7*s*. 6*d*.

WHALE'S "ADMIRATION"—A Seedling of 1843, kept in last season in consequence of the stock being nearly lost, after receiving orders for nearly 50 dozen plants. Orange, margined with bright scarlet: quite new in colour: petals thickly set, with good arrangement; perfectly constant—has now been proved three seasons. Height 4 feet .. .. .. 10*s*. 6*d*.

WHALE'S SEEDLING FANCY BORDER VARIETIES for 1846.

WHALE'S "MADAME LEVETT"—Dark marone, tipped with white; a profuse bloomer, and constant. Height 3 feet, 5*s*.

WHALE'S "BEAUTY"—Rose pink, tipped with gold, very pretty. Height 4 feet, only two roots .. .. .. 7*s*. 6*d*.

WHALE'S "RANUNCULA FLORA"—Primrose ground, tipped with Cherry, quite new in colour, a most perfect symmetrical shape, quite a novelty, but too small for a Show variety, or nothing could excel it: a profuse bloomer. Height 4 feet .. .. 5*s*.

No discount unless 6 or more plants are ordered. Dry roots of most varieties in cultivation may be had of W. B. W. at reasonable prices.

Kintbury or Elcot, near Hungerford, Berks., Dec. 6.

TO THE PLANTERS OF ENGLAND AND LOVERS OF THE PICTURESQUE.

JAMES GRIGOR, Nurseryman, Norwich, begs to state that he is now sending out plants of the True HIGHLAND PINE, a noble landscape ornament, and a tree which produces very superior timber.

"I very particularly admire the Highland Pine; its growth, and leaf, and bark, are beautiful. I shall be truly proud of my first specimens, of which I beg you will send me 1000 of your finest for trial. I am very much obliged to you for calling my attention to trees of such value."—*Newcastle (Duke of), Clumber, December 2*, 1844.

"Now that we are on the subject of trees, I may mention what I have very likely told you in some of my previous letters, that I prefer the Highland Pine to all other trees except the Oak, taking into consideration its beauty in winter, and by moonlight, and in the evening."—*Wm. Wordsworth, Rydal Mount, Dec. 7*, 1844. Who, then, would be without this tree?

Plants	1 to 2 inches	.....	5*s*. per 1000	
„	2 to 4	„	10*s*.	„
„	4 to 6	„	15*s*.	„
„	6 to 8	„	20*s*.	„

„	12 to 15 very strong. 5*s*. per 100.			

Finest picked Plants 4*d*. each, Ditto in pots 6*d*.

Norwich, December 6, 1845.

TO NURSERYMEN, FLORISTS, and the TRADE in General.

WM. WOOD and SON'S WHOLESALE CATALOGUE of ROSES, GREENHOUSE PLANTS, &c. may still be had, GRATIS, on application, and will be found to contain many of the leading varieties at very moderate prices.

Woodlands Nursery, Marestield, near Uckfield, Sussex.

NE PLUS ULTRA PEAS, grown by Wm. Brownlees, Nurseryman, Hemel Hempstead, Herts, and sold by him at 5*s*. per quart, the stock on hand being very small. The above Pea is a tall Marrow, of a very superior quality, and most abundant bearer. It is about the same size as the British Queen Pea, but comes into bearing 14 days sooner, and is fit for use four or five weeks later. It should be sown thinly, and requires tall sticks.

A remittance is requested from unknown correspondents.

It may also be had of Messrs. W. & J. Noble, Seedsmen, 152, Fleet-street, London, by whom it can be well recommended.

THE TRUE FASTOLFF RASPBERRY.

GREAT YARMOUTH NURSERY. NORFOLK, 1845.

YOUELL & CO., being the parties who first introduced to the notice of the Horticultural world the above truly excellent Raspberry, unequalled for the size of its fruit and richness of flavour, and possessing an extensive Stock of fine Canes, beg to offer the same upon the following terms, guaranteed to be of the same quality as those they had the honour of supplying Her Most Gracious Majesty the Queen, His Grace the Duke of Northumberland, His Grace the Duke of Rutland, His Grace the Duke of Marlborough, the Earl of Harrington, the Earl of Liverpool, the Earl of Abergavenny, the Earl of Egremont, the Lord Bishop of London, Lord Viscount Lorton, Lord Sondes, and most of the Nobility, as well as the Horticultural Society of London, the latter having awarded YOUELL & Co. two prizes for it.

Packages containing 100 canes	.	£1	4 0
Do. do. 50 do.	. .	0	13 0
Do. do. 25 do.	. .	0	7 0

A liberal discount will be allowed the Trade when "quantities" are ordered.—Great Yarmouth Nursery, Dec. 6.

Josephus	.. ..	1	1

The Set of Six, 5l. 10s. Cash, 5l.

The following 12 sorts, as sent out last season at 10l. 10s., the set may be had for 3l. 3s., or cash, 3l. :—Titus, Pompey, Champion, Unique, Queen of England, Claude, Amelia, Majestica, General Pollock, Flora, Rosalia, Sarah Jane.

Package free, and in either case a choice Plant will be put to defray the carriage.

WILLIAM MILLER, Providence Nursery, Ramsgate.

MITCHELL'S FIRST-RATE DAHLIAS FOR 1846.

JAMES MITCHELL begs respectfully to announce his intention of sending out the first week in May the following Superb and Distinct DAHLIAS, which he can with confidence recommend.

MERRY MONARCH—beautiful shaded rose, quite new in colour, obtained a first-class Certificate at the Grand Show at Slough; is a most noble and constant show flower, 4 ft., 10s. 6d.

ERECTUM—fine crimson, obtained the first prize at Tonbridge Wells, and is a constant show flower, 4 feet, 10s. 6d.

LADY CHARLEVILLE—Seedling of 1844, partially let out last season. J. M. exhibited three blooms at the Grand Show, Slough, but not for competition. It was pronounced the best flower of the season by the first Metropolitan amateur growers—colour, rosy pink, 4 feet, 7s. 6d.

MARIE LOUISE—Maroon, tipped with white, fine fancy variety, 3 feet, 7s. 6d.

DAWN OF DAY and GOLIAH—These two varieties J.M. purchased of J. V. Shelley, Esq., Maresfield, Park. Dawn of Day, beautiful pink, pronounced a first-class show flower by the Metropolitan Judges, 3 feet, 10s. 6d. Goliah, dark rose, a constant show flower, 5 feet, 10s. 6d.

HERO OF SUSSEX (Fowler's)—Light crimson, fine shape, 5 feet, 10s. 6d.

Piltdown Nursery, Maresfield, Uckfield, Sussex.

CHARLES FARNES, SEEDSMAN, 128, St. John's-street, London, respectfully informs his Friends and the Public generally, that he will be enabled to supply orders for the following new and choice VEGETABLE SEEDS :—

ROYAL GREEN MARROW PEA.—This most excellent Variety may be sown as a second early Pea, and will be fit for use about the same time as the Early Warwick: it will be found on trial that no Pea can surpass its flavour or rich colour when boiled. Price 2s. 6d. per quart.

QUEEN OF DWARF PEA.—It is superior to all the dwarf Peas known, and only requires more general cultivation to test its merits, when it will supersede every other variety of the same habit. Price 5s. per quart.

DANCER'S MONASTERY PEA.—This fine large Pea will will be found superior to all the old sorts for a middle crop. It is an excellent bearer, and of good flavour, and merits a place in all gardens. Price 2s. 6d. per quart.

A general CATALOGUE of all the new Vegetables, &c., will be forwarded on application.—Dec. 6.

WM. HEALE, NURSERYMAN and CONTRACT PLANTER, Calne, Wilts, begs to call the attention of the Nobility, Gentry, and Public in general to his extensive subjoined List of FOREST, FRUIT and ORNAMENTAL TREES, FLOWERING SHRUBS, EVERGREENS, &c., all of which are very fine this season, viz.—

200,000 Spruce Firs	from	1 to 2 feet.
200,000 Scotch ditto	,,	1 to 2½ feet.
200,000 Larch ditto	,,	1 to 2 and 3 feet.
150,000 English Oaks	,,	2 to 3 feet.
20,000 Alder	,,	1 to 3 feet.
20,000 Beech	,,	2 to 6 feet.
20,000 Wych or Scotch Elm	,,	2 to 3 feet.
20,000 Birch	,,	1 to 3 feet.
100,000 Ash	,,	2 to 4 feet.
20,000 Common Laurels	,,	2 to 4 feet.
5000 English Elms	,,	6 to 8 and 10 feet.
10,000 Italian or Black Poplar	,,	4 to 6 and 12 feet.
20,000 Fine Evergreen Privet	,,	2 to 4 feet.

Hazel, Hornbeam, and Horse Chestnuts; 1,000,000 of fine Quick or Thorn, two years transplanted: 10,000 Standard, Dwarf, and Trained Apples, including all the new leading sorts; 2000 Standard, Dwarf, and Trained Pears, including all the new leading varieties; a fine collection of Standard and Dwarf Roses; True Fastolff Raspberry, fine, 12s. 6d. per 100; Strawberries, Giant Asparagus, and Seakale Plants.

Also Garden and Agricultural Seeds of genuine quality, Russian Mats, &c.

Catalogues (Priced) can be had upon application.

MR. GEORGE CORNWALL, MARKET GARDENER, Barnet, begs to recommend his New VICTORIA RASPBERRY to the notice of Gentlemen, and likewise Gardeners, as being the finest fruit and best flavoured Raspberry of any grown—it was sold in Covent-garden last season higher than any other: it is likewise a most abundant bearer, and grows 10 feet high. To be had at E. CHARLWOOD'S, Covent-garden; Messrs. W. and J. NOBLE, Fleet-street; of Mr. GEORGE CORNWALL, opposite the Red Lion, Barnet; and all the principal Seedsmen in London, at 3l. per 100, or 9s. per dozen.

WANTED TO PURCHASE, a Quantity of WILLOW TIMBER and WILLOW POLLARDS, sound and fit for Cricket Bats. Parties having a quantity to dispose of, by applying to Messrs. DUKE and Son, at their Cricket Ball, Bat, and Stump Manufactory, Penshurst, Kent, may hear of a purhaser.

FOREIGN SHEET GLASS, of good quality, for Horticultural and general purposes. To be had at F. RUPPRECH'S, 28, Castle-street East, Oxford-street. For Ready Money only.

SEEDS.—CORNER OF HALF-MOON-STREET.

THOMAS GIBBS and CO.

(by Official Appointment) the SEEDSMEN to the "ROYAL AGRICULTURAL SOCIETY OF ENGLAND,"

Beg to remind the Members of the Society, and Agriculturists in general, that their only Counting House and Seed Warehouse is at the Corner of HALF-MOON-STREET, PICCADILLY, LONDON, as for the last Fifty Years.

Priced Lists of Agricultural Seeds are always ready, and may be had on application.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & OTHERS.

BRITISH AND FOREIGN SHEET GLASS for Horticultural purposes, Sky-lights, &c., may be had at JAMES BROMLEY'S, 315, Oxford-street, London, at the Reduced Prices: also Microscopical Glass, French Shades, Plate and Crown Window-glass.

J. B. will be happy to furnish Lists of Prices, or any other particulars that may be required.

FOREIGN SHEET GLASS.

C. JARVIS having just imported a large quantity of the above article, in quality and substance hitherto unequalled, can offer it to purchasers at a lower price than any other house in the trade, at his old established WINDOW GLASS WAREHOUSE, 38, Great Castle-street, a few doors from Regent-street.

CROWN GLASS in Crates or Squares equally low.

SMALL GLASS for HOTHOUSES and GARDEN LIGHTS.

BEE GLASSES, FISH GLOBES, FRENCH SHADES FOR FERNS, &c.

R. COGAN, GLASS, LEAD, and COLOUR WORKS, 48, LEICESTER SQUARE, LONDON.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire Work, &c. &c.

CLARK'S METALLIC

HOTHOUSE WORKS.

55, LIONEL-STREET, BIRMINGHAM.

Proprietor, Mr. THOMAS CLARK.

Superintendent of the Works, Mr. JOHN JONES.

IN returning his grateful thanks to the Nobility, Gentry, and Public at large, for their liberal patronage of the above Establishment during a period of nearly 30 years, Mr. CLARK begs to state that the repeal of the duty on Glass, enables him to offer his METALLIC HOT and GREENHOUSES at a greatly reduced price. These Houses are glazed with British Sheet Glass, in panes of from 24 to 30 inches in length, and of such thickness as to preclude all danger of accidental breakage, whilst that which arises from the action of frost (frequently amounting to 25 per cent. per annum), is effectually prevented by the peculiar mode of glazing adopted. As a sample of his Metallic Hothouses, in which all the most recent improvements are happily combined, Mr. CLARK refers with pride and satisfaction to the magnificent range erected by him in the new Royal Gardens at Frogmore, which is admitted by all competent judges to be the most complete and perfect of its kind in the world.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to the inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their Manufactory.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship: in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus: and B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus will be forwarded, upon application, detailing particulars and prices, at 130 Fleet-street.

THE TANK SYSTEM.

BURBIDGE AND HEALY having heated a considerable number of Pits and other Horticultural Structures, for the cultivation of Pines, Melons, Cucumbers, and other tropical plants, particularly upon the plan recommended in Mr. MILLS'S recent work on the Culture of Pines and Cucumbers, many of which are working at the present time, prove beyond a doubt that every kind of structure may be heated by BURBIDGE and HEALY'S peculiar Tank Apparatus, with the absolute certainty of producing the desired result. Their Apparatus may be seen at work at the following places.—Horticultural Gardens, Chiswick; Royal Botanic Gardens, Kew; Baroness Rothschild's Gardens, Gunnersbury; Mr. Glendinning, Chiswick Nursery; Messrs. Henderson, Pine-apple-place; and in more than one hundred other places.—130, Fleet-street, London.

GYPSUM FOR MANURE, prepared by the only method which will ensure its success for Agricultural purposes, by NEWTON & PECK, WILMINGTON WORKS, HULL. A Pamphlet containing instructions for its application and full particulars as to its uses as a fertilizer, with numerous cases of its surprising effects, sent free to any part of the kingdom, on receipt of a post-paid letter containing Three Postage Stamps.

GUANO (GENUINE PERUVIAN & BOLIVIAN), ON SALE, BY THE ONLY LEGAL IMPORTERS,

ANTHONY GIBBS AND SONS, LONDON;

WM. J. MYERS AND CO., LIVERPOOL;

And by their Agents,

COTSWORTH, POWELL, AND PRYOR, LONDON:

GIBBS, BRIGHT, AND CO., LIVERPOOL and BRISTOL.

47, Lime-street, Dec. 6.

THE URATE OF THE LONDON MANURE COMPANY, FOR TARES, TURNIPS, WHEAT, &c. at Four Guineas per Ton.—The above Manure having stood the test of many years' experience, is recommended with the greatest confidence; being uniform in its manufacture, it may be relied upon at all times, thereby preventing those great disappointments which frequently occur from the difficulty of obtaining Guano and other Manures in a pure state. It will be found most useful for Wheat on all soils, where it is requisite to procure a full plant early in the autumn. Full particulars and testimonials forwarded on application. The Company also supply genuine Peruvian and African Guano, Sulphuric Acid, Gypsum, and every artificial Manure, at the lowest market price, and warranted of the best quality.

40, New Bridge-st., Blackfriars. E. PURSER, Secretary.

LIEBIG'S WHEAT MANURE now ready for delivery.

GYPSUM.—PURE GYPSUM (in fine powder), in 5-ton lots at 25s. per ton in the stream, or 27s. 6d. per ton landed. Also Guano (Peruvian and African), Superphosphate of Lime, Bones, Sulphuric Acid, and all other manures of known value, on Sale. By MARK FOTHERGILL, 40, Upper Thames-street, London.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed: Garden, Ship, and Barge Pumps; also those for Distillers, Brewers, Soap Boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms. by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

POTATO DISEASE.—COTTAM and HALLEN have now ready at their Agricultural and Horticultural Implement Repository, 2, Winsley-street, Oxford-street, London, POTATO PULPING MACHINES for extracting the starch and all other parts of the Potato which remain uninjured by the disease. These Machines are highly approved of by all who have seen and used them, as being the most effectual that can be made for the purpose.

DENTON AND CHARNOCK'S PATENT DRAIN-TILE AND PIPE MACHINE.

A PREMIUM OF £10 was awarded to this Machine at the recent Meeting of the Yorkshire Agricultural Society, at Pontefract, as the Best Machine of the day. Price £20.

Particulars may be obtained, and a Machine seen, on application to Mr. BAILEY DENTON, 9, Gray's-Inn Square, London; or Graveley, near Stevenage, Herts; to Mr. T. H. Charnock, Wakefield; or to the Makers, Messrs. Bradley and Co., Engineers, Wakefield.

DENTON'S "A" LEVEL for workmen in cutting drains may also be had. Price 30s.

BECK'S SEEDLING PELARGONIUMS, 1844.—E. Beck informs the public that his sale of the above will terminate on January 1st, 1846. The small portion remaining are well established in 4½-inch pots. N.B.—E. B. proposes to send out another selection after the Exhibitions of 1846.
Worton Cottage, Isleworth.

POTATOES FROM THE SCILLY ISLANDS.
W. E. RENDLE AND CO. have been fortunate in procuring a few Tons of these POTATOES, *all of which are entirely free from the prevailing disease, and will be found most valuable for seed.* Refer to the Rev. C. A. John's Letter in the *Gardeners' Chronicle* last week, page 801.
*** Price on application.
Plymouth, Dec. 6, 1845.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 6, 1845.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
SATURDAY Dec. 13—Royal Botanic . . . . 4 P.M.
TUESDAY, — 16—Linnean . . . . 8 P.M.

THE importance to this country of GOOD POTATO SEED OR SETS for another year's crop, is such that from a very early period the attention of Government has been directed to it. Enquiries have been addressed to the British Consuls in such places as appeared likely to furnish supplies, and we are now permitted to mention some facts which have been thus elicited.

It appears that although at Bourdeaux the latter crop is diseased, yet the early Potatoes gathered in July were sound, and that some thousand bushels might be obtained.

Corsica can also furnish a few hundred tons; no disease having appeared in that island.

But the great source of supply will be Corunna. Very large numbers are annually grown in Galicia, partly for the Spanish West India Islands. The whole crop in this part of Spain is reported to be perfectly sound, and a very considerable quantity of Potatoes could be readily procured.

Considering the climate of Galicia, we can hardly imagine a province better calculated to renew our English crops; and we have no doubt that we shall soon have Spanish Potatoes in the market. Shippers would be wise if they exposed their purchases to light for some time before sending them on board; and if the Potatoes could be barrelled in dry sand they would command so much higher a price on that account as would far more than defray the additional expense.

AMONG the peculiarities of the mere cultivators of the soil, that which has most generally attracted attention is their unwillingness to believe in any possible improvement of any one thing which they are accustomed to. There is no class of men so easily contented. With them what *is*, is right. They are all optimists, except at market;

"Pascite, ut *ante*, boves, pueri!"

is their maxim.

A peasant exchanges his damp, dirty, smoky hovel unwillingly for one that is dry, clean, and ventilated. A little farmer, accustomed to the flail, abhors the sound of a thrashing-machine; he loves his inky horse-pond better than the waters of Helicon; and would rather be mired in his swampy land, though it grows nothing but rushes, than walk dry-shod over the richest pasture—

"quamvis lapis omnia nudus
"Limosoque palus obducat pascua junco."

A gardener is by no means, of necessity, free from this besetting sin. There are gardeners still who swear by flues and at hot water; who revel in the luxury of a dung-bed, though they might have a tank; are so used to mealy-bug as to think it ornamental, and find no beauty in luxuriant vegetation, but infinitely prefer a few shrivelled leaves at the top of a great many wooden spindles stuck in garden-pots, gathered together under a glass roof, and called "a collection."

It would be unfair and unjust to say that this is a universal character; but it is literally true in many instances, and, partially so, far more extensively than people are willing to admit. Let us take, for example, the discussions that have been going on for some years past as to the cultivation of the PINE-APPLE. It is undeniable that a large number of gardeners are to be found who pertinaciously insist upon their own old methods being infinitely better than those of modern invention; who can find no merit in a general crop of heavy Pines, because somebody or other has now and then grown a single fruit as well, in former days; who sneer at the so-called improvements introduced by Messrs. BARNES, GLENDINNING, HAMILTON, MILLS, or MURRAY; and, when the results are pointed at, either deny them altogether or coolly demand that the proofs shall be sent to them for their own inspection.

To tell such men to grow a Pine without pulling off its roots, would be as profitable as to desire them to boil it. The one kind of advice would be as likely to receive attention as the other. They would rather have a little Pine, by giving it the diet of an Andover pauper, than a large one by feeding it like an alderman.

We are led to these remarks by numberless letters on the subject of the Pines grown at Bicton by Mr. BARNES, and at Thornfield by Mr. HAMILTON. We need not say that each of these gardeners has published an account of his manner of cultivating the Pine; that both are enemies to cutting off roots, or exposing Pines to any kind of check; that they principally differ in subordinate matters of detail (Mr. BARNES preferring to grow his Pines in pots, Mr. HAMILTON in the open soil); and that both are said to have obtained fruit of extraordinary weight and excellence.

Mr. HAMILTON says that he frequently cuts Montserrats, weighing from 6 to 7 lbs.; that, in 1841 and 1842, 20 of this variety were cut, weighing in all 104 lbs., the largest being 7 lb. 4 oz.; and that the majority of his Envilles vary from 7 lbs to 9 lbs.*

Less precise statements are made respecting the weight of Mr. BARNES's Pines, which are alleged to be still finer; but it is currently stated, and, we have no doubt, with accuracy, that most of his Queens weigh between 5 and 6 lbs. and very often much more.

Now, instead of endeavouring to imitate this kind of success, there are persons who depreciate it altogether. What is the use, says one, of a Queen Pine weighing 6 lbs.? two of 3 lbs. each are much better. Why do not these great men exhibit their Pines at the London shows? cries another, forgetting that there may be causes for their not doing so which gardeners are capable enough of understanding. Critics of a third class object to the manner in which such Pine-growers describe their mode of proceeding; carp at their grammar; sneer at their unskilful style of writing, and rate them for having a good opinion of themselves and their ways. For ourselves we have nothing to complain of in this last respect. It is to us a matter of indifference how a man describes his practice, provided it is intelligible; and we have no sympathy with those who, being self-sufficient enough themselves, abuse others for the same fault. They remind us of the drunken fellow who quarrelled with his comrade for tumbling into the gutter like himself.

The fact that the Bicton and Thornfield Pines are of unusual size and excellence is sufficiently shown by the favourable reports made to us respecting them by unprejudiced observers. See pp. 690, 643, &c. To this we add our own testimony. We ourselves some time since received from Mr. PHILIPS, of Thornfield, the employer of Mr. HAMILTON, a Montserrat Pine, sent as *a fair sample* of the produce of his Pine-houses, concerning which we can only say that a more beautifully grown fruit, or one of more excellence, we never saw. We have also received, by the kind permission of Lady ROLLE, a specimen of Mr. BARNES's Queens, of which the following is a description:—

It measured 17¾ inches in circumference, 12 inches in height, and weighed 6 lbs. 6 ounces. The number of pips in height was 15. It was a noble fruit, tapering regularly from the base to the top, which was terminated by a crown extremely small for the size of the fruit. The pips were large and well swelled, possessing in a high degree that rich glossy colour which is a peculiar characteristic of good cultivation. It had lost weight during its transmission to London, and remaining there for a few days unexamined. To its excellent quality some of our Irish friends would willingly testify as we do.

The following letter too from Mr. JAMES NEWTON, a gentleman residing at Cheadle Heath, near Stockport, may be quoted on this occasion in proof of the *quality* of the Thornfield Pines:—

"*Nov.* 28, 1845.—Hearing there are prejudiced persons propagating a report that the Hamiltonian system of Pine-culture has a tendency to injure the flavour of the fruit, I feel it due to this industrious and talented gardener, to state, from my own experience, that the whole of the fruit cut out of the Pine-pit here was of excellent flavour, and as far as an unusually cloudy and wet summer would permit, of good size and colour. The pit was built in August, 1844, and in the following month 50 Pines were planted in it, 45 of which were strong and healthy maiden plants, 35 of these fruited within 12 months, weighing collectively 105 lbs.; five of the plants were old stools, and treated according to the Hamiltonian system; the fruit from these was also cut within 12 months, and weighed 29 lb. 10 oz. avoirdupois, and I have no doubt by pursuing Mr. Hamilton's system of growing the suckers on the old stools there will be a much heavier crop next season."

Having produced this evidence as to there being no exaggeration about the Bicton and Thornfield Pines, we shall, for the future, decline adverting further to that point.

Another subject of animadversion is the plan pursued by Mr. HAMILTON of growing his Pines in the open soil, and not in pots. There are really good gardeners who deny either the possibility or advantage of doing so. We advise them to reconsider the matter. That it is possible, the results at Thornfield sufficiently prove. If they wish for ocular demonstration, let them look at what Mr. INGRAM is doing in her Majesty's garden at Frogmore, where the Pines are grown with as much luxuriance as Cabbages.

That persons fail in the attempt we know: but we also know the cause. The Pine-apple will not root into cold sodden materials; no plant likes to do so; the Pine-apple abhors it. That is all. If the soil is kept open and warm, the whole difficulty vanishes; if that is not attended to, the cultivation of the plant had better be abandoned. It is the opinion of persons well capable of judging correctly, that we shall some day have Queen Pine-apples of 10 lbs. weight. We do not think it improbable. It would not surprise us if such were to be cut at Frogmore some day. There is no reason to the contrary, and much in favour of the expectation.

In short, now that Pine-apples are treated like tropical plants, there is a chance for them. So long as gardeners persevered in docking their roots as they would a horse's tail, the wonder was that the Pines did not refuse to grow at all.

Let it not be supposed that such remarks as these have no application beyond the subject immediately in hand. They have, in fact, a universal bearing upon horticulture, as we must endeavour to show next week.

THE season has now arrived when PLANTING OPERATIONS are carried out. We would, therefore, offer a word of seasonable caution where the object is to produce effect in park scenery. Errors in planting are infinitely worse than errors in building. The one may be altered according to the means or caprice of the owner; not so the noble Oak or the princely Cedar. When they have assumed the size when their magnificent proportions are developed, we too often to our mortification find them blemishes rather than ornaments of the landscape. In building, the rule and plummet guide with precision the hand of him who raises the structure; they are unavailable to him who embellishes our parks and clothes with a masterly hand the naked surfaces committed to his care. No rule or line is available to the artist in matters of that kind. Taste alone, matured by reflection and experience, defines the course of his operations.

It is absurd to suppose, because an individual has attained eminence in some profession or other, that skill in landscape gardening will necessarily be shown by him, as if any one could plant trees, and stake out drives. This operation, one of the most important and difficult connected with the residence of a country gentleman, cannot be so treated with success. It is scarcely possible that the untrained eye should discover the advantages which planting is capable of effecting. And it is because incompetent advisers are consulted in matters requiring a long acquaintance with trees, their habits, and capabilities, that we so often find ground blocked up which ought to remain open, beautiful views intercepted, breadth of greensward destroyed, and all sorts of deformities starting up in the shape of ill-contrived belts and clumps perched on the tops of hills.

A man of taste, conversant with trees and the art of planting them, will never commit such mistakes. He takes advantage of the beauties which Nature has already created, and by a right distribution and appropriation of the subjects under his control, improves those features, but never disfigures them. There are some, indeed, who think that it is only necessary to effect an alteration in their grounds in order to improve them; and in their ill-directed zeal, they overlook the points most susceptible of embellishment, or mar effects which skill could easily produce.

There are so many glaring instances of this in all directions, that we trust to be forgiven for drawing attention just now to the matter, which we do in the hope that, with the coming season, gentlemen will pause before they commit to imprudent hands the task of embellishing their domains, or allow their advisers to disfigure what is beautiful, by violation of the first principles of taste. It should be borne in mind that trees are the grandest objects in Nature—that they constitute the most important features in landscapes—especially in a richly-cultivated country like England. It is, therefore, of the most urgent importance that we should study well their proper disposition from the beginning of all planting operations. It is only by distributing them with skill in the first instance, that favourite trees are saved from the edge of the woodman's axe, and remain as objects of admiration in after times.

Let us, therefore, impress upon those whom these

* See the *new* edition of his excellent "Treatise on the Pine-apple," lately published.

remarks concern, the great importance of a skilful management of their park scenery; and that no trees, be they what they may, will bear to be placed at random, and without reference to what they must eventually become. There are certain principles clearly perceived, but difficult, if not impossible to define, which the artist in these matters knows how to apply advantageously, and which no common observer can be supposed to understand.

PLANT WATERING IN WINTER.

There is nothing connected with plant-culture of more importance than the judicious application of water, more especially during the winter months. The majority of the deaths which occur in cold pits, and other similarly circumstanced structures for wintering plants, result from over-watering. The hygrometer in such a situation would tell how impossible it is for vegetation to exist, at least that kind of vegetable tissue of which the inhabitants of such dormitories are composed. It is rarely that plants in such situations suffer from want of moisture. To house them dry, and to winter them dry, is the passport to their future existence. Water should be gradually withheld from all plants as winter approaches to fit them for hibernation, not only because of the suspension of active growth, but also to harden the tissue, and partially to expel the redundancy of watery fluid with which this tissue largely abounds. Plants, therefore, brought by degrees into a condition of this kind, when all their active functions are for the time suspended, are not so liable to suffer from damp, which pervades all plant structures during winter, at least where artificial heat is never applied, unless to expel frost. The application of water during winter to plants thus situated is rarely required, because the atmosphere immediately surrounding them for some months, in consequence of its coolness, is incapable of absorbing any from the bodies thus placed in contact with it.

Having made these remarks more applicable to plants in pits and frames than to those in larger buildings, I may observe that it is collections of plants which are potted upon the principles I have already laid down that demand and deserve our especial care at this season. Plants which have been liberally treated, both as regards pot-room and a corresponding supply of water during the growing season, require, during the season of repose, a limited and comparatively trifling attendance from the watering-pot to sustain even a large mass of healthy and luxuriant foliage. Plants in temperate houses are not likely to have their juices exhausted by excessive and unnatural transpiration, unless under bad management, or during long and severe winters, when strong fires are required to keep out frost. It is at such a period and under such a visitation only that anything approaching a liberal supply of water should be given in the winter months. It is well, however, to remark that at no period, either in summer or winter, should water be administered unless the plant actually requires it. This observation more particularly applies to plants having heavy shifts, such as Heaths, for example, with small hairy roots, which are incapable of existing for any length of time in what may be termed a mud-pot. The whole of the fibres, which should be pearly white, turn brown and soon perish. The result is, as may be expected, the plant very soon dies, and is, in fact, dead before the discovery is made. I will venture to say that more plants are killed during winter by overwatering than by frost itself; we are always on our guard as respects the latter enemy, but rarely as regards overwatering.

It is difficult sometimes to ascertain when plants in large pots are really in want of water, but then there are certain ways of arriving at this, and if no investigation is made nothing can be discovered. To the sedulous and attentive cultivator, I would say, take no man's word in so nice a matter—a matter on which your success as a cultivator largely depends. Examine the soil with your own fingers, and see whether the pot is wet or dry externally; feel the foliage, and, using your own judgment, act accordingly.—*Duro.*

BERGAMOTTE CADETTE.

Synonymes.—De Cadet, Beauchamp, Beurré Beauchamps, Ognonet (of some).

The names of Bergamotte Cadette and Poire de Cadette occur in the works of La Quintinye, Duhamel, and some other French authors. Their descriptions are, however, exceedingly at variance, and Dr. Adrian Diel justly observes, that the Poire de Cadet of La Quintinye cannot possibly be the same variety as that described by Duhamel, who states that the fruit ripens in October, and is soon over; but according to La Quintinye, its ripening occurs in the months of October, November, and December. Few kinds of Pears continue three months in eating, especially when their becoming fit takes place so early as October. It is, however, a remarkable character in the variety here represented, that it continues ripening in succession, from the same tree, from October till March. Such may not be the case under every circumstance of soil and climate; but it has very frequently been observed to do so. It was received from M. Bosc, of Paris; and as La Quintinye ascribes a greater range as regards its maturity than has been done by authors subsequently, there is every probability that this is the variety to which he referred. It was received under the name of Beauchamps, from M. Piérard, of Manjouy.

Yellowish-brown, partially covered with soft russet.

The flesh is yellowish-white, very melting and juicy, with a rich sweet flavour. The tree is vigorous, and a good bearer. Shoots light olive brown; leaves ovate, tapering, somewhat acuminate, finely serrated; flowers middle-sized; petals oval, with long sepals. In point of flavour this cannot be said to equal the Winter Nelis, and some other first-rate sorts; but it well deserves cultivation, and will be found to afford a supply in intervals between the ripening of other kinds throughout the winter.—*R. T.*

BREEDER TULIPS OF THE MIDLAND COUNTIES.

Having noticed the rectified or broken flowers, I now proceed to give some account of the qualities of the different Breeder Tulips that came under my notice during the month of May last.

Much anxiety has been manifested of late to possess seedling breeders of good quality, and in my opinion with much reason, for being generally much cheaper, the amateur may grow a considerable number of varieties, and at the same time have the chance of breaking them fine, and thus very probably have the whole stock of a superior strain in his own hands. In Tulip growing, the strain, as it is usually termed by florists, is of the very first importance; this the amateur commencing their cultivation must ever bear in mind, for in the course of a long life it may save him hundreds of pounds. Most assuredly, a Polyphemus, Strong's King, Duke of Devonshire, &c., may be broken from the breeder, and sold as such, but as for ever coming in a winning state there are very many chances against it. Since I began Tulip growing, I have changed many of my sorts several times over, having had bad strains palmed on me as being fine. In growing breeders, this is in a great measure obviated, and the grower feels a conscious pride in the bantling of his own, which has more regular features, and evinces a steadier disposition, than the *elèves* of his neighbours.

In describing the breeders it will be well to observe that many are very scarce, though some are plentiful in this locality; still I trust that my brother florists will "jot down" the varieties that they may wish to obtain, that when opportunity serves they may not miss the chance of getting them.

In Bizarre Breeders, Harpham's *Invincible* is a fine and large flower, not yet broken to my knowledge, tall in its growth, cup of fine form, and the base of a fine golden yellow.

Diadem.—The stock of this flower, consisting of about six breeders, one rectified flower and offsets, has been bought for 15*l.*, which in this part of the country is considered a large sum. The breeder is a noble flower, cup like Polyphemus, ground-colour of a splendid bright yellow, with well rounded petals. The rectified flower is a beautiful and striking flame, having a scarlet (like Titian) mingled with the darker colour, which is intense also. A finer flower than Diadem has not been originated in this part of the world lately. As far as properties go the following is equally good, but has not yet been broke: Wood's *George John Robinson* (like its namesake) has every good quality to recommend it, cup about half a globe, thick velvety petals, obtuse, and of a clear chestnut, the base pure, and in all respects first-rate, and amongst its other good points it is one of the first to expand, and one of the last to fade; in Floricultural phraseology, "it stands well."

Duke of Hamilton.—This is a fine and good variety, peculiar for its well-shaped cup and good colour. I believe it was christened by Mr. Slater, of Manchester; it has been broken this year in very fine style, and in either state will prove an acquisition.

Defiance.—This is something in the way of Victory breeder, but with shorter cup; here it has bloomed finely in a feathered state and by most people considered superior to Royal Sovereign.

Lord Stanley (*Wood's*).—Of this variety which has now bloomed two years, all that can be said at present is, that in its breeder state it is very fine, rising well, with a strong elastic stem; it bears most gracefully a clean and nearly perfect cup: of this variety I entertain a high opinion.

Earl of Nottingham, was originated in this neighbourhood, and is one of the purest cupped flowers grown; and either to exhibit as a breeder, or in its rectified state, is certainly first-rate.

Oriflamme.—This is a beautiful bizarre breeder, inclining to scarlet; the cup is superb, and the interior of the most dazzling yellow possible; it stands in a fine form, and attracts attention in a moment. It has been broken, and flames finely up each petal, but without feathering, which is rather against it here. I should imagine, however, it is something in the way of Enterprise, broken, I understand, by Mr. Sandars. It is far superior to Osiris, which, with me, is always slightly stained.

Conquest (Mart's).—This as a breeder is good, being clear and of fine form; it has not yet broken with me; but, from its appearance, I should imagine that it will throw a good flower.

Imperator (Wheatley's).—The variety here alluded to is remarkably clean, and of good form, breaking to a fine feathered flower; it came originally from Derby, but the raiser's name is unknown.

Alderman Herbert (Wood's).—As a breeder this variety has one drawback, the cup being slightly stained; it has, however, every other good property, and the breeder-colour especially being beautiful; I fancy the tinge is so slight, that, should the flower come feathered, it may break out.

In Byblomens we have some fine varieties in the Midland Counties, the broken flowers of which have been previously enumerated. The undermentioned are generally fine, some of them peculiarly so, and deserving extensive cultivation:—

Madonna (Gibben's), is a noble flower, large, well formed, and with a pure cup. It has not yet been broken.

Dr. Hook (Wood's).—Colour a deep purple, with pure white bottom; the stock are still in a breeder state.

Democrat (Dixon's).—This variety is universally admired for its thick petals, good cup, and general qualities. I have not yet seen it rectified, but I understand it breaks well.

Portia.—The raiser's name unknown, good, and fit to stand by any byblomen I know.

Mercutius.—This is a large flower, with good qualities; with me it came perfectly pure cupped this season, though I understand an amateur in Lancashire, who had one of me last year, has bloomed it rather stained; how far certain soil or situations may affect the purity of the Tulip it will be interesting to know.

Cecilia (Wood's).—Of this breeder I can only say that its properties as to shape, purity, colour, &c., are first-rate, and equal I think to Madonna, above alluded to.

Roses are the scarcest class with us, but one of the most pleasing, and, take it altogether, one of the best is *Arlette* (Dixon's), combined to a good cup, and perfect purity, the rose or breeder colour is the most beautiful imaginable. This breaks to a finely feathered flower.

Queen Mab.—Very pretty, very pure, but rather too long.

Miss Blake.—A very pure and delicate pink breeder, the cup good, and petals velvety; very distinct.

Fairy Queen (Slater's).—This sort is too long in the cup, otherwise the bottom is pure and colour good.

Amelia (Abbot's).—This was originated at the village of Stanton, near Nottingham, and sent by me some years ago to Manchester, where it was much admired. It breaks to a fine feather, but unfortunately though the cup is pure the filaments which support the anthers are impure.

Pauline (Harpham's).—This is a very beautiful dark rose, not yet broken, and very scarce. It is inferior to none in cultivation. The very best six breeders of the above-mentioned varieties are Diadem and George John Robinson, bizarres; Madonna and Cecilia, byblomens; and in Roses, Arlette and Pauline.—*W.*

ENTOMOLOGY.

The Potato Flies.—Besides multitudes of the Molobrus fucatus, whose history was recently published, I bred the following species of flies from the same Potato, namely, 2 of Scathopse punctata; 48 of Musca stabularis, 2 of them males; 58 of Anthomyia tuberosa, more than half of them males; 18 of Drosophila cellaris, and

2 of a Borborus; making 128 specimens, independent of many more that had either died in their transformations, or been destroyed by the damp and mites during my absence from home, and also vast numbers of Psychoda nervosa, which flew out of the pot whenever it was opened.

Before describing them, I must state that about the middle of last August, on opening a wicker hamper in which Potatoes were kept for daily use, I found one growing and partially rotten: my curiosity was excited by observing that it was infested with dipterous maggots, which had accumulated in large groups beneath it in the slimy matter, together with their pupæ. The largest maggots were exceedingly like those of the flesh-fly: they were whitish, of an ochreous tint inside, exhibiting whitish lines of the viscera through the transparent skin; the head was pointed, with a black proboscis formed of two horny claws, and at the tail were the spiracles, like two black horny knobs (Fig. 3). The pupæ with them were oval, of a bright chestnut color, the segments slightly marked, the head rounded and wrinkled to a point, the tail exhibiting two black spiracular tubes (Fig. 4.) In the course of the autumn they produced flies called by Fallen Musca stabularis: the male is of an ash colour, clothed with black bristles; the palpi are ferruginous; the antennæ drooping, 5 jointed, and ferruginous, the base pitchy, third joint elliptical and hoary, except at the base, the seta black and plumose, the basal joint minute; eyes large, approximating, naked and castaneous, the margins silvery white, as well as the face, with a black stripe tapering from the antennæ to the three ocelli: thorax hoary, with four black longitudinal stripes before, the two central ones the longest, with a spot on each side beyond the centre; scutellum hoary, with a dark stripe at the base, the apex ferruginous: abdomen ashy-ochreous, shining, variegated with brown patches; wings with the apical cell not angulated but suddenly rounded; squamulæ with the margins pale, fulvous, concealing the ochreous balancers; legs black, apex of thighs and tibiæ ferruginous; pulvelli elongated. Female similar, but the eyes do not approximate, the face has a yellow tinge, and the stripe is broad and elliptical (Fig. 5).

At the same time another larva was equally numerous, but either from its being in a young state, or from its dingy colour, I observed only one; but there were great numbers of the pupæ and dead flies with the others in the pot. These maggots are very singular; they are sluggish but can crawl well, of a dull tawny colour, somewhat depressed, elliptical, tapering to the head, which is moved about, and when protruded is whitish and fleshy, with two minute ebony-like hooks, and there is a little fleshy horn on each side; on the following segment is a spiracle, on either side, surrounded by several stout short rays; the following segments have a double series of tubercles down the back, each producing a bristle, with a double row on each side; at the apex are six diverging bristles, the outer pair very long, they are toothed at the base, as are the others, but in a less degree; on the back of the apical segment are two large spiracular tubercles (Fig. 1). The pupa being the indurated skin of the larva, it varies only in being more convex above, and the fly escapes by the thorax opening laterally.

As this larva does not agree with the figures given of that of Anthomyia canicularis,* although the flies differ but little, I am constrained to assign to it a new name, and, in accordance with its habits, I shall call it Anthomyia tuberosa: Bouché has proposed the genus Homalomyia to comprise the flies with these larvæ. The male is greyish-black and bristly; the eyes are castaneous, naked, approximating on the crown, the inner margin is silvery white; antennæ drooping, 5 jointed, third oblong, fourth a slender elongated basal joint to the longest pubescent seta; thorax with five indistinct broad stripes down the back, second and third abdominal segments with bright ochreous spots on each side, third rarely with two similar minute spots; wings transparent, nervures dark, the two transverse not very remote, balancers tawny white; legs black, base of tibiæ indistinctly ferruginous (Fig. 2. The lines showing the natural sizes of the objects.) Female ashy slate colour; the eyes smaller and remote, the face not silvery; thorax with five distinct broad blackish lines down the back: abdomen ovate-conic, with two indistinct ochreous spots on the second abdominal segment, which are slightly transparent, in other respects this sex is similar to the male.

It will be observed that in A. canicularis the lines on the thorax are narrower and less visible, the basal abdominal segment is not entirely dark, the ochreous spots are larger, the knees are much more evidently ferruginous, and in the female the stripes on the thorax are scarcely defined, and different in their proportions, and the second abdominal segment is often ochreous.

It is a very remarkable fact that larvæ very similar to the above described, and belonging to allied species, have been ejected in large quantities from the human stomach and intestines, but no probable conjecture has been hinted at as to the way in which they may have been introduced into such strange localities. I am now induced to think that they are conveyed there in badly or half-cooked vegetables, either in the egg or larva state, and as they thrive in excrementitious substances, they would be able, under certain morbid conditions of the constitution, to live for many weeks in the human body.

For the other flies alluded to, I must refer to Meigen's Diptera, but Psychoda and Drosophila will be found figured and described in Curtis's British Entomology, folios and plates 745 and 473.—*Ruricola.*

Home Correspondence.

Potato Murrain: Autumn Planting.—I am so persuaded as to the benefits of autumn planting, under existing circumstances, that I intend, if time permit, to plant all my early Potatoes as soon as possible. I am much afraid, however, that many autumn planters, who are trying for the first time, will fall into some errors, as well as labour under some degree of misconception as to the object to be attained, and how to attain it. I find an impression prevailing, that early Kidneys, with other very early kinds, planted in autumn will come earlier into the market than spring planted ones; this, I would suggest, is by no means obliged to be the case. The prime objects, I confess, that I have in view in autumn planting the early kinds are threefold. First, to secure the first sprouts; secondly, to provide against shrivelling, and, by consequence, loss of power; and thirdly, to ensure a strong body of fibres in advance of the haulm or top. Now these are, or ought to be, the principal reasons for autumn planting the early kinds, in addition to which, another of a speculative character, and which holds equally good with regard to the later crops, viz. to call in to our aid the excitability of the vital forces, as antagonistic, in some degree, to total decay. Any plan for producing earlier Potatoes from the open ground than are usually produced by ordinary means, will prove in the end fallacious, unless based on some mode of covering at night, as security against the late spring frosts. Early Potatoes as a safe crop must not be allowed to thrust their heads through the soil until the last week of April by any means: I would, however, prefer an autumn planted crop coming through in the second week of May, with a strong impulse through long accumulated power of root, to one of an earlier date. Another matter is, I consider, of some importance in autumn planting: accumulated wet on close soils may prove more prejudicial than frost, provided it lodges in any degree. Now, in this case, how much, how very much will depend on the relation the Potato set bears to the common ground level, or to the alley between the beds or rows. All I plant at present are done thus: the ground is marked out for double drills (which I consider superior for green crops in general to single drills, when managed accordingly), it is then manured and spread, and next the alleys are pared, if foul, on the manure; it is then dug, and the weeds, of course, are in the bottom, after which I draw two drills with a common hoe, like Pea drills, and insert the sets in the drill, where they are somewhat amongst, but chiefly above the manure; finally, the pair of drills are soiled over from the alleys, nine inches deep, leaving ten inches of a shoulder to each side of the double drills, which are about fifteen to eighteen inches apart. The Potato sets are by this mode about six inches above the level of the alleys, or, in other words, on the common ground level. This may be called a mere garden plan; be it so, the time will come when agriculture and horticulture will agree much better than at present. I am sorry to add that I saw a self set Potato the other day, from an early kind, about three inches high, or, in fact, as early Potatoes are generally in the middle of May, which had the mildew fungus precisely similar to those of September last; the leaf had the same black rings or spots, and decay had already commenced; this augurs badly for those of the spring planting. As to those planted in spring, I am much afraid that precautions will be vain, as I have no doubt the very hedges are full of the sporules of this sad mildew. The Oak, the Blackthorn, and the common Nettle were prematurely destroyed around the Potato fields in this neighbourhood at the period when the mildew was at its height; they also decayed in black patches in the leaf as the Potatoes, but whether the same, or a fungus at all, I cannot say; things looked very suspicious. The Oak and the Nettle were generally affected.—*R. Errington, Oulton Park.* [We trust there is no real cause for alarm on this head. Experiments conducted for the purpose of ascertaining whether the disease will appear in any other crops seem at present to show that there is nothing to apprehend. There can, however, be no doubt that every possible means should be taken to secure a healthy growth next year.]

Storing Potatoes.—Having pitted a quantity of Prince Regent Potatoes about two months ago, of which about one-half was greened by exposure to the atmosphere, and the rest put in without undergoing that process, although dried before pitting, and having opened the pit to-day, it was found that those that were not greened ran about one good out of 20, while those that were greened ran about one bad out of 12; the shoots springing from those which were not greened were likewise formed into small Potatoes, while there was not one specimen of the kind among those which were greened; they appeared to be fine and healthy. I may add that there was no appearance of disease amongst them at the time they were pitted.—*D. S. G.*

Garden Libraries.—It is gratifying in these days, when the mind of most persons seems totally absorbed in objects of speculation, to hear of the laudable example which Messrs. Knight and Perry have set, in the establishment of a library for the use of those employed in their nursery. In an early volume of the "Gardeners' Magazine," its conductor has pointed out the advantages to be derived from the establishment of garden libraries, and that his efforts to benefit gardeners and others in this way were not in vain, abundant evidence is given by the communications from various parts of the country, announcing the formation of several of these libraries, which are to be found in the volume in which Mr. Loudon's suggestions appeared (viz., vol. 2, p. 108), and also in subsequent volumes. It is true, I regret to say, that these are by no means so numerous as they should be, but I trust the time has now arrived when a library will be considered an indispensable requisite in the garden of every country seat, and also in every nursery. It is, indeed, to be hoped that all those nurserymen who have not already a library for the use of those in their employ, and whose means will justify them in so doing, will speedily follow the admirable example which has been set them. It is very pleasing to find Mr. Chambers' saying, at the last annual *soirée* given by the Messrs. Chambers', in Edinburgh, to those employed by them, "in addition to the ordinary payment for labour, my brother and I feel that we do no more than our duty in now tendering our best thanks for the diligence and good conduct displayed by all in our employment during the past 12 months." In like manner, the nurseryman is equally indebted to those by whose labour he is enabled to carry on his concerns; and the forming of a library for their use would be a means of testifying his sympathy for them. To landed proprietors, who have abundance of means, this applies with much greater force. A few days since, I heard, from good authority, that a very benevolent lady, who takes a great interest in the subject of cottage gardens, has established in Yorkshire a small horticultural exhibition, to inspire a taste for such pursuits among the labourers; and at the same place a lending library is connected with the school. Such benevolent actions deserve our highest commendation—nay more, they call on us, very forcibly, to imitate them.—*Ortolano.*

Roses.—The following method of protecting tender Roses has been pursued by me for many years with success. In autumn I gather the branches of the trees, and tie them loosely together, after which I place a cap of Furze branches over the head of the tree in an inverted position, sufficiently thick to throw off the wet, and protect them from frost. The Furze is tied on, either with osiers or tarred string, about two ties to each cap will be sufficient to keep it in its place. I find that furze is preferable to hay, as the latter becomes wet, and in consequence settles so closely to the branches of the trees that the buds are forced into premature growth, and when uncovered in spring are found to have grown some length, and to be completely blanched, which renders it necessary to cut them quite back, and their blooming season is very much retarded in consequence. The furze, whilst affording sufficient protection from frost, admits sufficient air to keep the buds in a healthy state; and if it becomes wet with rain, it will in a short time be quite dry again, and when taken off in spring the buds will be found to be quite healthy and sound, without having been forced into an unnatural growth, as I have found to be the case where I have used hay, and as the furze retains its greenness nearly through the winter, it will not have an unsightly appearance. In this way I have preserved some of the most tender kinds as standards, without experiencing any loss from the effects of winter.—*C. Judd.*

Thornfield Pines.—In your Number for Oct. 11, p. 690, I read under this head as follows:—"Mr. Hamilton says that he only recommends pot culture for this reason: when the plants have made three or four months' growth, they may be made to show fruit at any time, by the simple process of turning the pot, or shaking it now and then till the fruit appears. Thus may plants, or rather suckers, be made to show at any season." Now, "A Subscriber," to Mr. H.'s first edition finds no information on pot turning or pot shaking to cause fruitfulness, which, from its vast importance, should not have been omitted. He begs, therefore, to ask Mr. H. to give a few particulars on the pot shaking and pot turning system; especially, how often it is necessary to perform each operation, to insure success.—*M. G.*

Pine-apples.—I beg to subjoin a few extracts from the columns of the *Chronicle*, by which it appears that gardeners have rather retrograded than advanced in the Pine culture:—Nov. 11, 1843, it is stated that Mr. B.'s Pines averaged 5½ lbs.; and that a Queen Pine, weighing 6 lbs. 4 oz., was exhibited Oct. 17, 1843, by Mr.

Murray, gardener to the Marquis of Bath. In the same Number, W. Dawson, of Bicton, sends a table of the weights of the Pines there, of which the heaviest is 6 lbs. 2 oz. In the Number for Nov. 18, 1843, I find it stated that Mr. Spenser, of Bowood, had Queen Pines weighing respectively 5 lbs. 14 oz., 5 lbs. 13 oz., 5 lbs. 12 oz, and 5 lbs. 10 oz. Dec. 2, 1843, J. Piller of Exeter, eulogises Mr. Glendinning, and says that in 1835 one was cut at Bicton weighing 6 lbs. 3 oz. And, finally, in the Number for Dec. 30, 1843, R. H. Pope affirms that, 35 years ago, he cut 20 Pines, weighing 118 lbs. Some few months back, Mr. B. spoke of 21 of his Pines averaging 106 lbs., and particularises the heaviest as 5 lb. 9 oz. Surely these statements would make it appear that, in Pine growing, there is, to use Mr. B.'s own phrase, "a standing still." That this little retrospect may urge them to move is the sincere wish of—*A Kentish Amateur.* [We have omitted a portion of this letter, partly because it is personal, and partly because the personality is founded upon misinformation.]

Quercus sessiliflora.—I was in hopes that Mr. Malleson would have replied to the remarks (if such they may be called), of "An Old Forester," p. 737, who, if he be a forester, I suspect must have lived in the back woods all his life. A long list of very doubtful authorities is certainly no answer to facts. I write this in order to prevent your readers from falling into the error of "An Old Forester," and to add my testimony of the truth of Mr. Malleson's remarks upon the value of this much neglected tree. Mr. M. has referred to my memoir of the "Botany of Sussex," in which I drew attention to this tree, and in a previous portion of the memoir I drew attention to the fact that the wood of Q. sessiliflora was of as much if not of more value than that of Q. pedunculata. In confirmation of this opinion, I then stated what I now repeat, that the piles of old London Bridge which had stood so many years, were made from Q. sessiliflora, as is also the roof of Westminster Abbey, and all the wood found in old buildings, and commonly stated to be Chestnut wood, of which fact any one may satisfy themselves by comparing the two. Q. sessiliflora is a finer and taller tree than Q pedunculata. If your correspondent be a fair sample of foresters, we need not wonder long how it is that Q. sessiliflora is so rarely met with. So far from misleading your readers they certainly are indebted to Mr. Malleson for drawing their attention to the value of this tree. This may probably be read by some who possess woods, and it may be of even further service, by drawing their attention to whom they intrust their timber and its growth—a question of much interest pecuniarily to themselves and of importance to the nation at large, but a question which I am sorry to say has hitherto been almost entirely overlooked by the owners of estates in England.—*T. H. Cooper, Camden Town, London.*

To Keep Hares and Rabbits from Barking Trees.—Mix soot and milk until it acquires the consistency of thick paint, and apply it with a paint-brush, choosing a dry day if possible for the operation; once a-year is sufficient. The garden and orchard here are surrounded with wood. Before I tried this remedy I was very much annoyed with them. I have used it with the greatest success for two years.—*Geo. Wells, Scotney Castle.*

Vines in Dwelling-houses.—A singular instance of the growth of a Vine may be seen at the Angel Inn, Halesworth, Suffolk; a large portion is trained in the front of the house and stables, but a branch 23 feet in length is conveyed through the windows of a sitting-room, crossing the ceiling to the centre of the house, where it is trained to a lofty skylight, producing fruit in abundance. Might not some one of our mechanics and others enjoy this delicious fruit, by introducing the Vine in their workshops, in a similar manner?—*N. S. Hodson, Bury St. Edmunds.* [Certainly they might.]

Ornithology.—The remarks under this head at p. 785 evidently refer to the Motacilla boarula, or Grey Wagtail, of whose peculiarities an interesting account was given at p. 737, 1843, and at p. 557, 1844. In two instances I have seen this little bird perform the same sort of freaks as have been detailed by your correspondents, but in neither could I discover anything that would satisfactorily account for its singular movements. It has been suggested by a writer in the "Zoologist," that the poor bird is probably a disconsolate widower, and seeing himself in the glass, "mistakes his own mould of form for the person of his lost mate;" but however plausible may be the idea, it was not supported by the facts which came under my notice; I was inclined to think the other suggestion, quoted by your correspondent, of the bird fancying it saw insects, was more likely to be near the truth. But here, again, the supposition was contradicted in some measure by the circumstance of the bird continuing to fly and tap at the same window for several weeks, without its perceiving the resemblance of insects in any other than the one it first took possession of. I suspect we have yet to learn the cause which apparently renders our "feathered angel" so unhappy. However annoying its tapping may be to some, I shall welcome my visitor, and watch his motions a little more narrowly the next time I am favoured with his company.—*W. B. Booth.*——During the winter of last year a friend of mine had his windows attacked by a blackbird just in the way described by "C. W. H." The window was occasionally opened to see if the creature wished to gain admittance, but it was soon discovered this was not his object, for he returned and commenced dashing against some other portion of the window which was closed. The situation of the house is in a valley adjoining, or rather is on a part of Salisbury plain; it is surrounded with trees and shrubs. In addition to the above I may mention that a water wagtail was observed time after time to dash against a window in pursuit of flies which were inside. The individual who occupied the house watched, for the purpose of discovering the object of the bird, and he is quite satisfied that food was the impelling motive. The bird was caught by the "good man of the house," who was going from home, and who took the bird with him a distance of six miles, when the creature was set at liberty. The individual returned home in the evening, when his housekeeper inquired at what time the bird was set free; upon being informed, she mentioned, to her master's astonishment, that the bird was at his old tricks within half an hour of the time of liberation. He rather questioned whether it was the same bird, but she assured him she had no doubt, as its feathers were much ruffled, which was the case, the bird having been carried to the end of its journey in a small bag.—*J. J. F., Devizes, Wilts.*——The window of a sitting-room having been occasionally visited by a bird for some years as described above, the last time being on Nov. 30th, I beg to give the following solution of the mystery. The bird is a species of fly-catcher, and the objects of its pursuit are the flies, which, drawn out by the heat of the room, crawl on the inside of the window-panes, and which during the winter months it would not find in sufficient quantities for its sustenance in the open air. This will account for its avoiding a blank or an open window. The window of my room against which it always flies, has a parapet before it along which it runs, then stops for a minute, and darts at the glass; and I have remarked it to look up as if examining the window, and then fly away, without springing against it as usual, which is I think an argument against the idea that it is attracted by the reflection of its own figure in the glass—*H. H. H.*——"The mirrors present a glittering dazzling appearance in the rays of the sun; the poor birds are attracted thither, as it were, by some irresistible impulse, and are enclosed in the nets, or shot down by hundreds. It is on the same principle that birds are attracted by the strong light exhibited by the lighthouses of our coasts: they sometimes fly with such violence against the plate-glass windows as to fall down dead, or stunned." See a little book on the Lark, as an example of cheerfulness, printed for the Society for Promoting Christian Knowledge.—*G. A. C.*

Apple Refuse as Manure.—Will some of your readers in Herefordshire or Devonshire inform me of a useful mode of applying the Apple chogs? I mean the refuse of the Apples after extraction of the juice. Chemical knowledge might perhaps suggest some useful hints as to the treatment and application of this substance. Reduced to ashes, might it not with advantage be applied to Apple orchards and other land? In the former case, it would, perhaps, restore to the soil some of the productive qualities exhausted by the trees. Mr. James F. W. Johnston, in his "Elements of Agricultural Chemistry and Geology," has a section upon ashes, in which he treats of kelp, wood-ash, straw-ashes, &c.; and in another part, p. 49, he gives a table, from which I take the following estimate of 1000 lbs., of the ash of the fruit of the Apple tree (Pyrus spectabilis—Chinese Crab).

Carbonates of potash and soda	190
Phosphate of do.	141
Carbonate of lime	370
Carbonate of magnesia	55
Phosphates of lime and magnesia	186
Silica	37
	979

Fraudulent Seedsmen.—A fruiterer was once observed placing the finest and largest fruit on the top of a basket for sale. "Is not that dishonest?" said an observer. "Will not the purchaser think the whole basket equal in quality to the top, and is not that a deception?" "Not at all;" said the fruiterer, "everybody knows we do so." Does any man in passing a house, and reading, "This very desirable family residence, &c. to let," believe that it is really very desirable? I doubt it. And I should have doubted also that any one in this day of floricultural advantages would have purchased seeds, flowers, or fruit, simply from an advertiser asserting they were choice, or beautiful, or matchless, or splendid, &c. Are we not neglecting the opportunities afforded us by the great horticultural exhibitions? If any florist's flower is really fine, it will find its way there, and then ought our notes to be made by which our purchases should be guided; and from our own plants so selected should be saved the seed from which we may justly hope to raise improved varieties. It may be taken as a rule that no successful raiser of seedling florist flowers will part with any seed he would sow himself. It would be as reasonable to expect an inventor to give you his secret before he had secured it by patent. Then how is it that the seeds are sold? Simply thus: the seedsmen have a demand, and they obtain the best they can, and they must take the description of its parentage as it is given them. It is advertised as saved from the choicest varieties, and the falsity justified on the fruiterer's plea, that nobody believes it; persons purchase like Mr. Malcolm, and are disgusted, and buy no more; but there is always a fresh succession to see "the horse's head where his tail should be": only they are not equally generous to tell that they have been taken in, and so keep others outside the stable door.—*Veritas.*

Societies.

HORTICULTURAL SOCIETY.

Dec. 2.—R. W. Barchard, Esq., in the chair. Considering the season, a large number of beautiful objects were brought together. A Knightian Medal was awarded to Mr. Plumbly, gr. to C. J. Dimsdale, Esq., for four magnificent specimens of Cape Heath; especially one of hiemalis, measuring about 5 feet across, and 4 feet in height.—From Mr. Moore, gr. to the Earl of Auckland, were two plants of Dysophylla stellata, for which a Banksian Medal was awarded. This pretty little Indian annual looks something like a Bed-straw; but is more erect, and bears numerous spikes of pretty violet blossoms, which, in their arrangement, somewhat resemble those of a Mint; being, in its native country, an inhabitant of warm swamps, to grow it well it requires plenty of heat and moisture.—Mr Robertson, gr. to Mrs. Lawrence, sent the charming Saccolabium denticulatum, with numerous clusters of small flowers, which appear as if covered with frozen dew-drops; Epidendrum viscosum, a species from the central part of America; and the scarlet-flowered Pitcairnia splendens, the gayest of the genus. Along with these were Cypripedium venustum; Catasetum Naso, a species imported in 1842 by Linden; Portlandia grandiflora, a fine old stove-plant, with large snow-white Convolvulus-like flowers; the beautiful little Guatemala Lælia acuminata; and cut specimens of Epidendrum nutans, and of the Indian Ipomœa cymosa, which ornaments our stoves at this season, with small white yellow-eyed flowers. A Banksian Medal was awarded for the first three plants. Several cut specimens of Orchids were produced from the gardens of the Duke of Devonshire, at Chatsworth. These consisted of the orange-flowered Cymbidium giganteum, a species of recent introduction; Trichosma suavis, an East Indian plant, introduced by Mr. Gibson, which, on account of its sweet perfume, is highly esteemed by the native women, who adorn their hair with its blossoms; Maxillaria cucullata; and the very curious Bolbophyllum Gibsoni, with dark purple flowers, arranged in a dense knot, having something of the appearance of a good-sized Raspberry. The plant was also found by Mr. Gibson, on trees near the summits of the Sylhet Hills, where the climate is temperate.—Of Chrysanthemums, beautiful collections were present, from Messrs. Chandler and Son, of Vauxhall, and from Mr. Wright, of Hackney. Mr. Higgs, gr. to J. H. Barchard, Esq., sent a plant of Primula sinensis, which, instead of flowers, had produced tufts of leaves, beautifully exhibiting the transformation of the one organ into the other, and confirming the doctrine that the different parts of which a flower is composed are not essentially different, and that at certain stages of growth they will become either the one or the other, according to the circumstances under which they may be placed. This transformation in the Chinese Primula is not uncommon, especially at this season.—Of Fruit, the greatest novelty was produced by Mr. Lane, gr. to H. Palmer, Esq., of Fulham, in the shape of ripe fruit of Benthamia fragifera. This is not fit to eat, but is a rarity, and handsome in appearance. It has been reported that this Indian tree was quite hardy; but experience has not confirmed the statement; for although it will grow out of doors, yet it requires the aid of a greenhouse to grow it to anything like perfection. The plant from which the specimens sent were taken, was stated to be growing in a pot in a conservatory, and to be about 12 feet in height.—Of Pine-apples three specimens, weighing respectively 2 lbs. 9 oz., 2 lbs. 10 oz., and 3 lbs., came from Mr. Busby, gr. to S. Crawley, Esq.; and fine bunches of Black Hamburgh Grapes were sent by G. Crawshay, Esq., of Colney Hatch. These were produced without the aid of fire-heat till about the beginning of November, when slight fires are made, not for the purpose of raising the temperature, but to keep out frost and to dry up the damp. The principal feature in Mr. Crawshay's system of Grape-growing is, that he allows the Vines to have plenty of air, the Vinery being well contrived for that purpose. They were well swelled and finely-coloured, and considering the season were remarkable specimens.—From Mr. Robson, gr to W. Gambier, Esq., was a dish of Late Admirable Peaches.—From the Garden of the Society were plants of Cypripedium venustum and insigne, a large specimen of Zygopetalum intermedium, Achimenes picta, a Cape Heath; the showy Pimelea spectabilis, the useful Begonia semperflorens, Boldoa fragrans with clusters of greenish blossoms, and a collection of Chrysanthemums. The fruit consisted of Apples and Pears; among the former were the Golden Reinette, an old variety, but still one of the best for dessert; Claygate Pearmain, preferred by some to the Ribston Pippin; Sam Young, an Irish variety, not large, but good and an abundant bearer; Mère de Ménage, and Dumelow's Seedling, both kitchen Apples; the latter one of the very best in cultivation. The Pears consisted of Ne Plus Meuris, Glout Morceau, Winter Nelis, Bergamotte Cadette, and Beurré d'Aremberg, both from a wall and from a standard. Those from the latter were not a quarter so large as the fruit from the wall but were much better flavoured, and assumed quite a different appearance, being quite covered over with russet.

LINNEAN SOCIETY.

Dec. 2.—Edward Forster, Esq., in the chair. Mr. Edwin Charles Charlton was elected a fellow. A paper was read on the structure and anatomy of the Eriocauloneæ,

by the late William Griffith, Esq. The axis of these plants is a rhizome, from which leaves and flower-stalks arise. In most cases they are submerged plants, in Eriocaulon setaceum the leaves are emerged. The leaves are hollow, white below and green above. They are covered with an epidermis on the inner side of which is a layer of cells, the under layer containing granules of a green colour. The interior is hollow, but the cavity is divided by vertical septa, which are composed of cellular tissue. In the midst of the cells a great number of raphides are frequently observed. Raphides are seen in the same position in Pontederæ. On the under side of the leaves the epidermis was supplied with stomata. The author pointed out the existence of an epidermis and stomata on these plants as forming an exception to the general law of the absence of these organs in submerged plants. He pointed out also the relation between these plants and the Xyrideæ, and Lobeliaceæ. The paper was illustrated by several drawings. At the conclusion of the paper the Chairman stated his regret that they could no longer return their thanks to the lamented author of this paper, but as all Mr. Griffith's communications passed through Mr. R. H. Solly's hands, he proposed a vote of thanks to Mr. Solly.

Reviews.

The Gooseberry Growers' Register, or an account of the different Gooseberry Shows held in Lancashire and Cheshire, and other parts of the Kingdom, for the year 1845; to which is added a statement, exhibiting at one view, the number of Prizes won by each sort of Berry at the different Meetings. Manchester: T. Whittaker, Blackley, and J. Wolstencroft.

This contains accounts of 171 Gooseberry Shows, held in the last season. The following are some of the principal varieties of prize Gooseberries:—

Red.	dwts.	grs.	*Yellow.*	dwts.	grs.
London	36	16	Leader	26	17
Wonderful	33	0	Catherina	30	4
Companion	28	0	Two to One	28	0
Conquering Hero ..	30	18	Pilot	25	16
Lion	25	12	Gunner	23	21
Lion's Provider ..	28	0	Dublin	26	16
Green.			*White.*		
Thumper	27	16	Freedom	27	8
Overall	25	7	Queen of Trumps ..	24	0
Turnout	23	6	Eagle	23	14
Weathercock ..	24	6	Cossack	25	16
Peacock	26	15	Tally-ho	25	14
Queen Victoria ..	26	0	Miss Walton ..	24	19

It will be seen from the above that the London is the heaviest by upwards of 3 dwts.; and Mr. Whittaker informs us it is the heaviest berry ever grown. It is astonishing that at all these shows the awards are made solely with reference to weight; and that no encouragement is held out for raising seedlings of superior flavour. The work exhibits careless printing, even in the title page. Those, however, who have a fancy for growing large Gooseberries will find it useful.

New Plants.

Anemone japonica. Japanese Anemone. (*Half-hardy Perennial.*) Ranunculaceæ. Polyandria Polygynia.—How any one, calling himself a botanist, could have fancied this plant to be an Atragene passes our skill to explain. Yet such has been the case, for it stands as an Atragene in the writings of Thunberg, a Swedish botanist, who once possessed some reputation. De Candolle might well hint that it was probably an Anemone, as indeed was tolerably apparent from the description of it. It is not only an Anemone, but a most beautiful one, not inferior to the Chinese Chrysanthemum, or even the Anemone coronaria of the East. For its introduction to this country the public is indebted to the Horticultural Society, who received it from Mr. Fortune, in 1844. That indefatigable collector had met with it at Shanghae, the Japanese port of China. It has flowered this autumn in great beauty in the garden of the Society, in a greenhouse, its flowering stems being nearly 2 feet high. It may, however, be expected to be better suited to the open border, at least during summer, and it is probable that it will not suffer even from the cold of winter. According to Siebold it inhabits damp woods, on the edges of rivulets, on the mountain called Kifune, near the city of Miako, in Japan. The same author tells us that it is much cultivated by the Japanese, for the sake of its beautiful purple blossoms. Many find it to prefer a moist loamy soil. It is usually propagated in Japan by offsets, for its seeds rarely ripen. M. Siebold adds, that it grows at considerable elevations on the mountains of the centre of Japan, whence he infers that it will bear even a continental winter.—*Botanical Register.*

Garden Memoranda.

Mr. E. Beck's, Worton Cottage, Isleworth.—Those who are growers of Pelargoniums and Roses would do well to visit this place, for the purpose of observing the mode of winter treatment of these beautiful tribes of plants. The glass erections consist of a range of tank-houses, 150 feet in length; one-third being heated with Stephenson's iron tanks, one-third with tanks constructed with wood, and the remainder with a tank formed of slate. These "lean to" a south wall. There are also two span-roofed houses, 45 feet and 30 feet respectively, and a lean-to house for specimen plants, 26 feet in length. In addition to these, there is a long range of cold frames, and a plunging-bed, over which a frame is erected adapted for shelter in winter and shade in summer. The greenhouses are filled with specimen Pelargoniums, and seedlings of the present year, the former in that state of rest described in No. 37, and the latter in beautiful condition, both as regards growth and colour. The arrangement of the whole, and the neatness and cleanliness observed in every part, reflects credit upon Mr. Dobson, the gardener. In passing, we noticed a novel and excellent mode of packing plants for sending out, and which, we learn, has ensured their transmission, in the finest condition, to the most distant parts. Four small willow twigs are stuck round the pot and tied at the top, the leaves that protrude beyond are carefully passed within, and bass tied round to keep them in their places, the whole is then enveloped in a sheet of thin paper, and dropped into the willow basket, which is then secured at the top, the following diagram will explain the mode of proceeding.

The Roses are thus disposed:—In the cold frames are placed the tender varieties; at the back and front of each box one board is hung upon hinges, by which a free current of air is admitted when it is desirable to keep on the lights. All the bottoms are slate on which the plants stand, affording perfect drainage, and preserving the wood work of the frame from decay. The hardier varieties are all placed in trenches, the sides of which are supported by slate, which in such a situation is imperishable. At the bottom of the trench two bricks are placed on edge, on these the pots are ranged, and then the trench is filled with old tan or sawdust, and well trodden in. It will at once be seen that the drainage is preserved perfect, and that though worms may get out they cannot get in. The roots also that may work out of the hole of the pot find nothing to strike into, a point of considerable importance. In a future number we hope to give some account of the cultivation of Perpetual Roses, which, under the management of Mr. Dobson, have realised everything their name would lead us to expect.—*

G. W. Norman, Esq., Bromley Common, Kent.—Those who have heard of this place, or have seen the famous specimens of plant cultivation with which Mr. W. Barnes, the gardener here, has been in the habit of decorating the tables of the principal metropolitan exhibitions for some years past, will, of course expect to hear of spacious hothouses, and every other facility necessary for first class gardening. So far, however, from the accommodation being either good or extensive, the plant houses are few and contracted in size. Mr. Barnes has, however, contended successfully against these difficulties. The glass structures consist of a plant stove twenty feet long and about twelve feet wide; an Orchid house of the same length and eight feet wide, a lean-to, little larger than an ordinary Melon-frame. These are heated by hot water and flues conjointly. A greenhouse, twenty feet long and eighteen wide, rather lofty, with a hipped stage, heated by a flue. A Vinery of the same width as the greenhouse, but a few feet longer, containing a Muscat of Alexandria Vine, from which fine crops have been annually cut for upwards of a hundred years! These houses are situated in a kind of sunk garden, near to which, on the higher ground, and parallel with the front of the houses, are some Cedars of Lebanon, and evergreen Oaks of the same age as the Vine, which throw a partial but perpetual shade upon them throughout the winter months, while the back wall of the Vinery being only a few feet in front of the stove, also throws considerable shade over it. The Vinery, during the winter, having a temporary stage put in it, forms a suitable hybernatory for Azaleas and Cacti, which are huddled closely together, and being put to work about March, it comes in handy for forwarding any plants that require the assistance of heat, and for growing a few of the larger stove plants, until such time as the Grapes begin to ripen. This house is heated by hot water and a common flue. What to do with these plants at the time the house is obliged to be cleared, is a difficult question, especially as the plants in all the other houses require more room at that season, and hence a general re-arrangement has to be made. The more hardy of the Azaleas, Heaths, and common greenhouse plants, are consigned to a temporary wooden pit, the sides of which are stuffed with hay and its top covered by some Whitneyed calico, while the Cactuses are stowed in an outhouse, covered up in case of need with straw. Last spring, in consequence of the severity of the weather, the Azaleas in this pit were repeatedly frozen, and though the plants were not injured, the bloom was so much checked that most of it came deformed. This pit through the summer is used for sheltering the principal greenhouse plants during the time they are in bloom, the subdued light of the calico being found favourable to the preservation of the flowers, and the sashes being tilted in favourable weather several feet high, visitors can readily examine the contents of the frame. This frame is, however, not the only place for preserving plants for exhibition after they are in bloom; the dusty stoke-hole, or a disused Mushroom shed, is often used for that purpose, for the want of better accommodation. The preservation of plants after they are in bloom, and the getting of them in as the term is, "to the day," is a very difficult task, and requires an amount of watchfulness which those only who have had experience in such matters can fully understand. In addition to the houses before mentioned, there is a Heathery, 25 feet by 14, heated by a flue; two ranges of pits, each 10 lights long, heated by hot water; and several one, two, and three-light boxes of various sizes, used for forcing Cucumbers, &c. Several of these frames have lately been fitted up in a range for plants; they have been raised on posts sufficiently high to give head room for a tolerably good specimen, and the sides are neatly packed with thin turf, cut in the same manner as that for laying lawn, and under each light both at the front and back several large draining pipes are introduced so as to insure a free circulation of air among the plants at all times. This turf was cut dry, and being packed about 18 inches wide, will resist a considerable amount of cold, and the outside being well aired will be removed an inch or two at a time for potting plants. The two ranges of pits are, however, the principal plant manufactories, and in them may generally be seen a great variety of superb specimens. To describe the plants, however, would be only to repeat a thrice-told tale. All, therefore, that we shall say is that, taken as a whole, they are as promising as could be desired. We may mention that the Orchids were in August last turned out of their pots, and divested entirely of the old mould, and, after being thoroughly cleaned, were repotted in a preparation consisting principally of large pieces of charcoal, with a slight admixture of very turfy peat in square pieces. They had grown most admirably since, and are now in the finest health imaginable; and so convinced is Mr. Barnes of the advantages of using charcoal, which is always pure, clean, and wholesome, that in future he thinks of potting his Orchids in that material entirely.—*Judex.*

Miscellaneous.

Bolivian Cacti.—It was within 13 leagues of this place (Cochabamba) that I had the pleasure of finding in February the beautiful Pilocereus. It is generally found on the slopes of bold, rugged mountains, whose aspect is towards the north, where it enjoys plenty of sun and a dry sandy soil. Frequently 20 or 30 stems proceed from the same root, the outer ones partly lying on the ground forming a curve upwards, the inner stems grow erect and are those which are most hairy; they seldom reach the height of 4 feet, and from the older stems in the centre spring the flowers, which are of a beautiful dark red, about the size of C flagelliformis; the seed-vessels are round or rather oval, smooth and shining on the surface, hollow within and destitute of a pulpy substance; the seeds are round and of a blackish colour. The place where I found it most abundantly, was near the vicinity of the city of Potosi at an elevation of 12,000 feet; therefore you may judge from this it is frequently exposed to frost. In the language of the Quichuan Indians, it is called Quchuallo, pronounced Ke-wal-yo. The other enormous species of Cereus, which I mentioned, grows in the same localities and often attains the height of 20 feet. The flowers proceed from the top, and are of a dark red colour arranged in a circle; when viewed from a distance, one might imagine that a flower of a Pæonia had been artificially placed on the plant. The stems are often 18 inches in diameter; the natives use the dried stems for rafters to their houses, also for doors, being the only timber the country produces in those parts. I possess, in Valparaiso, a piece of this wood, which on my return I will forward, for the purpose of giving you an idea of its size and structure.—*T. Bridges, in the London Journal of Botany.*

Bees.

Bees' Ballast.—The curious manner in which bees collect farina has given rise to a fabulous story, which seems to rest on the authority of Aristotle and Pliny, namely, that "bees in high winds carry a small pebble for ballast." In these enlightened days of science one could hardly think this could have any weight. Dr. Badham asks, however, in his "Insect Life," "has the bee become aware that the wind will have less power over him if he steadies himself by a weight?" He followed Della Racca on this subject; but those who have studied bees amongst the flowers and at the apiary, know that the little pollen balls which they collect on their hinder legs are for a different purpose than ballast. Some think that the ancients alluded to the mason bee, but that insect carries the materials for its nest in its mouth, while the honey bee carries no visible wax into the hive. Della Racca, however, says that "the labouring bee (honey bee) carries nothing about him but wax," and adds, "he carries his ballast in his arms." Dr. B. seems to credit this, for he considers that this writer "knew more about bees than anybody, except Huber," and quotes him in preference to the author of "Insect Miscellanies," whose views on this subject accord with my own.—*W.*

Answers.—*W.*—Apiarians tell us that "so long as there is any chance of a hive throwing off a swarm, the working bees prevent the old queen from destroying the young brood queens." But when swarming is given ud from any cause, then there being no object in saving the brood queens, the old queen is allowed to destroy them before they come forth from their cells. Mr.

Nutt, in his book, mentions that, on the morning after he returned the old queen he found, to his satisfaction, two royal nymphs laid dead on the alighting board. I do not understand your statement that the old stock would be exactly in the same position without their old queen as with her. For though there is every prospect of a new queen coming forth in six or eight days, yet I believe the actual presence of their old fertile queen would make a material difference in their working in the interim. This might easily be known by experiments. Swarming is so natural to bees that it is impossible to prevent it with any certainty: but by shading them and giving room I believe there is an even chance of preventing it. This year my bees swarmed at nine o'clock one hot morning in July, owing to the hot sun coming upon the boxes before the shade was drawn over them, which was usually done at 10. If my bees happen to swarm next year I shall treat them in the same way, and I hope with the same success. As a proof of the necessity of shading wooden hives, I may mention that for two years my Nutt's hive was exposed to the full force of the sun, during which time the bees swarmed regularly, and I got no honey. Last year, by shading them, I prevented their swarming, and got 16 lbs. of honey; this year I got 15 lbs.—*S.*——*Help.*—The bad flavour of your honey might be occasioned by the bees frequenting flowers such as the Onion tribe, but being dark its bad flavour was more probably caused by honey-dews than by Heath. Milton certainly mentions that "the honey obtained from the vicinity of extensive heaths (such as Bagshot-heath, &c.), is mostly strong flavoured." But he also says, "We receive honey of the finest quality from Northumberland, and the Highlands of Scotland." Huber states that smoke has a material influence on the instinct of bees; but I think he does not mean smoke from the large puff-ball, which has a harmless effect on bees. Cotton jocosely observes that "they will get well in 20 minutes, have head-ache next morning, and are all the merrier afterwards." He is in error, however, in saying that "bees load themselves with farina to enlarge their combs." Need it be repeated that they only store up that substance in their combs as food for the larva?—*W.*

CALENDAR OF OPERATIONS
For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

Orchidaceous-house.—A drier atmosphere and a lower temperature are now desirable here. No kind of plants is more benefited by rest than Orchids; this is natural to them in the tropics; but, then, our collections are from countries with different seasons of growth, and various kinds of temperature and climate, and hence it is extremely difficult to cultivate in one house a miscellaneous collection of them so satisfactorily as when there are two divisions, the one commanding a higher temperature, with more moisture, than the other. Where such do not exist, advantage must be taken of other houses, such, for example, as a forcing-pit; many of them, in a growing state, can be removed here to great advantage, and thus their growth may be promoted without injury to the general collection. *Conservatory.*—This building will now begin more especially to demand our assiduous care; plants, to promote its brilliancy, will now be contributed from the forcing-pit. These should be arranged with care, so as to produce the best possible effect. All decaying flowers should be removed every day; in fact, the utmost cleanliness should pervade every corner. Never allow the fine foliage of Oranges and Camellias to become dirty, for the beauty of the conservatory depends quite as much on them as on mere floral decoration.—*A.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Look carefully over rock plants, and protect the roots of such as are tender. Divide and transplant any that are spreading too much. In favourable weather, when the walks are dry, manure may be wheeled on borders, to be dug in during winter as opportunity offers. Land that is naturally very stiff should receive a coat of sand or lime rubbish, to lighten it; but by no means disturb the soil unless it is dry and in a fit state for digging. Cabbage and Provins Roses might now be pruned if the weather continues mild; but Chinese and other tender kinds should be left till winter is over. Roll walks, lawns, &c., and keep every part neatly swept. *Pits and Frames.*—If the soil in the pots has become green on the surface, it should be carefully removed with the point of a small stick; this must be done in mild weather. Scarcely any water will be required at this season; if the plants flag a little should, however, be given in fine weather. Remove damp leaves, and give air copiously every fine day.—*B.*

III.—FLORISTS' FLOWERS.

Polyanthuses are this season giving an abundance of autumnal blooms. The varieties which appear to do this most profusely are Hufton's Lord Rancliffe, a very beautifully marked variety; Hufton's Earl Grey, a fine show flower; and Brown's Free Bloomer, a new and excellent sort, and which is most appropriately named. It is not advisable to let them bloom thus prematurely, as it is calculated to weaken the trusses next spring; they should therefore be removed. *Auriculas*, as well as the above flowers, when grown in pots, should be carefully examined, and the least indication of obstruction in the drainage of the soil must be promptly attended to; if neglected during the winter months, very great danger of losing the plants will be the result. *Tulips.*—Where the beds are hooped or ironed over it will be advisable to cover with mats during excessively wet weather. *Carnations and Picotees.*—All rooted layers are of course off the plants; it sometimes happens that some varieties, such as Hepworth's Leader, emit roots more slowly than others; in this case it will be advisable to let them remain on till spring; in the first place, cleaning the surface of the pot, removing any decayed leaves, top-dressing with a little leaf soil, and then pegging down the layers afresh, with good management, and under favourable circumstances, they will make good roots by the time of planting out in spring.—*C.*

IV.—PINERIES, VINERIES, &c.

Pines.—The amount of atmospheric humidity which swelling Pines will enjoy is surprising, even at this period of the year, provided the atmospheric management is of a natural character; that is to say, heat and a free circulation of air, in proportion to the intensity of light; and comparative low temperature with abundance of atmospheric moisture through the night. My late fruiters have received this treatment; the leaves are heavy with dew every night, and when sunshine occurs, I give no air until the thermometer reaches 85°. Nothing can succeed better. Insure 50° by night and 60° by day, if possible, to your young stock in dung pits, with a very free circulation of air both night and day, if possible. Proceed slowly with early Vineries and Peach-houses. Secure plenty of atmospheric moisture in proportion to the heat, in both these structures. Take care to either impart a slight degree of bottom-heat, or at least to retain the warmth already existing, in the outside borders where forcing has commenced or is about to be commenced. Prepare Fig and Cherry houses for early forcing; the same routine as recommended for the Vines and Peaches is equally eligible here. If your Seakale "draws" in the Mushroom-house, immediately starve the bottom-heat by the application of cold water. I use strong manure water, with a good handful of salt blended, with the most beneficial effects.—*D.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Various enquiries having been made respecting the pruning of Pear trees, and as this is the best season, a few remarks on the subject may prove useful. With regard to very young trees, the object of pruning should be to encourage the growth of wood in proper directions, rather than the production of a few fruits at the expense of retarding that development of the tree. The form in which the tree is to be trained must be first decided upon. For walls and espaliers the horizontal disposition of the branches is the best; therefore, if the tree be a maiden plant, it must be headed back to the three buds best situated for producing a horizontal branch on each side, whilst the third or uppermost is trained upright. If the tree is a year older, and has been treated as above in the former season, the upright is to be cut 1 foot, or four courses of bricks higher than it was formerly. Sometimes a little deviation will be necessary on account of the buds; but generally the upright should be cut immediately above that bud which is nearest the line of brick-work along which it is desirable the horizontals should be trained. The buds to produce the latter will of course be situated below that line; it is proper they should be so in order that the shoots may grow diverging upwards a little way before they take a strictly horizontal direction. These directions with regard to the management of the upright leading shoot are applicable every year till it be finally stopped on reaching the top of the wall or espalier. If the horizontal shoots be weak it will be advisable to shorten them about one-third. The pruning of older trees, on which fruit-spurs are formed, must be deferred till next week; in the meantime the fruit-buds on such will become further developed and easier to distinguish. *Kitchen Garden.*—Continue trenching all vacant ground, draw earth to Peas and Beans as they appear above the surface; a few more may be sown. See that Celery ridges are protected from frost, particularly those in which the plants are most advanced, for if the soil get frozen about these, the leaves, and by degrees the stems, will rot.—*E.*

VI.—ARBORICULTURE.

Old Woods and Coppice.—Continue to fell and thin out, as before recommended. The weather has hitherto been most propitious for planting, and as long as it continues, every advantage ought to be taken in planting, taking care to secure the plants against high winds. Efficient draining ought now to claim especial attention. *Nursery.*—Proceed as before recommended, and protect young evergreens from severe frosts.—*F.*

State of the Weather near London, for the week ending Dec. 4, 1845, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 13th, 1842—therm 61°; and the lowest on the 11th, 1835—therm. 19°.

Notices to Correspondents.

Back Numbers of the Gardeners' Chronicle—The Volume for 1844 can be had, bound in cloth, price 1*l.* 10*s.* The following Numbers in the respective years can also be had. Any Subscriber who will forward to the publisher post-office stamps equivalent to as many Numbers as are required, will have them sent free by post.

1841—1, 8, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34, 46, 47, 49.

1842—4, 6, 8, 11, 12, 16, 18, 23, 24, 25, 27, 29, 30, 31, 32, 33, 34, 35, 42, 50, 51, 52.

1843—10, 11, 12, 13, 14, 16, 17, 18, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 36, 37, 39, 40, 41, 42, 43, 48.

1844—All but Nos. 46 and 50.

Books—*George Simmons*—Miller's Dictionary is not the book in which to look for the anatomy of plants. You had better get something more modern, such as Lindley's "Elements of Botany," or his "Introduction." If you can pick up at an old book-stall Grew's "Anatomy of Plants," that book is full of fine old figures that are very useful.——*A B*—In our opinion you cannot take a better book than Roberts's "On the Vine." His own Grapes, treated in his way, were magnificent. The book may be had, like all common books, through any respectable bookseller.——*G A P*—Thanks; we are well acquainted with the book. It is of small value.

Conifers—*W M R*—There is no book which will give you the information you require. In former parts of this Paper you will find many details: but we think your suggestion a good one and will prepare a list.

Food—We shall next week have a word to say on the relative value of different kinds of vegetable food.

Fruit Trees—*Tola*—You must thin the spurs of your old neglected Pear and Plum trees against walls, by cutting down to within ½ inch of the branch. One-fourth of them may be so cut in; the rest should be considerably shortened. Attend particularly to summer pruning.‖——*A Y*—You would better head back your old Pear-tree 40 feet high, which now scarcely bears any fruit; it will bear after it again makes young wood. If not a good variety graft with a better.‖

Fuchsias—*Sub*—Procure the following 36 varieties:—*Light*—Queen Victoria (Smith's), Alicia (Youell's), Cassandra, Norfolk Hero, Sanguinea (Halley's), Coronet (Smith's), Venusta, Alice Maud, Cleopatra, Nymph (Epps'), Queen of Beauties, Candidissima (Halley's), Chandlerii, Vesta, Duchess of Sutherland, Conspicua arborea, Prima donna. *Dark*—Paragon, Lowryii, Laconii (Youell's), Magniflora (Smith's), Expansa, Kentish Bride (Epps'), Robusta, Countess Tyrconnell, Lady Walsingham, Elegans (Youell's), Erecta elegans, Gem, Hope (Barnes's), Exoniensis, Magnet, Eclipse, Brockmanii, Iveryanii, Conductor.*——*Old Sub—Light*—Smith's Venusta, Barnes's Cassandra, Smith's Queen Victoria, Norfolk Hero, Youell's Alicia, Epps's Nymph. *Dark*—Smith's Magniflora, Lowryii, Kentish Bride, Laconii, Paragon, Countess Tyrconnell.*

Heating—*W X*—You will probably find Mr. Rendle's tank the cheapest for your purpose. It is made of wood.

Hollyhocks—*Original Sub*—Although some plants possess the property of striking from roots, yet it is very doubtful whether or not Hollyhocks possess it. They may be multiplied by dividing the roots in the same way as Dahlias, preserving an eye on each division. However, the experiment is worth a trial. Put your roots in a cutting pan, cover them slightly with light sandy soil, and place them where they may have a gentle bottom heat. The best time will be in spring;

Insects—*B M*—Thanks for the larva; it appears to be one of the Carabidæ. *R.*——*E B*—The larva from the Potato infests Celery, Lettuces, &c. *R.*

Manures—*T H*—You should apply manure-water to Pelargoniums in a perfectly clear state. Once in 10 days will be quite often enough.‡

Musa Cavendishii—*Troublesome*—This is a native of the Isle of France. To grow it well it should have a house entirely devoted to it; but it will succeed in the corner of a Pine-stove if there is sufficient room for the expansion of its leaves. A moist heat, not lower than 75°, suits it best; but of course it cannot always have this in a Pine-stove. Ripe fruit has been gathered from plants only 18 months old grown in pots at Chatsworth, and it is probable that it may be fruited even at the age of 12 or 13 months.‡

Names of Fruits—*Norman*—Your Pear is the Louise Bonne of Jersey.‖——*J E, Cambridge*—Some parcels of Apples were received, unaccompanied by the names of the parties. The following were numbered on thin brown paper in which the Apples were wrapped:—1, Downton; 3, Summer Thorn; 6, Franklin's Golden Pippin; 7, 8, Dutch Mignonne; 9, Woolman's Long; and some others of inferior quality not known.‖——*James Lane*—Your Apple is the Court of Wick Plat.‖——*A Subscriber*—1, Beurré Diel; 4, Gansel's Bergamot; 5, Old Colmar; 6, Aston Town; 7, 8, Easter Beurré; 9, Beurré Rance; 1, White Russet; 2, 3, Downton; 4, King of the Pippins; 5, Dutch Mignonne; 6, Gravenstein; 7, Alexander.‖——*G J*—1, 8, Winter Nelis; 3, St. Germain; 5, Marie Louise; 7, Easter Beurré; 1, Rymer; 2, Dumelow's Seedling; 3, Yorkshire Greening; 5, King of the Pippins; 6, Golden Harvey.‖

Names of Plants—*A Constant Sub*—1, a Stanhopea; 2, a Tillandsia; 3, Epidendrum cochleatum; 4, Polypodium areolatum; 5, an Epidendrum; 6, a Yucca. Plants cannot be named with certainty from leaves only.§——*Rahn*—387 G, Oncidium Insleayi; 10 S, Epidendrum fragrans: 15 G, one of the many varieties of Catasetum tridentatum; 611 LB, seems to be Catasetum Hookeri, but it is so much decayed that we cannot be certain; 609 LB, a very fine pale-green spotless variety of Catasetum maculatum.——*A Balston*—Your plant is unknown to us. It is very curious, and is *perhaps* a Balsamodendron, or some such genus.

Potatoes—*R Rillott*—Your seedling Potato is very good.‖

Potato-seed—*A B M*—Your note had been mislaid. Sow it thinly in a hotbed in the month of January, in light rich soil; when the young plants are 3 or 4 inches high, put them in small pots with some chopped hay mixed with the soil, and keep them in the hot-bed near the glass. If they grow very vigorously, shift them into larger pots, without breaking the ball; the chopped hay is intended to prevent this happening. As soon as the season will allow, plant them out in a warm dry border in light rather sandy soil. After that proceed as usual. Many other methods may be adopted, but this is as good as any, and as little troublesome. Some will tell you that you may sow the seed broadcast in May in a warm light dry border, and it will come up without any preparation. That is true; but you will have lost four months of growth by the delay, and that is a serious consideration. Do not, however, expect too much from raising from seed. A great deal of false reasoning has been expended on this subject as we shall show you; perhaps next week. (See p. 2[illegible] of this year.)

The Peach—*F M D*—You must study the management of the Peach in works that treat of it. We cannot undertake at present to go into its history, &c. &c. &c. Consult Lindley's "Guide to the Orchard;" follow his advice implicitly, and you will have plenty of excellent fruit. If you try experiments, and run after whim-whams, you will perhaps have none.——*J R*—When Peaches hang long on the tree after their usual period of maturity, their flavour invariably becomes deteriorated. Melting Peaches, like your Late Admirable, become mealy, while the sugary nature of the juice is changed. Clingstone varieties, such as the Catherine, retain their qualities longer.‖

Sanguettes—*J P P*—This question has not been introduced on a religious point of view, and we *dare* not admit any such discussion into our pages.

Scotch Thistle—*A Constant Reader*—This is the Onopordum Acanthium: it is regarded as a weed, and therefore its seed is not kept in the shops: but like many other so called weeds it is a noble specimen of vegetation if subjected to cultivation. It is common in a wild state in many parts of England.

Tree Violet—*A B*—This is a variety of the common Violet, and owes its appearance mainly to artificial management. It is said to have come from China, and to have reached the height of 3 feet; but we never saw such a specimen. It is forced to form a stem by pulling off the lower leaves, and tying the stem, as it lengthens, to a small stake. You will hardly succeed in making Tuberose roots blossom the second year. The Leycesteria formosa is a hardy shrub, with thin green leaves. It grows 3 or 4 feet high.

Vermin—*Rustic Robin*—We shall have a word to say presently about the phosphorus pills; they are invaluable. But we would never carry the pills among corn, and if they did, we do not see how people are to be poisoned thereby.

Weeds—*A Yorkshireman*—If you can fork out the creeping roots of the Nettle, do so: if not, persevere in pulling up their shoots as soon as they appear 3 inches above the ground. If you have patience enough to persist in this for a whole summer, you will probably get rid of your enemies altogether.

Worm-casts—*J W L*—By persevering in the use of lime-water, used quite clear, you will get rid of worms; and by adopting Mr. Ayres' advice of using a wooden roller (see p. [illegible]) you will easily remove their casts.

Misc—*A Constant Reader*—What is "the" Amaryllis? Its years all but 17 days, to be sure. The "Journal of the Horticultural Society" can be purchased of all respectable booksellers, when it is published.——*Inquirer*—The best time for *salting!* salting what? We do not understand you.——*Jun Beg*—In the Isle of Man you might plant out all the shoots you name, in a warm place, where there is no wind; thorough drainage, with the exception of the species of Amaryllis. None of those will so succeed except Belladonna. Plant now and throw litter over the young shoots if they come up too soon: or if you are afraid of frost wait till spring.——*A Y*—Your Lupine is probably "arborea," or some allied species. It will scarcely survive the winter unless it is very mild. Its seeds, if ripe, and kept dry will grow next year: and the earlier you can sow them with safety the larger will be your Lupine-tree.——*H L*—We know nothing of any Moss Rose with yellow flowers, exhibited either Dublin or any other place.——*An Old Subscriber*—We do not know that anybody has old Wimbledon Pear to sell.——*J B D*—In order to become a Fellow of the Horticultural Society you must be recommended by some one who is already a member. The admission fee is 6*l.* 6*s.*, the annual subscription 4*l.* 4*s.*, and the whole may be compounded for 40*l.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the required inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Dr. Lyon Playfair, the consulting chemist to the Royal Agricultural Society of England, has kindly consented to deliver Two Lectures before the Members of the Society, on the occasion of their ensuing General Meeting, at 9 o'clock on each of the Evenings of Wednesday, the 10th, and Thursday, the 11th of December, on the following subjects:—

1st Lecture.—On the Causes of the Potato Disease, and on the different methods for retarding or arresting its progress. On Seed for a future year.

2nd Lecture.—On Economising the Nutritive Ingredients of Diseased Potatoes. On the Value of Potato as Food, and its relation to other aliments.

Tickets for the Free Admission of Members to be obtained on application to the Secretary of the Society, 12, Hanover-square.

The Managers of the Royal Institution of Great Britain have liberally placed their Theatre in Albemarle-street, Piccadilly, at the disposal of the Society for the delivery of these Lectures.

ROOMS.—The Rooms of the Society in Hanover-square will be thrown open from 6 to 10 o'clock on the evenings of Wednesday, Thursday, and Friday next, for the accommodation of the Members.

GENERAL MEETING.—The December General Meeting will be held at the Society's house in Hanover-square, on Saturday, the 13th of December, at Eleven o'clock in the forenoon.

By order of the Council, James Hudson, *Secretary*.

London, 3rd Dec. 1845.

The Agricultural Gazette.

SATURDAY, DECEMBER 6, 1845.

MEETINGS FOR THE FOLLOWING WEEK.

Wednesday,	Dec. 10	Meeting of the Smithfield Club, Baker-street, London.
Thursday,	— 11	
Friday,	— 12	
Thursday,	— 11	—Agricultural Imp. Soc. of Ireland.
Saturday,	— 13	—Agricultural Society of England.

It is by *quantitative* analysis alone that the chemist can hope to benefit the farmer. The fertility of a soil is owing to its possession both of the substances necessary as the food of cultivated plants, and of that texture which will best fit it as a vehicle of this nourishment to their roots. Infertility may thus be caused by a faulty texture of soil or (not to speak of the occasional presence of deleterious ingredients) by the absence or deficiency of vegetable food. Remedies for the former will be suggested by the farmer's own practical sagacity; the latter can be fully explained and remedied without risk of waste only by the aid of the chemist; and this can only be effectual when it comes in the form of *quantitative* statements well established upon rigid analyses. It is a striking fact that while the soil has long been spoken of as the storehouse of food for the vegetable world, an idea so full of truth and instruction has till lately been almost utterly inefficient towards agricultural improvement; and we take this as a forcible illustration of the statement we began with, that agricultural chemistry is useful only in so far as it is founded upon quantitative analysis.

The above answer to the question—What is fertility? unfolds to us the entire theory (according to the present state of our knowledge) of one department of farming. Of course in order to its profitable development in practice, it requires to be united with an accurate knowledge of the other parts of the farmer's business; but, still, so far as it goes, it embraces the entire and only explanation that can be given of, what is properly speaking, the art of *cultivation*. There are several subordinate theories connected with the subject; but these may stand or fall without affecting the stability of what has been said. Among these is "the theory which the celebrated De Candolle has so ingeniously and eloquently maintained; namely, that a soil becomes unfitted for supporting a second crop of any given plant, in consequence of the deleterious influence exerted upon it by juices excreted from the former one." We quote from a memoir by Dr. Daubeny* upon the rotation of crops, to which we beg the attention of our readers as a remarkable illustration of the way in which chemical analysis may be employed in perfecting the theory of agriculture. The experiments undertaken by Dr. Daubeny were of this nature:—A number of plants were selected for trial, and a piece of land of uniform quality was chosen as that on which they were to be tried; to each a plot of 10 feet square was devoted, and on some of these the same crop was repealed year after year, while on others the crops succeeded one another. It was hoped, by ascertaining each year the weight of produce of the shifting and of the permanent crop respectively, and by combining the knowledge thus obtained with that afforded by the chemical analysis of a fair sample of each, and of the soil on which it grew, to determine to what any apparent change of fertility must be attributed; whether to the injurious influence of vegetable excretions, or to an exhaustion of the soil of those substances necessary as vegetable food.

We cannot in our limited space follow the author through all the methods he adopted, and the conclusions he arrived at; the recital of which, indeed, occupies upwards of 70 tersely written 4to pages. The following are the main points:—De Candolle's theory is considered unsound, for no foreign organic matter was found in the soil referable to the excretions of the crop which had grown upon it, nor was there that uniform difference between the shifting and permanent crop to the disadvantage of the latter, which would have been expected in accordance with the principles of it; and, the difference observable between the shifting and permanent crop is therefore attributable not to the injury derivable from the presence of excrementitious matter, but to the abstraction from the soil of matters necessary as the food of plants.

The history of each of the crops experimented upon is given, and the results exhibited in the form of curved lines, the height of which above their respective bases represents the amount of the crops during successive years. These indicate almost universally the superiority of the shifting crop over that which was raised permanently on the same land.

A large portion of this memoir is devoted to a report of the chemical analyses of these crops, conducted by Mr. Way, Prof. of Chemistry at the Cirencester Agricultural College. There are many points connected with these analyses which we should like to have mentioned; especially the mode exhibited in them of analysing a soil so as to develope its true agricultural value; but want of room obliges us to defer this.

The results, then, of Dr. Daubeny's inquiry may be fairly considered as disproving De Candolle's theory; and it thus appears to us that there is no hindrance in the way of a more perfect knowledge (to be derived from the researches of the chemist) hereafter, enabling us to cultivate repeatedly, and during successive years, those crops which are most valuable as human food.

Doubtless there are other reasons besides those of which chemists can take cognizance, for the practice of what is called alternate husbandry, on which all good farming is now founded; it would doubtless be impossible on many soils, with our climate, to cultivate the land properly under the growth of successive Wheat crops. And it may illustrate this point, to consider the way in which different writers have treated other farm subjects, that, for instance, of fallowing; while some learned professors attribute its effects to the action of light, and others discourse fluently of the agency of natural solvents in preparing during its operation fresh stores of food for successive crops.—"Take notice," says a practical writer, "the main use of the fallow is to destroy weeds." There is, however, we are persuaded, but little doubt that (when improved implements shall have enabled us to overcome one class of difficulties, and improved chemical knowledge the other) we may find our agriculture profitably directed to the cultivation of Wheat year after year on the same land.

* Memoir on the rotation of crops, and on the quantity of inorganic matters abstracted from the soil by various plants under different circumstances. By Charles Daubeny, M.D., F.R.S., &c. From the "Philosophical Transactions," Part II. for 1845.

AUTUMN-PLANTED POTATOES.

I have had many inquiries on this subject similar to that from your correspondent signing himself "A Yorkshireman," arising from the great anxiety naturally produced by the present prevailing and increasing disease among Potatoes—to secure seed for the ensuing crop. If "A Yorkshireman" had read with attention the detail which I gave of the cultivation of the land on which my Potatoes of 1844 were grown and the result of the experiment, as published in October, 1844, and again repeated at p. 788, he would have known all that I can tell him on the subject. He seems to think with others, that some peculiar precautionary measures are necessary to preserve the sets in winter, and the shoots in spring, from destruction by frost. I have used none, save to plant in pretty large drill rows, measuring 30 inches in width from top to top, and admitting of being set up by the plough to the height of 8 or 9 inches. In this condition they remain till the end of March or April, when, if the land be dry enough, they are harrowed down, by which the top crust is broken, the air is admitted, and the plants are left at liberty to shoot out, which they do, but not much in advance of those planted at that time, although with greater vigour, the sets having been preparing themselves to take the first benefit of the spring, and to draw immediate nourishment from the soil.

The practice of autumn planting does not rest with me, nor have I any merit in introducing it, although I may have taken more pains than others in ascertaining the comparative produce of different times of planting and of giving the result publicity through your columns. The plan is followed by many farmers in the northern parts of this county, in Glendale, and on the Tweed, where the land is free and dry; and I believe the only objection and risk attending it, arises from the difficulty of preserving the sets from the depredation of rooks in localities where gentlemen choose to protect them to a mischievous extent. I would not certainly hope to grow Potatoes in this way upon land so wet that a hard frost would turn it into a band of ice, or in clay which contracts and expands with the alternations from frost to fresh, and *vice versa*; but in dry free loam or sand, little danger is to be apprehended. It is a mistake, I believe, to think that the vegetative power of Potatoes is destroyed by frost, if not in contact with water, and if they are frozen in the ground and thawed in the ground. If a frozen Potato were thawed by artificial means, by putting it in hot water or near a fire, it would, of course, be destroyed by the decomposition that would ensue; but every one may remark (and it would be well if we would note the operations of nature with keener observation, for then we should learn many useful facts, and be saved from some troublesome doubts) that the Potatoes which are missed in gathering in autumn are found to shoot up in spring, and to be rather annoying among the Wheat and Clover. These have had no care bestowed upon them, but have lain all the winter, probably within 2 or 3 inches of the surface.

My Potatoes for the ensuing crop were planted in the last week of October in the manner I have already described, on free land which had produced Oats, and been made fine by two ploughings and harrowing, and had been limed before being set up into drills; but I believe they would have been equally safe if planted on the flat row system, by setting them in each third furrow, which leaves the width of two intervening furrows for cleaning the land and earthing up the plants. I took no precaution as to the seed, for in ten loads which were planted, partly whole Potatoes, and partly large ones cut in two, there was no disease visible; but, were I planting now, since I have seen the destruction of so many Potato pits in the neighbourhood, I should cut all the sets, throwing out of course any that showed indications of disease, lay them on a floor, and dust them with quicklime, turning them at the same time for three or four successive days, that the lime might extract any superfluous moisture, and destroy any latent parasitical fungus that might exist. I do not pretend to say that autumn planting offers any security against the prevailing calamity; such escape is likely to be merely accidental, for if the disease originates in atmospheric causes at a particular stage of growth, that stage may be passed by in one instance and not in another, but in this season it is important that seed should be secured, and that an early supply next year should be obtained.—*J. Grey, Dilston.*

ARTIFICIAL MANURES.

I am so deeply impressed with the conviction that nothing less than a very extensive series of experiments, repeated over and over again with the greatest perseverance, can give the science of agriculture any tolerable degree of certainty with respect to the utility of the artificial manures, or the comparative advantages of different modes of cultivation, that I hesitate not to send you an account of those which I have continued to try this year on Grass and corn, although, taken alone, they add little that is decisive to our previous knowledge on those subjects. First, then, I was desirous to ascertain what effect would be produced upon the crop of hay in the ensuing season by some of the artificial manures, if they were applied to the pasture land as a top-dressing before the autumnal growth was over. The subjects of this experiment were guano, sulphate of ammonia, sugar scum, and wood ashes. The produce was weighed both in the state of Grass, and after it was made into hay, and in every instance compared with the produce of an equal quantity of contiguous ground left unmanured. The rate of contraction in the process of conversion into hay was so uniform that there was no difference worthy of notice, the weight of the Grass being as nearly as possible as 3 to 1 of that of the hay.

	Weight of Hay per acre.			Cost of Manure per acre.		Profit.			Loss.	
	Tns.	cwt.	lbs.	s.	d.	£	s.	d.	s.	d.
1½ cwt. of Guano	1	15	66	14	1½	..			1	9
1 cwt. Sulph. of Amm.	1	10	106	19	6	..			7	1½
3 cwt. of Sugar-scum	1	12	56	8	0	..			8	0
40 bshls. of Wood-ashes	1	17	68	15	0	1	4	0	..	

These results are very much what might have been anticipated. In the two first cases the Grass was much strengthened, and the produce was more by many hundred weight than on the unmanured portions; but still the additional growth was not sufficient to repay the expense of the manures, for much of their volatile parts must have been dissipated in the air during the winter, and some of their soluble parts carried down by the rain into the subsoil. But the wood ashes, being for the most part an inorganic manure, remained without loss about the roots till renewed vitality enabled them to appropriate as much as was required. The sugar-scum alone remained quite inactive, and though its fertilising powers have been highly eulogised, I can only say that having tried it in various ways, I have never been able to discover them. If the failure had been confined to this single instance, or if it had been counterbalanced by opposite evidence, it would have been rash to pronounce it as worthless, as I now consider it; for even guano stands in the same predicament as far as a single experiment is concerned. A portion of unmanured ground produced 1 ton 7 cwt. 2 lbs. of hay, to which no addition was made by a dressing of 2 cwt. of guano in the spring on the adjoining acre. The whole of the cost, therefore, 19*s.* 6*d.*, was apparently thrown away; but fortunately other experiments were made which tell a different story:—

Guano applied.	Without Manure.			With Manure.			Profit.			Loss.	
	Tns.	cwt.	lbs	Tns.	cwt.	lbs.	£	s.	d	s.	d.
2 cwt.	2	4	98	2	7	109		..		7	1½
2 ,, ...	2	2	55	2	7	109	0	2	6	..	
1 ,, ...	2	0	26	2	3	37	0	2	7½	..	
1 ,, ...	1	15	66	2	4	98	1	2	4	..	

In the first case, where a loss was incurred, it is

very likely that the balance would have been on the other side, if half the quantity of guano had been used, for the increase of hay was exactly the same as that produced by 1 cwt. in the third, both crops being large, without the assistance of manure, which, as might be expected, gives most remuneration where it is most needed, though not in any regular and fixed proportion. The cause of this irregularity is obvious enough; you never can be sure of the complete similarity of any two portions of soil, even in the same field, which you may wish to compare; thus, for instance, difference in the weight of hay upon two of the above-mentioned portions of unmanured ground lying very near together, and under precisely similar circumstances, amounts to almost half a ton. This source of uncertainty must be borne in mind throughout, in order to account for much apparent contradiction, and it shows the necessity of a very extensive series of experiments if we would arrive at anything like the truth. Three trials were made with sulphate of ammonia only, one of which succeeded; two with phosphate of potash, and one with superphosphate of lime, all of which failed; that is to say, they did not repay the expense; only one square perch of each was actually weighed, and the effects which they actually produced will be best represented by showing the additional pounds of weight that were gained by them respectively.

1 cwt. Sulphate of Amm.	Phosph. of Potash.	Superphos. of Lime.
No. 1, 3½; 2, 6½; 3, 14½	No. 1, 1½; 2, 5	5

The bulk and value of the crops calculated by the acre stand thus:—

Manure.	Without Manure.			With Manure.			Profit p. acre.		Loss p. acre.	
	tns.	cwt.	lbs.	tns.	cwt.	lbs.	s.	d.	s.	d.
Sulph. Ammonia 1	1	7	2	1	8	76	..	..	12	10
,, ,, 2	2	4	98	2	7	109	..	..	7	1½
,, ,, 3	2	1	8	2	7	109	8	1	..	..
Phos. Potash.. 1	2	2	55	2	3	37	..	..	7	2
,, ,, 2	1	18	77	2	1	8	..	..	1	0
Superphos. Lime.. 1	1	17	93	2	0	26	..	..	1	0

I know not how to account for the failure of the sulphate of ammonia, No. 1; for the season was not unfavourable, and the soil was not too rich; but it must be remembered that in using volatile manures (for sulphuric acid does not deprive the ammonia of all its volatility), much that is taken up by the air will be carried down again by rain to the adjoining ground, and fertilise it without our consent. A remarkable example of this is given by the October Number of the "Farmers' Magazine," in an extract from the American edition of Liebig, where it is stated that a piece of land was kept in a constant state of fertility, solely by the descent of vapours from a large mass of fermenting matter, accumulated from time to time on the other side of the fence, in a position where nothing in solution could reach the soil. Sometimes, too, the decomposition of the salt may perhaps leave behind a quantity of the acid injurious to vegetation. One more experiment, however, shows under what circumstances it may be used, not only without detriment, but with advantage. Eight barrels of urine from the cow-yard, neutralised by 40 lbs. of sulphuric acid, and applied to a rood of land, gave a profit of 14*s.* 9*d.* per acre, after deducting 10*s.* for the cost of the acid. This, then, may be added to the numerous proofs already adduced to convince the farmer how much loss he suffers by neglecting to collect the liquids of his yards, and a similar lesson may be learned from the following experiment upon Wheat:—

	Straw.		Corn.		Straw p. acre.		Corn p. acre.		Weight p. bush.
	trus.	lbs.	bsh.	gal.	trus.	lbs.	bsh.	gal.	lbs.
15 loads of dung on 15 perches, gave	8	29	2	6	93	32	28	6½	62
4 barrels dung-water = 320 gal...	7	26	2	7	83	13	29	5½	61½

This looks like a decided superiority in the yield of grain to be awarded to the liquid manure, and certainly warns the farmer to avoid the wasteful management of neglecting such valuable assistance; but it must be observed that the other crop was much injured by being laid, and had it stood up, the greater bulk of straw would have borne a greater proportion of grain. In the next place I have to notice a few experiments upon Oats, and the effect produced upon them by some of the manures. The acreage is calculated from 20 perches.

Black Tartarian Oats.	Straw.		Corn.	Weight p. bush.
	trus.	lbs.	bushels.	lbs.
1 Drilled without manure.....	114	24	75	34¾
2 Drilled with 2 cwt. of guano.....	126	16	77	35¼
3 Broadcast, with 1 cwt. of Sulphate of ammonia.....	131	20	81	36½
4 Broadcast, with 2 cwt. of guano..	154	24	95	35¼

But it is worth while to observe not only the effect of manures during the same season immediately after their application, but also in the following year, in order to see how far their operation is transitory or lasting. The sort of manure used for the Turnips of last year has had a considerable influence upon the crop of Oats, which followed them in this present year.

Black Tartarian Oats.	Straw.		Corn.	Weight pr. Bshl.
	trusses	lbs.	Bshls.	lbs.
1. Bones and sulphuric acid in 1844	131	4	85	37
2. Common farmyard manure in do.	143	12	89	37
3. Manure from beasts fed with oil-cake in do.	164	16	96	37

These were all broadcast, and in the preceding set of experiments it will be seen that the best crops were sown in the same way; in order to ascertain the real value of this mode of cultivation compared with drilling, a trial was made of both in two places, and I subjoin the results, calculated from ¼ acre:—

Wheat.	Straw.		Corn.		Weight pr. Bshl.
	trusses	lbs.	bshls.	galls.	lbs.
1. Sown broadcast	82	10	39	—	61
Drilled at intervals of 9 ins.	75	16	35	2	61
2. Sown broadcast	115	4	43	2	63
Drilled as before	125	16	44	7	62
Another part also drilled	134	—	45	—	62
Drilled & horse-hoed once	116	32	44	6	62
Drilled & horse-hoed twice	161	28	49	—	60

Thus it appears that where the soil was indifferent, broadcast had the advantage, but not where it was good, except in point of weight; in one respect it is always entitled to some advantage if it is harrowed, and if the harrow stirs the ground as effectually as the horse-hoe, which, however, may be doubted. If the same quantity of grain be distributed over the same quantity of ground, the broadcast system will have the same advantage over the drill as trees planted in the quincunx order have over an equal number planted in straight lines. Let eight, for instance, be the number; how much better will they be planted thus : : : : than thus : : : : ? they are much less crowded, and have a much more equal share of light and food; but the greater facilities for keeping the crop clean (that indispensable condition for all good farming) ought always to turn the scale in favour of the drill. Moreover, the crop can be horse-hoed for the purpose of opening the soil after it has grown too tall to be harrowed, and the comparative failure of benefit from a second hoeing, shown in the last experiments, may be easily explained. That part of the crop was very much laid; the vast increase of straw shows that the opening of the soil, by the hoe a second time, encouraged the plants to tiller afresh, and to throw up more stems than the soil could sustain in such a season as the last; in a stronger soil, no doubt, the increase of grain would have been in proportion to the increase of straw.

3. Another object of my experiments was to compare the value of a crop from thin-tailing corn with that of which the seed was good; the quantity of ground in each case was 32 perches, and, calculated by the acre, the account stands thus:—

Wheat.	Straw.		Corn.		Weight of Bshl.
	trusses	lbs.	bshls.	galls.	lbs.
Good seed	100	20	41	2	60½
Tailing Wheat	93	7	41	2	60½

It is certainly very remarkable that though the thin seed produced much less straw, yet it yielded the same amount of grain as the good; and, on the other hand, that though the weight was the same, yet the sample, being much affected by smut, was very inferior in value. Similar experiments were made, but with further views, on a smaller scale in garden-ground; but though they were conducted with the greatest care, the results were so extremely anomalous, that it is difficult to glean from them any useful information; instead, therefore, of troubling you with all the details, I will select such points as seem to be most curious. My object was twofold; 1st, to see whether by any mode of treatment the bad seed could be made to yield as much grain as the good; and 2dly, how far the fertility of the soil could be maintained, when forced to bear Wheat year after year, by the application of certain salts. The same plot of ground, therefore, upon which the experiments were made last year was treated exactly in the same way this year, and the same salts applied to the same portions of it. 1st, two spaces, of 160 square yards each, were divided as before into four squares of 40, and sown—the one with tailing Wheat, the other with good wheat; in each of them one square was left without manure, the same which had received none the year before—as a sort of zero in the scale of fertility, by which the advantage of each manure was to be measured.

		1844. Wt. of Straw	1844. Wt. of Corn.	1845. Wt. of Straw	1845. Wt. of Corn.
		lbs. oz.	lbs. oz.	lbs. oz.	lbs. oz.
1	4 lbs. Sulph. Amm. Good Seed.	29 4	19 2	25 5	11 4
	6 lbs. do. Bad Seed.	29 14	19 12	24 12	11 2
2	2lbs. do. 2lbs. Ph. Pot. Good Seed.	28 14	18 10	26 12	11 2
	3 lbs. do. 3 lbs. do. Bad Seed.	27 4	17 2	25 8	11 1
3	4 lbs. Phosph. Pot. Good Seed.	27 6	17 4	34 8	17 4
	4 lbs. do. Bad Seed.	25 8	15 6	22 12	14 9
4	Without Manure. Good Seed.	24 0	13 14	28	14 6
	Ditto Bad Seed.	20 8	11 6	23 8	11 6

The principal things to be here observed are—1st, That the phosphate of potash was by far the most efficient manure, the produce where the seed was good being just the same as last year, and even where it was bad beating all the others. 2nd, That the good seed without any manure gave a better return than the same ground did last year, and the bad not less. And 3rd, That where the ammonia was used, the bad produced almost as much as the good, and both were inferior to both the good and bad which had received no manure at all. But there was one circumstance in this experiment too remarkable to be omitted. On the two squares where sulphate of ammonia had been used, the bad seed seemed in the spring to have failed almost entirely: the ground was almost bare: perhaps the ammonia was too strong for plants which, in their first development, could not be otherwise than very weak. Anxious to repair this mischief as much as possible, I ordered a sufficient number of plants from the bad seed to be taken up from the other part to fill up, by the division of their roots, the deficient rows; and a week after the operation, when they had taken root, they were watered with half the same quantity of sulphate which had been applied before; still they did not stand near so thick together as on the good seed squares, and if they had not grown very vigorously, and thrown up an unusual number of stems, the straw could not have approached even near to the quantity which the others produced; and if they had not been very severely blighted, the produce of grain must have been considerably greater. The four other spaces, containing 160 square yards each, the seed was previously steeped in four different solutions of salts, and half of each was watered afterwards in the spring with different proportions of the same solutions in which the seed had been steeped. Each half was subdivided into four portions, but I merely give the general results.

	Wt. of Straw	Wt. of Corn.
	lbs. oz.	lbs. oz.
Watered with 2 or 4 oz. of Sulphate of Soda	65 12	27 ..
Steeped in do. but not watered.....	61 12	24 ..
Watered with 2 or 4 oz. of Phosphate of Soda....	51 6	22 ..
Steeped in do. but not watered.....	56 ..	23 ..
Watered with 2 or 4 oz. of Muriate of Ammonia..	52 12	22 ..
Steeped in do. but not watered.....	54 12	23 ..
Watered with 2 or 4 oz. of Nitrate of Potash	57 12	24 ..
Steeped in do. but not watered.....	44 6	18 ..

In all these cases, the quantities under the same treatment last year were greater, but then it must be remembered that throughout the country Wheat last year gave more than an average crop. The nitrate of potash was not fairly used, being overshadowed by a large Apple tree, and more exposed on that account to the attacks of birds, but the bulk of straw was much greater than last year. But what is most worthy of notice is, that in the 1st and 2nd experiments, the seed which was only steeped, bore a greater amount of grain than that which had the additional manure of the solutions; and in the 2nd and 3rd a greater amount of straw. I might state the effect of the different hoeings which each quarter received, but these are "conclusions from which nothing can be concluded." I have only one other experiment to mention, but it is one which may deserve further consideration. In the spring of last year I received from Sir John V. B. Johnstone 4 heads of Indian corn, presented by Mr. Colman to the Agricultural Society. The Tusconora and Sweet corn I found of no value, but the Parker corn produced fine vigorous plants, which grew to the height of five or six feet, but it was sown too late to ripen its seeds, nor do I think it can ever be depended upon for that purpose in this country. The Canada corn was not so strong, but much earlier, and ripened enough of its seed to sow one-eighth of an acre this year. Though it was sown in a soil by no means rich, the weight of the produce was at the rate of more than a ton to the acre at the end of September. At that time I began to cut it for the cows, being the season when the milk usually begins to diminish from want of sufficient nourishment in the Grass. For one week I measured the milk of a cow grazing in the ordinary pasture, and the next week I fed that cow exclusively upon Indian corn. She ate it most greedily, but fell off in condition, and gave less milk. She was then turned out to Grass again, and had only a bundle of the corn given her every night and every morning for another week. In that week she gave 18 quarts of milk more than she had done before. It may be a question, therefore, to be determined by further experiments, whether the Parker corn, which would give so much greater a bulk of green food, might not be usefully introduced every year from America, to assist our dairies. There can be no fear of its exhausting the soil; for, since the whole of the plant is eaten in that state, whatever is not given in the shape of milk would be returned to the land in the form of manure.—*L. Vernon Harcourt, West Dean House.*

ON THE CHOICE OF A VARIETY OF OAT FOR CULTIVATION;

AND CORRECTION OF AN ERROR IN HIS REMARKS ON THE BAKING QUALITIES OF WHEAT.

By Sir G. S. Mackenzie, Bart.

It has already been shown that those kinds of Wheat which contain the largest proportion of nutritive matter should be selected for cultivation, and that the weight of the bushel is no criterion of value. Before proceeding to the consideration of the Oat, it is necessary that a great error (in my papers, published some weeks ago), which I inadvertently committed and only lately discovered, should be corrected. In Table 1, the quantity of albumen in the Coul Wheat is stated as 9·0 instead of 0·9. This produces an error in the 2d Table, 21·8 instead of 13·7; and in the 3d Table 27·4 is put down instead of 19·3. Notwithstanding this error, the Coul Wheat stands at the head of the list, though it beats the finest Silesian only by 0·7. As it shows so high a quality grown in the north of Scotland it becomes a valuable variety for cultivation. I have three hybrids, and, unfortunately, am uncertain which of the three was analysed; and I was not aware of its value till the analysis was made, and did not propagate it in any quantity. I mention this in consequence of inquiries having been made for it; and I may add that all that I had of the three sorts is now sown, and they will be analysed next year, so that the best may be propagated.

Strongly suspecting that the real value of different varieties of Oat was unknown, and that weight by bushel was even less applicable to this grain than to Wheat, I procured samples of nine sorts, carefully selected by Messrs. Lawson, of Edinburgh. I have not had them

compared chemically; I leave that to those great and wealthy bodies, associated for the ostensible purpose of conferring benefits on the farmer. I have followed a simple mechanical process, which any one may follow. The weight of each sort per bushel having been ascertained, the following Table was constructed according to the results:—

Weight per bushel of

	lbs.		lbs.
Siberian Oat	45	Potato	41½
Sandy	42½	Early Dyock	40½
Kildrummie	42	Late Angus	40½
Early Angus	42	Black Tartarian	39
Hopetoun	41		

The useful part of the Oat being the kernel, and it being probable that the proportion of the weight of the husk to that of the kernel might vary so much as to render the weight per bushel a deception, 100 parts by weight of each sort were taken, and the husk and kernel carefully separated. The following Table shows the result.

In 100 parts by weight.

	Husk.	Kernel.
Sandy Oat	21	79
Early Angus	21	79
Late Ditto	21½	78½
Potato	22	78
Early Dyock	25	75
Black Tartarian	25	75
Hopetoun	26	74
Kildrummie	28	72
Siberian	31	69

It is curious that the Oat at the head of the first Table should be at the bottom of the second. There may be as great differences among Oats as among Wheats in regard to their nutritive qualities, and until this shall have been ascertained by the chemist, we shall not know the real comparative values. In the mean time there need be no hesitation in preferring the Sandy Oat over all others, as it is very early and very productive in grain and straw.

Home Correspondence.

Experiments on various Forage Plants.—Produce from 1 customary perch (Cornwall), Trifolium; 1 do. Vetches; 2 do. Clover and Rye-grass:—

	Trifolium.	Vetches.	Clover and Rye-grass.	Clover and Rye-grass.

Quantity of hay per 10,000 of green produce	1587	1602	2523	2713

The weather proved extremely unfavourable for saving the hay produce, which towards the conclusion of harvest was several times exposed to heavy rain, though it was eventually weighed in an extremely dry state in sunny weather; hence the loss in the barn in six weeks was less than would otherwise have been the case, and no apparent change occurred in the appearance of the hay produce. The Vetches were grown in a peaty soil mixed with clay and stones; they had taken a second growth, and while the lower part of the stem was too old the upper portions were too green; this part of the trial was not considered fair enough to be continued in the barn. The Trifolium grew on dry ground, but it had been sown extremely thick for cutting green, and consisted of succulent stems. The blossom on the lower part of the head was withered, but the outer skin of the seeds only had been formed. The produce was a soft tough straw. The Clover was in full and the Rye-grass in partial blossom, and the produce proved to be tolerable hay. The soil in which both these crops were grown is a clay slate loam. Having constructed recently a table deduced from this trial of the weights per acre of the dried obtained from the green produce, I have forwarded it to this Paper for insertion, in case it should be deemed of sufficient interest. The trouble and attention required to insure tolerable accuracy need not be insisted on; hence, perhaps, a record, even of imperfect trials, in which all the conditions are not quite equal, may still be held to be of some use, provided they are fairly stated.—*John S. Greys, near Penryn.*

Electro Culture.—I laid down experimental wires on various portions of my Tiptree Hall Farm, the plots varying in size from 1 to 7 acres, the whole extent being 44 acres. So far as these experiments go, there is an entire failure, the crops non-electrified being quite equal to the enclosed plots. In April, whilst my man was connecting the wires, he got three smart electrical shocks, in each case from the wire over the pole, proving the occasional passage of a considerable current of electricity. Still no beneficial results are shown. The laying down of the wires was seen and approved by Dr. Forster himself.—*J. J. Mechi*, 4, *Leadenhall-street.*

Potatoes.—It has been the observation of myself and others that the pigs fed on the infected Potatoes have fattened faster than on those that were not damaged, and I think Liebig accounts for this in his theory of the change that has taken place in the darkened parts of the Potatoes. I had an acre of Potatoes planted early, and though most of them were injured, yet I do not find them become worse. The great thing is to keep them dry. I find cows and sheep eat them readily, and thrive upon them. I have planted Potatoes this autumn, and some where the infected Potatoes grew, and am inclined to think that I shall have as good a crop there, and as free from damage, as elsewhere.—*J. W. L.*

Potatoes.—The following is copied from a work published in 1789, which may prove interesting, as showing the value placed on the Potato-crop, and the attention paid to its cultivation:—"The ground for Potatoes should be well manured with rotten horse-dung, and the seed changed every year. They should also be planted in fresh ground every year; for, if either fresh seed or the same seed be planted in the same soil two or three years successively, the crops will in general fail, the haulm come up curled and blighted, and the roots will be worm-eaten and cankered." The Norfolk Agricultural Society gave a premium to Mr. Wright, of Great Melton, for planting and gathering the best crop of Potatoes, the quantity of land being one rood, and the produce 91 bushels. On that occasion the Society strongly recommended the cultivation of that most valuable root.

Calculation for Cultivating one acre of Land with Potatoes, according to Mr. Wright's Expenses, and the Valuation of his Crop:—

One deep ploughing	£0	4	0	Produce 91 bushels at 1s. per bushel	£4	10	0
Thirty-two bushels of seed, 1s. p. bshl.	1	12	0	Expenses, deduct	13	2	0
Twenty-four loads of manure at 2s. per load	2	8	0				
Expenses of setting	1	0	0				
Hoeing and earthing up several times	1	0	0				
Rent, &c.	1	10	0				
Expense of taking up	5	8	0				
	£13	2	0	Clear Profit	£5	2	0

The item "taking up" exceeded the usual cost by one-half, in consequence of the ground being riddled up, &c. The soil was also ready manured for another crop; both the extra labour and manure should therefore be carried to the profit account, which would increase it to nine pounds.—*Falcon.*

Cause of Potato Failure—Autumn Planting, &c.—The cause of disease has been ascribed to the want of new varieties raised from seed. Now, during the first year, Potatoes so obtained are of no benefit as an article of food. They are so small and so undecided in character, that the cultivator is obliged to plant the tubers year after year, to ascertain if they are likely to prove of value for stock. Thus it appears that the natural process to develope the virtues of the Potato is the very system now universally pursued. The physiology of the Potato points out the only means of keeping a good sort when once acquired from seed. The fault does not lie in continuing the Potato annually by either planting it whole, or cut, but in carelessness in saving, setting, and manuring the crop. Although the Potato may be considered as climatised, yet it will be most advisable to pay more attention to its cultivation than has hitherto been done; not merely putting the sets in the ground in the spring, and taking them up in the autumn, something more is requisite—studying the habits of the plant. The selection of seed has been too much either a matter of chance or convenience. The Potatoes for this purpose should be of a middling size, ripe, and allowed thoroughly to dry previous to being placed in store. I question much if throwing large masses of Potatoes together, and permitting them to heat is at any time likely to improve their condition; fermentation must surely impoverish their strength, and, to a certain degree, alter their nature. Then again, on opening the stacks in the spring, the greater proportion of the Potatoes are found to have thrown out long white shoots from most of the eyes, which have to be broken off before planting. These evils should be avoided if we wish to ward off disease, and preserve this nutritious root in all its vigour. Potatoes like a moderately rich earth, the soil should be well drained and pulverised, leaving it turned up rough during the winter, exposed to the action of the atmosphere and cleansing frosts. Little thought has hitherto been given to the constitution of the Potato, at least not sufficient to insure a uniform system being adopted in its cultivation. The remark is not uncommon, "Oh, a Potato will grow anywhere;" so it will, but there is a great difference between simply vegetating and arriving at perfection. Raw manure is often applied to the sets in the trenches to keep them loose, or otherwise to give them room to swell in a stiff soil; would it not be better to take more trouble to render the soil less tenacious and sour? well rotted farm compost mixed in the ground previous to planting would suit better. Too much manure is injurious, either rendering the tubers large and watery, or forcing the stalk and leaves, to the destruction of the main crop. The cold and wet during the last summer have no doubt been the principal agents in fostering the murrain, rendering the Potatoes predisposed to generate the fungi which now infect them, and which are probably of spontaneous growth, attributable more to the condition of the Potato being favourable to their production, than the fungi being the primary cause of all the mischief. On opening many Potatoes, which in outward appearance were not affected, I found that decay had already extended about a quarter of an inch below the surface without breaking through the skin, leading me to suppose, that although the fungi increase the malady to a fearful extent, they are in the first instance occasioned by the unhealthy state of the Potatoes, consequent upon atmospheric influence and improper cultivation. On examination I have also found some bladder like spots on a few Potatoes, which, when broken, contained innumerable fungi, tending rather to confirm me in my statement of spontaneous production. I perceive that it is strongly recommended "to plant immediately," some autumn crops of last year having proved excellent. Surely great caution should be used in placing Potatoes in the damp soil, an excess of moisture having already done so much damage. Believing, as I do, that the only means of stopping the murrain in its ravages is by thoroughly drying and putting away the Potatoes in either wood ashes, powdered charcoal, or slaked lime, in small heaps, and looking at them frequently. I must be permitted with all deference to the opinions of more scientific men, to caution gardeners and farmers against the rash experiment of autumn planting this year. It appears to me adding fuel to the flames.—*Falcon.*

Farmers' Clubs.—Your correspondent "H." at p. 777, under this head, refers to an antiquated book, by Knight, relating to a journey through Berkshire. A description in his time would be a libel upon the country at the present day; the 10 and 50-acre men are gone long ago; the present race of agriculturists rank as high in their pursuits as any, and the majority of them vie with the Norfolk men; I could name many who farm upwards of 1,000 acres, and one with whom I am acquainted 2,000; the land done in a systematic manner, the crops beautiful; the farmer alluded to gained a silver cup last year for his superior sample of Barley. If your correspondent "H" will attend the forthcoming Newbury Cattle Show, on Friday, 5th December, he will have ocular demonstration of the doings of the Berkshire men. With regard to Farmers' Clubs, we have many established for some years [Will you be kind enough to give us their names, and the addresses of their secretaries?] in the county, and well supported. If your correspondent feels inclined to visit Berks, on leaving Reading by coach westward, the first farm I would call his attention to is, Mr. Stephens, Prospect-hill, the next to Colonel Blagraves, Colthorp, Mr. Shackles, Mile-house, Mr. De Bevoir, Englefield, the next (a model farm) Mr. John Stephens, Benham, Mr. Folks, Midgam Lodge, Mr. Caves, Thatcham, Mr. Northaway, Henwick; from thence to Newbury, if inclined to journey further to Hungerford, on the road, he will observe the improvement since Knight wrote, or if he takes a ride northward on the Oxford road, there he will perceive the land done as complete as if cultivated by the London market-gardeners, so clean and so excellent is the general system. Among the many Berkshiremen who have benefited agriculture, I could name, there is one stands pre-eminent, Philip Pusey, M.P. I hope I have not trespassed too long upon your valuable Paper, but could not quietly suffer a slur undefended upon the Berkshire men.—*F., Snelsmore-hill, Nov.* 22.

The Lease.—Like many other people at the present moment, the question of Leases occupies a good deal of my time, and the paper signed a "Looker-on" in your last Number is a valuable addition to our stock of information. Will you allow me to ask one question to help me in my search after truth? A lease is undoubtedly a security to the tenant; but supposing before his lease is expired, the tenant dies, leaving no person competent to carry on his farm; or is bankrupt; or from any other reason is obliged to quit his farm. What has the landlord then to fall back upon? He must, as it appears to me, in self-defence, consent to cancel the lease. It, therefore, seems to an ignorant person like myself, that the granting leases must be a unilateral business, much in favour of the tenant, but nothing to meet these objections on the side of the landlord. By inserting this letter in your Paper, I may be favoured with an answer satisfactory to *A Young Landlord.* [A landowner would be much *benefited* by the sudden reversion into his hands of land occupied under lease before the natural expiring of it, were that under any circumstances possible. But the tenant's death places the occupation in the hands of his heir, and the advantage, during the series of years which has yet to run, still due to the tenant as the produce of *his* invested capital, is too valuable for it to drop into the landlord's hands for the want of a claimant. You may depend upon it the lease is no "unilateral" affair; the landlord benefits as well as the tenant, and for this reason among others, because much of the outlay which it is the interest of the tenant to make is invested in the *permanent* improvement of the estate.]

Stall-feeding.—In your Paper of the 22d inst. there is an article on stall-feeding milch cows, in which that practice appears to be condemned, whilst in other cases it has been much commended. I think that the system was not fairly carried out by your correspondent. That milking-cows will not do on cut Grass only, I am persuaded. In stall-feeding, the extra quantity of stock that may be kept, and the extra quantity of manure that may be made, will enable the individual who adopts this system to add a certain portion of oil-cake, or Bean-meal, to each cow's allowance. In this way, I am strongly inclined to believe that the system would answer, regard being had to the health of the animal by allowing her sufficient exercise. You would, I am sure, be conferring a great benefit on some of your numerous readers by endeavouring to remove the difficulties which the contradictory statements of correspondents have a tendency to create. No plan should be found fault with which has not been tried in a manner calculated to exhibit it to the best advantage. This question of stall-feeding milch cows is one on which I should be glad to

have your opinion.—*T. Randell, Bradley, Feckenham, Novembe* 24.

Relative Value of Oil-cake and Guano.—"If we had a 10*l.* note to spend upon manure, we would certainly purchase oil-cake, and feed cattle, old or young, rather than buy guano." Such is the conclusion of an advice to one of your correspondents in last week's paper. It involves a question of considerable importance, and as I differ from you in its solution, I take the liberty of stating my reasons for doing so. A 10*l.* note will purchase a ton of oil-cake; its value to the farmer may be estimated as follows:—At 5 lbs. per day for each, this quantity will, with Turnips, feed two cattle for seven months, which may leave a gain of 1*l.* per month each, or 14*l.*, one-half of which may be supposed to be due to the oil-cake £7 0 0

In that time the two cattle will produce 20 loads of dung, which will be one-third more valuable on account of the oil-cake. The oil-cake may, therefore, be said also to produce 10 loads of dung, worth on the farm 3*s.* per load . . . 1 10 0

£8 10 0

So that 8*l.* 10*s.* is what the farmer gets for his 10*l.* worth of oil-cake. Now, take a farm managed on the self-sustaining principle, that is to say, producing within itself manure sufficient to carry on a system of crops, and suppose that by adding guano to the crops, an additional produce is obtained, it follows that all this increase, less the cost of the guano, is profit. To ascertain the amount of this profit on a four-course rotation, let us take, as an example, the results of some experiments published by the Highland Society.

On Clover—2 cwt. Peruvian guano gave an increase to Mr. Gardner, Barochen, valued at . . .	£3	17	3
On Oats—2 cwt. gave an increase to the same gentleman, valued at . .	2	0	4½
On Turnips—2 cwt. gave an increase to Mr. Hannam of 4 tons 9 cwt., worth .	2	4	6
On Barley—2 cwt. gave to the same gentleman an increase of 15 bushels, worth	2	16	3
Giving an increase on the rotation of	£10	18	4½

Produced by the application of 8 cwt. of guano; and as 1 ton of Peruvian guano can be bought for 10*l.*, the farmer, at this rate of increase, will get 27*l.* 16*s.* for his 10*l.* worth of guano. In an estimate of this kind we can, of course, only make an approximation to the truth, but if these data are tolerably accurate, they appear conclusive of the superior economical value, to the farmer, of guano. Nor is this all; for the increased produce of one year adds to the manure-heap for the next. I think it is of importance that correct notions should be entertained on matters like this; as the application of specific manures will, probably, be greatly extended by the assistance of science, and will, indeed, be the chief triumph of modern agriculture. The immense traffic in guano last year attests the good opinion entertained of its qualities, and though, for my part, I do not at all join in the fear of famine apprehended by many, yet I have no doubt whatever that the extensive use of guano and other direct foreign manures, has had a material influence in averting that calamity.—*James Caird, Baldoon, Wigtown; Nov.* 26.

Discussion on Flax Culture at Ballinasloe.—In the *Agricultural Gazette* of the 22d November, p. 791, is a letter from Mr. J. H. Dickson, on the Discussion on Flax Culture at Ballinasloe, in which my name is treated in a very unceremonious manner. Fair criticism, no author who writes for the public, has a right to complain of; but misrepresentations are unfair to every author. I am willing to believe that the misrepresentations of Mr. Dickson are not wilful, and yet he does not quote correctly from your Number at p. 744, to which he refers, and these quotations again are not accurately and fairly given from my book. As he, however, seems to write in earnest, I am also willing to believe him when he says that "I have not read the 'Book of the Farm,'" and I dare say he thinks the book the production of a mere theorist, and that I am a creature of "theoretical delusion." Now what I would suggest to Mr. Dickson is this, to read my book, at least what is said in it on the subject which has given rise to his remarks, and to ascertain whether my sentiments on the effects of the growth of Flax on the soil are in accordance with the sentiments and experience of Scottish farmers on that subject. If he do this, and afterwards adhere to the sentiments he has expressed towards me, both in the letter and the spirit, then I shall respect the position he has honestly taken up. And I also suggest that should Mr. Dickson be in Edinburgh ere long, he will favour me with a call, and judge for himself whether he or I know most of practical agriculture. Should he refuse to do either, then I must protest against his presumption in publicly criticising, in a rude manner, the works of a writer he has never read. Before concluding, it is necessary that I correct a typographical error which appears in my book. In mentioning the price of dressed Flax the error consists in saying 6*l.* per ton, whereas the price should have been 6*l.* per cwt., or 120*l.* per ton, the highest price usually given for Flax. This error is very obvious, for only a short way above I had stated the ordinary price of good Flax at 90*l.* per ton. I should also mention that the facts adduced by me are all derived from Scottish practice, and the amounts of produce derived are all given in imperial measures; but I presume that the quantities referred to by the Irish gentlemen are by the Irish acre, or perhaps the Cunningham acre.—*Henry Stephens, Redbrae Cottage, Edinburgh, Nov.* 25.

Top-dressing.—I have been so much pleased with the observations of "Oxygen," in the *Agricultural Gazette* of the 8th ult., that I should feel extremely obliged if he would kindly tell me how he would advise me to prepare some land for Carrots and Oats for sowing next spring. The last crop was Potatoes. When they were dug, I had the land thoroughly well cleaned and forked over to the depth of about 10 inches. It was double spitted before the Potatoes were planted. The soil is a light sand. The custom here is to dig in the manure before the Carrots are sown. But from the observations of "Oxygen," I feel strongly disposed to spread the manure on the land at once, and hoe in the Carrot-seed in the spring.—*John Lowder, Parsonage, Studley, Calne, Wilts.*

The Air-Churn.—My attention has been called to a paragraph in your Paper of the 8th inst. (copied from the *Globe*), relative to an air-churn, stated to be the invention of the Bishop of Derry. Being myself the inventor, I wrote to his lordship, and annex you a copy of his reply:—

(Copy.) "*Broom-hill, Derry, Nov.* 15.

"Sir,—I have this day received your letter, and lose no time in informing you that the paragraph in the *Globe* newspaper, to which you alluded, had no foundation whatever in truth; how it came to be inserted in that journal I cannot understand, as I am utterly ignorant of everything connected with the structure of such a machine as described.—I remain, your faithful servant, (signed) R. Derry."

"To Mr. Alexander Weston, Liverpool."

For your information I beg further to inform you that my churn was registered in September, 1844, and was exhibited (though not entered for competition) at Glasgow in 1844, and particularly recommended by J. Smith, Esq., of Deanston, and several other noblemen and gentlemen. I have this year exhibited it only at Liverpool Agricultural Society, where it received the silver medal, and was particularly commended by the judges in their report. As I am manufacturing them at present, and am dependant upon my exertions as a mechanic, I beg you will do me the justice of inserting this.—*Alex. Weston, Liverpool.*

Capital Needed in Farming.—I have been much amused with the modest and diffident letter of "J. S., Bromston," in the *Chronicle* of the 22d of Nov.; it puts me in mind of a fable I used to read in my youth, of the wolf and the lamb, who were quenching their thirst at the same rivulet: and although the wolf was standing much higher up the stream than the lamb, he accused the latter of muddying the stream which flowed towards him. I must be permitted to make one extract from the able letter of "J. S," viz., "Happily for me I am so situated as neither to see, feel, or know, but little of the evils on which he expatiates." A clear acknowledgment of "J. S.'s" utter ignorance of what he is writing about, which is not difficult to gather from his erudite effusion. In my communications to your Paper I endeavour to be as concise as possible, not wishing to occupy more space than is necessary to make myself intelligible. "None are so blind as those that will not see, none are so deaf as those that will not hear;" and having some individuals of this description to deal with, I must be a little more diffuse, and recur again to a subject so interesting and important as farming, not merely as a *meum* and *teum* affair between landlord and tenant, but in a national point of view. At present I will content myself by simply asking the following questions:—Is it a proof of extreme folly and wilful malice to urge agriculturists to employ capital in the cultivation of land? Is it unfair to tell a farmer that if he holds a greater number of acres than he can properly manage, he runs a great chance of being ruined himself, and of defrauding his landlord? Is it symptomatic of a bad spirit to show the value of saving manure in the most economical way? Is it ill-natured hinting to a farmer the certainty of adding to his own comforts and his neighbours, by judiciously employing extra labour? Is it contrary to the spirit of charity to affirm that all ill drained and weedy land is comparatively unproductive? Is it unneighbourly to caution a man against wasting his substance? Is it unfriendly to guard the farmer against those who would persuade him to go on in the old careless manner of tilling the soil? Is it unwise to plead the working farmers' cause with agricultural associations? Is it contrary to fair dealing to suggest that stall feeding enables the farmer, in many instances, to convert fallows into profitable arable? If the above questions can be answered in the affirmative, I have certainly very much mistaken the use of the English language, and should feel obliged by being referred to the dictionary consulted by "J. S., Bromston." I have not yet done with capital, neglect, &c.; however, I will for a time rest on my oars. Perhaps some of your correspondents will kindly answer the following questions: 1. What were the average wages during October, November, and December, 1844; and during January, February, and March, 1845, amongst agricultural labourers in Oxfordshire, Buckinghamshire, Berkshire, and Gloucestershire; and was there a sufficiency of work? 2. What rent did the labourers pay for cottages? 3. How were they off for fuel? I can, of my own knowledge, speak to some of the points in question, but my motives having been traduced, I should wish to have other evidence of the facts. Perhaps I may be able to enlist the clergy in the service. P.S. It shows great weakness when a man perverts truth to serve his own purposes. With regard to boiling salt and water, I did not recommend it as a remedy, but proposed the trial as an experiment to destroy the fungi in the diseased Potatoes. I tried it myself as soon as possible, and found it did not kill the fungi, when I immediately wrote to the *Chronicle*, mentioning the failure. This occurred many weeks ago, and not having observed the insertion of my note, I imagined the Editor did not consider it of any consequence.—*Falcon.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House in Hanover-square on Wednesday last, the 3d of December; present, the Rt. Hon. Lord Portman, President, in the Chair; his Grace the Duke of Richmond; T. R. Barker, Esq.; S. Bennett, Esq.; W. R. Brown, Esq.; F. Burke, Esq.; F. C. Cherry, Esq.; W. A. Cherry, Esq.; J. W. Childers, Esq., M.P.; H. Gibbs, Esq.; B. T. B. Gibbs, Esq.; C. Hillyard, Esq.; W. Fisher Hobbs, Esq.; J. Kinder, Esq.; J. Parkes, Esq.; F. Pym, Esq.; Prof. Sewell; J. V. Shelley, Esq.; W. Shaw, Esq.; Prof. Solly; C. H. Turner, Esq.; T. Turner, Esq.; and H. Wilson, Esq.

The following new members were elected:—

Swaine, Thomas, Buckingham
Bull, Humphrey, Aston-Clinton, Tring, Herts
Batard, Thos. Matthias Bearda, Sydenham, Kent
Greenhow, John, Kendal, Westmoreland
Marshall, John, Alnham, Whittingham, Alnwick, Northumb.
Dyke, Henry, Papade, Monmouth
Howard, John, Brereton Hall, Sandbach, Cheshire
Fox, Robert, The Lodge, Wendover, Bucks
Henderson, Edward, Lowick, Wooller, Northumberland
Wickham, John, Butcombe, Bruton, Somerset
Allen, James, Holt Farm, Pilton, Shepton-Mallet, Somerset
Elgar, James, Wingham, Kent
Rathbone, Basil, Woodcroft, Liverpool
Walker, George, Eastwood, Nottingham
Naish, W. B., Stone-Aston, Bath
Mason, Thomas, Fallinsburn Cottage, Ford, Wooller, North.
Wells, John, Woodborough, Nottingham
Majendie, Ashhurst, F. R. S., Hedingham Castle, Halstead
Howard, Hon. James, Hazelby, Newbury, Berks
Watts, James, Hythe, Kent
Bagot, Hon. William, Blithefield, Rugely, Staffordshire
Pope, Thomas, Kidbrook, Blackheath, Kent
Wilkinson, William, Stainton Vale, Richmond, Yorkshire
Hearn, John Henry, Newport, Isle of Wight

The names of 41 candidates for election at the next meeting were then read.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committe, laid before the Council the monthly statement of the accounts of the Society, when it appeared that the amount of invested capital stood at 8200*l.*, and the current cash balance in the hands of the bankers at 242*l.* The Chairman also laid before the Council a balance-sheet made up to that day of the Shrewsbury meeting account, showing the total receipts (including the subscription of 1000*l.* from the town of Shrewsbury) as amounting to 3661*l.* 12*s.* 2*d.*, and the total payments to 5166*l.* 8*s.* 9*d.*, leaving an excess of payments over receipts on that account of 1504*l.* 16*s.* 7*d.* chargeable on the general funds of the Society. The Chairman stated, that as there were still, however, a few unsettled accounts connected with the Shrewsbury Meeting, the balance-sheet then presented was incomplete accordingly, and not finally closed.—Mr. Barker also presented, on the part of the House Committee, their monthly report of proceedings, which, along with that of the Finance Committee, was adopted.

Prize-Essay.—Mr. Pusey, M.P., Chairman of the Journal Committee, reported to the Council the award of the Society's Prize of 20*l.* for the best Essay on Catch-meadows, to Mr. John Roals, of Wiveliscombe, Somersetshire.

Selected Wheat.—Earl Spencer transmitted to the Council his detailed Report on the Comparative Trial of the Cultivation of the Wheat selected at the Southampton Meeting, along with other varieties grown in the neighbourhood of Northampton. The consideration of this report was deferred until the other reports on this subject have been received.

December Meeting.—The President reported that Dr. Lyon Playfair had kindly consented to deliver two lectures on the Potato Disease, before the members, on the occasion of their ensuing General Meeting, at noon o'clock in each of the evenings of Wednesday, the 10th and Thursday, the 11th inst. The President further reported, that the Royal Institution of Great Britain had liberally granted the use of their Theatre, in Albemarle-street, Piccadilly, for the delivery of these lectures: the members of the Society obtaining as formerly their free tickets of admission on application to the Secretary, at 12, Hanover-square.—A Report from Mr. Pusey, M.P., Chairman of the Journal Committee, was then read, stating, that as Dr. Lyon Playfair had acceded to the President's request to deliver lectures to the Society on the Potato Disease, the communications from members on that subject had been transferred to him for examination.—The Council ordered the Rooms of the Society in Hanover-square to be thrown open for the accommodation of members from six to ten o'clock on the evenings of Wednesday, Thursday, and Friday next: the General Meeting being held on Saturday, the 13th inst., at 11 o'clock in the forenoon.

Committees.—The Council then proceeded agreeably with the bye-laws to re-appoint the Standing Committees for the ensuing year: adding the names of Mr. Pym and Mr. Jonas to the list of the Finance Committee, and those of the late and present Mayor of Newcastle-on-Tyne to that of the General Newcastle Committee.

Annual Prize-Sheet.—On the motion of Mr Raymond Barker, seconded by Mr. Gibbs, it was resolved, "That in future the Prize-sheet for the Country Meeting should be finally settled at a Special Council to be held on the Thursday of the Smithfield Club week in

December, instead of at one held as formerly in the month of June, in the year preceding."

AUCTIONEER AND ENGINEER.—On the motion of Mr. GIBBS, the following Resolutions were agreed to:—

1. That the auctioneer or his clerk shall be in attendance in an office in the show-yard from 10 o'clock, A.M., until 4 o'clock, P.M., on the Thursday of the show week, for the purpose of receiving instructions from such exhibitors as may have properly entered stock or implements for sale at the auction.
2. That the auctioneer shall receive all the forfeit money for the withdrawal of stock or implements from the auction, and give the exhibitor the necessary countersigned order for the removal of such stock or implements from the yard.
3. That the auctioneer shall take charge of, and sell the catalogues of the sale, and that he shall deliver over to the director for the Society's use the money arising from the forfeits and the sale catalogues.
4. That the consulting engineer shall not act as one of the judges of implements, but only act as mechanical referee, in case the judges may deem it necessary to call in his aid.
5. That the consulting engineer shall be in attendance in the yard, and during the trials to examine the implements.

NORTHUMBERLAND PRIZES.—The PRESIDENT read to the Council a letter addressed to him by the Duke of Northumberland, in which His Grace expressed his approval of the proposed arrangement by the Council for the distribution of the premiums which he had placed at their disposal.

The President having laid before the Council numerous communications he had received for the Journal Committee on the Potato disease, and other subjects, the Council ordered that a collector of subscriptions on the part of the Society should be directed to attend, as usual, at the office of the Smithfield Club for the convenience of those members who visited the Show during the ensuing week; and referred the appointment of an auctioneer for the Country Meeting of next year to the General Newcastle Committee.

IMPLEMENT PRIZES.—His Grace the Duke of RICHMOND, at the request of the President, then took the chair, and the Council proceeded to a consideration of the distribution of the 300*l.* voted in June last for Implement Prizes at the Newcastle Meeting. On the motion of Mr. SHELLEY, the following schedule was unanimously agreed to:—

For the Plough best adapted to heavy land	£10
For the Plough best adapted to light land	10
For the best Drill for general purposes, which shall possess the most approved method of distributing compost or other manures in a moist or dry state, quantity being especially considered. N.B.—Other qualities being equal, the preference will be given to the drill which may be best adapted to cover the manure with soil before the seed is deposited	15
For the best Turnip Drill on the flat, which shall possess the most approved method of distributing compost or other manures in a moist or dry state, quantity being especially considered. N.B.—Other qualities being equal, the preference will be given to the drill which may be best adapted to cover the manure with soil before the seed is deposited	10
For the best Turnip Drill on the ridge, which shall possess the most approved method of Distributing Compost or other manures in a moist or dry state, quantity being especially considered. N.B.—Other qualities being equal, the preference will be given to the Drill which may be best adapted to cover the manure with soil before the seed is deposited	10
For the best Scarifier	10
For the best Chaff-cutter	10
For the best Machine for making draining-tiles or pipes for agricultural purposes. Specimens of the tiles or pipes to be shown in the yard; the price at which they have been sold to be taken into consideration, and proof of the working of the machine to be given to the satisfaction of the judges	20
For the best Harrow	5
For the best Drill-presser depositing manure and seed	10
For the best Churn	5
For the best Weighing Machine for live cattle and farm produce generally	10
For the best Steaming Apparatus for roots	5
For the best Skim or Paring Plough	5
For the best Subsoil Pulverizer	10
For the best Horse-seed Dibbler	15
For the best Hand-seed Dibbler	5
For the best Linseed Crusher	5
For the best One-horse Cart	5
For the best Thrashing-machine	25
For the best and most economical Set of Tools and Instruments for Draining purposes	10
For the best Steam-power, applicable to Thrashing, or other Agricultural purposes	25
For the best Horse-power, ditto, ditto	25

The Council ordered that it should be distinctly stated, among the Regulations of the Implement Prize-Sheet, that each exhibitor shall be bound to execute all orders given to him in the Show-yard, at the price stated in his certificate.

LIST OF MEMBERS.—On the motion of Mr. FISHER HOBBS, the Council ordered that the List of Members of the Society should be printed immediately after Christmas.

NOTICES OF MOTION: FINANCIAL RETURNS.—Mr. HUMPHREY GIBBS gave notice that he should move at the next monthly Council—

That the Finance Committee shall in future cause to be prepared a monthly account of the state of the Society's finances, showing on the Dr. side, first, the ordinary payments that have been made, such as rent, taxes, salaries, printing of journal, prizes annually given, expenses of the annual show, &c., and secondly, the amount of ordinary debts that may remain due from the Society. Thirdly, the extraordinary payments that have been made, such as the repairs of the house, purchase of printed books, furniture, &c., and fourthly, the amount of extraordinary debts that may remain due from the Society. On the Cr. side, first the amount of arrears received of annual subscriptions for each previous year respectively. Secondly, the amount of annual subscriptions for the current year. Thirdly, the sums received for the sale of Journal, money taken at the annual shows, and other ordinary sources of income. Fourthly, as extraordinary receipts, the amount of such compositions as may have been received in lieu of the annual subscriptions; and, fifthly, any other monies that may have been received and cannot be considered as ordinary sources of income.

That the Finance Committee shall cause to be laid before the Council as ordinary debts due at the same periods, a detailed account of the arrears due to the Society for the annual subscriptions, showing the amounts due from each year respectively, and also the amount of the annual subscription due for the current year; also as extraordinary debts due to the Society on account of the amounts due for compositions.

Also a statement of the funded property, together with a memorandum of the amount of monies received as compositions, but which has not been funded.

That the report above alluded to shall be for the month previous to the one at the meeting in which the statement is to be made; for instance, the account to be laid before the Council at its meeting in January next shall comprehend the month beginning the first Wednesday in November and ending the first Wednesday in December, so as to give the Committee full time to collect and digest the materials for the report.

The Council then adjourned to Wednesday next, the 10th of December.

Farmers' Clubs.

SUSSEX: *Turnip and Root Show.*—At the late meeting of this Society, the following letter was read from Sir C. M. Burrell, Bart.—"Knepp Castle, Nov., 1845—Sir, in compliance with your request, I send you specimens of my White Cattle Carrots, of which you will perceive the abundant and valuable produce annexed in the postscript, justifies in every respect the favourable opinion I have hitherto expressed, while it offers proof of the soundness of the system of cultivation I have ventured, on practice, to recommend, not only for their more certain growth, but as leading to a greatly increased produce. I allude to the selection of land free by nature, and the introduction of good and abundant under-drainage at such depth (from two to three feet) as may best suit the nature of the soil, observing that according to the depth selected, should the drains be nearer or further apart according to my view of that question, fully agreeing as I do in opinion with that represented to have been publicly expressed by Mr. Smith, of Deanton, that to drain deeper than three feet is to incur an useless expense, unless under some peculiar circumstances, needless for me as a cultivator of Sussex clay land to enter into. Suffice it to say, that the beneficial effects of the Pearson plough drainage upon above 800 acres of clay subsoil, in no respect diminished after 12 years' experience of this cheap, and, as I believe, permanent under-drainage, executed at from 24 and 26 inches for the plough drains, and three feet depth for the tiled main drains and the outfalls, leaves me nothing to regret as respects under-drainage wholly with drain-tiles of any description; inasmuch as from a former average produce of one load of Wheat in the sheaves per acre, two have since been carried, embracing a fine sample of Wheat, while Clover has been more productive, as well as Oats, and Barley previously unfit for malting, has perfectly stood the test this year, and has been applied with success for brewing the annual stock of malt liquor. To return, however, to the main object of this letter, the raising of succulent food for cattle, after observing that my Swede Turnips have proved abundant and of good size, I proceed to particularise my preparation for White Carrots; the ground is trenched and well pulverised by the spade, two spits deep in December, before the usual period of severe frosts, and being well under-drained, the filtration through the trenched soil is rapid, and the action of subsequent frost tends to make the ground mellow, and particularly suitable for drilling in the Carrot-seed in April. When the plants grow of sufficient height, they are set out with the hoe carefully at about the same distance as Swede Turnips, and the repetition of hoeing will depend much on the season, whether the seeds come up altogether or not. If any dressing is necessary from the crops which have preceded, and of which the occupier is the best judge, I am disposed to recommend a slight top-dressing of guano mixed with free earth well pulverised, or any other suitable top-dressing while the plants are young, to be applied during mild and moderately rainy weather; and during their progress to maturity, pulling up for the use of stock any plants which begin prematurely to run to seed, sedulously keeping hares, and more especially rabbits, down as low as possible, or they will injure the Carrots greatly, coming from a greater distance than may be suspected; but flying game has not been found to injure them at all. In concluding my reply, I cannot lose the opportunity of repeating the entire satisfaction derived from Mr. Warnes's (of Trimingham), box-feeding system as set forth in his pamphlets, and brought into both summer and winter practice on my farm, the beasts thriving rapidly on the compound mode of crushed Linseed with Bean, Barley, or other meal boiled and formed into a mass, and with which my beasts have thriven more advantageously than others on oil-cake, and at less cost; and as regards the excellence and flavour of the meat, it is superior, and especially tender and juicy. And if further proof were desirable, it is afforded in their ready sale to neighbouring butchers, and in the intended increase early in the spring of the number of my cattle boxes, from 13 to 30, from the roofs of which the rain-water will be saved in one or more spacious tanks arched over, similar to one which wholly supplies my hot and greenhouses. With respect to particular statements of comparative cost in feeding on Mr. Warnes's system, it seems to me prudent to state no corrected calculations until I have completed two years' trial. Suffice it now, however, to add that I have sound grounds for preferring the box-feeding system to every other mode; the food being cheaper, the cattle thriving faster, and the dung made being so much better, that we consider 12 loads thereof equal to 20 loads from oil-cake and beasts in yard, whether tied up or otherwise. Moreover, the very recent date of your letter precludes the making accurate calculations. Hoping that what I have stated will be plain and satisfactory, I remain, Sir, your obedient servant, CHARLES MERRIK BURRELL.

P.S.—I am now enabled from the measurements made by my workmen of three rods of White Carrots taken in different spots, the Carrots of which, without green tops, averaged 4cwts. 9lbs. to the rod, calculating whereby, the amount of the crop will amount to 32 tons 12cwts. 3qrs. 12lbs. per acre, and which, as far as can be judged from the progress made in raising the crop up to Saturday night, will be the average produce per acre of the field; naturally a wet sticky soil, but improved by the Pearson drainage; subsoiling and trenching for the White Carrot crop."—*Sussex Express.*

WITHAM: *Annual Meeting, Oct.* 9.—Mr. Mechi stated that in one of his fields at Tiptree, in preparation for Wheat he applied tank manure solid and liquid together, and on another piece he applied liquid manure alone from the same tank, at the rate of 1500 gallons per acre. During the winter the crop on the portion subjected to the latter treatment looked yellow and unpromising, but as the spring advanced it went on well, and he found no perceptible difference in the crop, the yield being 5½ quarters per acre. He mentioned this fact because there had been an impression that liquid manure was not valuable, but in this instance it proved fully equal to solid, applied at the rate of 15 cart-loads to the acre against 1500 gallons of liquid. Another fact he would mention was, that he subsoiled some heavy land for Beans. Of course the subsoil was of bad quality. It was said that it would be absurd to sow upon that, but the result was that he had a better and stronger plant there than on other portions, though he could not at present state the difference in quantity. He had no hesitation in stating it as his opinion, and also that of persons in the low lands of Scotland and in Lincolnshire, that the agriculture of Essex, however perfect in other respects was deficient in three points—namely, deep drainage of strong lands, economy of manure, and economy of time in suitable farm-buildings. It was his belief that water would percolate through strong soils, but there was a general feeling in Essex to the contrary, but it had been found to percolate to a depth of 2 ft. 8 in., and it would do so at 4 ft. and 5 ft. He had endeavoured to stimulate inquiry into this subject, and he should feel obliged if, to gratify himself and them, they would try on their strong clays, where they could get a sufficient fall, the 4 ft., 5ft., or 6 ft. drainage. Mr. M. then further alluded to the results of his experiments with liquid and solid manure, and remarked that in one field so treated, the soil of which was second or third-rate, he raised 4½ quarters of Wheat per acre, which he sold at 59*s.* It was his intention to go on draining deep, and should continue to spread his tank manure, having witnessed the satisfactory results of the plan.—Mr. William Hutley said, after the observations of Mr. Mechi, as to the draining of heavy lands, he should be very happy for that gentleman to try the experiment on his farm, and he would pay the expense of it if it suited his purpose. He should drain it 5 ft. deep, and he (Mr. H.), would take another field without draining, and all that Mr. Mechi could grow above the produce of the other field he might have for his trouble. Mr. Mechi had spoken of the price his Wheat fetched, 59*s.*; why, upon this watery land he had grown Wheat and sold it for 68*s.* His (Mr. Hutley's) opinion was, that it was of no use whatever to drain on heavy lands, as he did not believe the water would percolate.—Mr. Mechi: I'll prove it on your land.—Mr. Hutley: When Mr. Smith was there he engaged to do it, but he had not been yet forthcoming; but he had no doubt Mr. Mechi would keep his promise. He had said that this land might be made most fruitful; he (Mr. H.), could only say that it had already produced five quarters of Wheat per acre, and 10 quarters of Oats; and he would ask Mr. Mechi, taking the whole body of the land, did he think that by draining there would be more produce raised.—Mr. Mechi: I think there would. Mr. Hutley: I'll give Mr. Mechi from 5 to 20 acres to drain.—Mr. Mechi: I'll take two acres for the experiment.—Mr. Hutley was satisfied it would not answer as there was not a stratum of different soil; it was all of a strong texture.—Mr. Mechi inquired if it cracked in dry weather?—Mr. Hutley: Yes, big enough to put your legs in. (Laughter.)—Mr. Mechi: then it can be drained in wet weather.—Mr. Hutley said apart from all joking, he must say that Mr. Mechi had been a valuable person in that neighbourhood. He went to Tiptree and saw a man digging away at a drain, and he said he should not have a bellyful of victuals if it was not for Mr. Mechi. Then he (Mr. H.) said "Hurrah for Mr. Mechi! he has done good in encouraging the labourers, and he is the best man Tiptree-heath ever produced." He hoped he would proved successful in his experiments. If his plans were bad, still he had done good in setting men to think, and communicating with them on the matter; but he thought he had gone on a little too fast, for when he had said that he had laid out 800*l.* or 900*l.* more than he ought, it was necessary for persons to calculate upon what they would get for the experiments. He thought as far as trying experiments went, they ought to be much obliged to Mr. Mechi.—Mr. Mechi said, the question of deep draining was one far too important to be decided upon by opinion. It was of great importance to Essex, because they knew that many persons had suffered from the slug, and other consequences of a wet season.—Mr. Hutley said, it might answer upon Mr. Mechi's soil, but let him try the heavy lands of Wigborough.—Mr. Mechi wished to know whether a 5-feet drainage had ever been tried on heavy lands and failed. Could Mr. Hutley say that his land was ever dry at any depth below the surface?—Mr. Hutley: It is never dry, and you cannot make it

so. He could bring soil two feet below the surface, which after two months drought would be wet.—Mr. Mechi said he would mention an anecdote upon this subject. A friend of his named Spencer was draining a field 4 ft. deep; a gentleman who inspected the work inquired why such a plan was adopted to get rid of the surface-water. The man at work asked him whether, when he tapped a cask of beer he did so at the bottom or the top. Of course the gentlemen replied at the bottom. And where is it dry first rejoined the man. Why at the top was the answer. (Laughter.) The result of this system was, that the water left the top and passed off through the drain. That was what was taking place at Tiptree after these heavy rains. He wished to remove the strong prejudices which existed against the system of drainage, being certain it would be a benefit to the country at large. It must be settled by facts, and as far as he was concerned he would prove it by test and trial. Another point of importance in Essex was the timber and fences. He was certain there was more land taken up and more time lost in watching and repairing them as would produce as much corn as we required from foreigners, and leave a balance for exportation. Another point was the necessity of having suitable buildings for carrying on the operations of the farm. If he were asked the comparative value of buildings per acre, and that of land, in his opinion, in the economy of fatting stock, obtaining the manure in proper tanks, and the saving of time in thrashing, it would make a difference of from 15*s.* to 20*s.* per acre more to be paid; and that was the reason why he had erected good buildings. With reference to thin sowing he would state the fact, that on the 15th of April he sowed one peck of Barley on half an acre, and the produce was two quarters.—Mr. R. W. Dixon remarked with reference to thick and thin sowing, that in 1834 he had a field of Wheat sown at the rate of eight pecks per acre, and directed his man to put six pecks upon two stetches. It was a good season for Wheat that year, and though the appearance of the thickly-sown plants was not at first favourable, yet it proved the best crop by a yield of two or three bushels more. He had since that time sown rather thickly. He could not speak of any other test than that of Beans. The average sowing in 1841 was 5½ bushels per acre drilled in rows 2 ft. apart. It was a good Bean year. The test was tried in one field, and two stetches were sown with 6½ bushels, and upon thrashing the produce the yield of the portion sown with the 5½ bushels was 9 qrs., 2 bush., and that of the 6½ bushels, 9 qrs. 7 bushels.—The President inquired of Mr. Dixon what quantity of seed Wheat he sowed per acre?—Mr. Dixon replied that on an average if he got it in early, he used three bushels; he thought the most productive description was the large berried seed.

Miscellaneous.

Rotation of Crops.—It is better to prevent the special exhaustion we have been speaking of than to cure it. It is often difficult to discover what the land really requires, and, therefore, to cure the evil when it exists. The only method of preventing it with which we are yet acquainted, is by the introduction of a skilful rotation or alternation of unlike crops. In adopting such a rotation, we only copy from nature. In the wide forest, many generations of broad-leaved trees live and die, and succeed each other; but the time comes at last when a general pestilence seems to assail them all; their tops droop and wither, their branches fall off, their trunks rot. They die out, and a narrow-leaved race succeeds them. This race again has its life, of centuries perhaps; but death siezes it too, and the expanded leaf of the Beech, the Ash, and the Oak, again cheer the eye—playing with the passing zephyrs and glittering in the sun. So in the broad meadow, the old pasture changes, and new races of humble Grasses succeed each other as the fields increase in age. The alternation of crops, therefore, asserts to itself something of the dignity of a natural law, and man is evidently in the right course when he imitates nature in a procedure like this. But upon what do its good effects depend? Why do the broad leaves alternate with the narrow in the ancient forest? Why do the Grasses change in the old meadow? Why does the farmer obtain a larger produce, and for a greater number of years, by growing unlike crops alternately, than by continuing year after year to grow the same? The reason is not merely that one crop carries off more, and another crop less, of all those things which all our crops derive from the soil, but that one crop carries off more of one thing, another crop more of another. The grain carries off phosphorus, the straw silica, the bulb alkaline matter. After, perhaps, 15 or 20 successive crops of the same kind, the surface soil through which the roots are spread become so poor in those substances which the crop especially requires, that the plant cannot obtain from it a sufficient supply to nourish and bring to maturity the full-grown plant, within the time allotted to it in our climate for its natural growth. The roots do their best; they collect as diligently as they can, but winter comes on, and the growth ends before the plant is fully matured. In the case of corn, the first effect of a scarcity, say of phosphoric acid, is to make the ear smaller and the number of grains less; the next to continue the growth into the winter, and only when a very fine season occurs to ripen the ear at all. But suppose we alternate the corn crop, which in its grain carries off phosphoric acid, with a hay crop which requires much silica, or a root crop to which much alkaline matter is necessary—then the one crop would live upon and remove what the other had left in greater abundance. Instead of robbing the soil every year of the same substances, we should be exhausting it more equably of all, and we should be able, for double the time at least, to crop it without the risk of its ceasing entirely to give us a profitable return. We should gradually work up also every available substance in the soil, whether such as are naturally present in it, or such as we have ourselves added in the form of manure. What is true of the simple alternation of a corn with a green crop, is more true still of a longer and more complicated rotation. The greater the variety of crops we grow, and the longer the interval between the successive crops of the same kind, the more perfectly do we avail ourselves of the benefits which an obedience to the suggestions of this principle is fitted to confer upon us. No rotation, it is true, however skilful, will alone prevent the land from becoming ultimately exhausted. Nothing but regular and generous manuring will do this, unless there be, in springs from beneath, or in the decaying fragments of rock mixed with the soil, or in substances brought down from higher grounds, or in the nature of the rains that fall upon the land, some perennial source of these substances which the crops always carry off from the soil. But in a skilful rotation there is this virtue, that land which is subjected to it cannot be ruined in so short a time. If one tenant use it ill, it may come into the hands of another before the ruin is so far irremediable that the farmer who has a rent to pay cannot reclaim it with a prospect of immediate profit to himself.—*North British Review.*

Notices to Correspondents.

Butter—*P T O*—Milk should yield a quarter of a pound per gallon.——*Phosphorus*—You may use Mangold Wurzel, Carrots, hay, oil-cake, but not Turnips or Swedes, if you wish a good-flavoured butter. Give your cows 6 to 10 lbs of hay a day, and about a cwt. of roots. You may use phosphorus balls, made as recommended, with safety.

Churning—*A Sub.*—Will any one kindly give us their experience of the churn manufactured by Robinson, of Lisburn.

Dragging Cart Wheels—*A Subscriber*—This is done either by shoe or chain (the latter is now objected to in many districts by road trustees); in some places, road trustees place at great descents a sort of dragging chair (half-supported on wheels) on which the cart-wheel rests, the return cart always taking it up to the top of the hill again for use another time. Perhaps the best contrivance, however, is one in which the horse himself in the act of backing presses a drag against the nave of the wheel and renders its motion difficult. Mr. Clyburn, of Uley, Gloucestershire, will give you information on this point,

Drains—*P L P*—Will any one tell us where, and by whom, and at what cost, various sizes of drain-tiles may be shipped at London?——*R W*—It is the worse for them if they slope too much. If the slope is steep, carry the drains obliquely up it, giving them say 4 feet fall in 100, and let them run into a main as usual at the bottom.

Feeding—*Inquirer*—Your two-year old bull should be castrated. It *will* make a difference in the beef.

Feeding Lambs—*Inquirer*—Give the oil-cake to the *ewes*; half or three-quarters of a lb. each daily.

Fences—*Inquirer*—You may safely follow Mr. Grigor's advice.

Levelling Pastures—*K R*—You had better strip, first the turf, and then a few inches of the top soil, off each hillock and adjoining hollow; then level the subsoil and replace the soil and the turf.

Mixture for top-dressing Wheat—*G A P*—Guano will probably pay best. Salt and lime and sulphate of ammonia must not be mixed together; the lime will drive off the ammonia. Nitrate of soda is a good thing to apply to Wheat.

Old Pasture—*S S S*—Oats will be your best crop. They will stand better than Wheat.

Peat Drain Tiles—*James Russell*—They are made simply by cutting them from the bog with a spade of the proper form. When dry, these peats are ready for use.

Potatoes—*Isle of Man*—If you boil your Potatoes, or steam them, and mix 2 lbs. of salt with each bushel of Potatoes, your cows will eat them with advantage. You must not give them raw. We have mentioned this two or three times already.

Sheep-nets—*Inquirer*—"How can hares and rabbits be prevented cutting them?"

Stall Feeding—*R W*—A house 10 feet square, with an opening 4 feet wide, opening into a little yard of the same width and 12 or 15 feet long, will answer for your cow very well. The flooring may be of brick or stone paving, with a gutter through it conducting to a tank holding about 80 cubic feet, *i. e.*, 4 feet deep and 5 feet square in surface. The cow may be fed on Carrots or Parsnips and hay, putting a little of each in separate cribs before her at a time, and always renewing both when she has finished. She will eat probably from 6 to 10 lbs. of hay, and from 100 to 140 lbs. of roots, according to her size.

Tanks—*A B H*—As to form, square-made tanks will be cheapest. Build them of brick, *roman* cemented, and paved at bottom. A tank large enough to hold the urine (undiluted by rain water) of 12 horses, 8 cows, 10 feeding cattle, 20 young stock, and 10 pigs, for say 100 days (and you can surely empty it once in that time) needs to be 10 feet deep, 10 feet wide, and 15 feet long.

*** As usual, many communications have arrived too late.

Markets.

SMITHFIELD, Monday, Dec. 1.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	4s	0 to 4s	4	Best Downs & Half-breds	4s 8 to 5s 0
Best Short Horns	3	10 to 4	2	Best Long-wools	4 6 to 4 8
Second quality Beasts	3	0 to 3	6	Ewes and second quality	4 2 to 4 6
Calves	4	0 to 5	0	Pigs	3 8 to 5 0

Beasts, 3814; Sheep, 23,310; Calves, 58; Pigs, 406.

We have to-day a very good show of Beasts; several from the western counties of very superior quality, many of which remain unsold, being too big for the trade. The selling qualities have gone off, although slowly, at quite late quotations.—The supply of Sheep is very small, but trade is dull, without any material alteration in price.—Good Veal continues to sell well —Good Pigs are in demand.

Friday, Dec. 5.

The supply of Beef is good, and trade dull; the best Scots, &c., barely make 4s 4d, and best Short-horns very little over 4s. Very little is doing in the second qualities, and several remain unsold.—There are rather more Sheep to-day, and the demand is limited; best Downs will make about 5s, and the best Long-wools nearly 4s 8d, but Ewes and second qualities are decidedly lower, making from 4s to 4s 4d.—Good Veal is scarce; a very choice Calf makes 5s 4d, but second quality is no dearer.—Nice small Porkers 4s 8d to 5s 4d; large Hogs 3s 8d to 4s 4d.

Beasts, 855; Sheep, 2990; Calves, 133; Pigs, 315.

41, West Smithfield.

HAY.—Per Load of 36 Trusses.

Smithfield, Dec. 4.

Prime Mead. Hay	85s to 90s	New Hay	—s to —s	New Clr.	—s to —s		
Infr. New & Rowen	60 70	Clover	85 to 112	Straw	27 32		

John Cooper, Salesman.

Cumberland Market, Dec. 4.

Prime Mead. Hay	88s to 95s	Old Clover	110s to 115s		
Inferior	70 81	Inferior do.	90 105	Straw	32s to 36s
New Hay	— —	New Clover	— —		

Joshua Barns, Hay Salesman.

COVENT GARDEN, Dec. 6—There has been little alteration in the prices of Fruit during the week, and the supply well kept up, except of Pine-apples, which are scarce. Pears are rather more plentiful, and dessert Apples sufficient for the demand; but good sorts for culinary purposes scarce. Hothouse Grapes are scarcer, and rather higher price. Portugal, and other foreign sorts, are abundant; the former are not very good in quality. Oranges have been brought in considerable quantity, and Nuts of all kinds. Walnuts, are plentiful; Cobs are a trifle dearer. The supply of most kinds of Vegetables have not altered much during the week, except Potatoes, which are considerably dearer. Cabbages, Savoys, and Broccoli, are good in quality, and sufficient for the demand—the latter a little dearer—and Brussels Sprouts and other winter greens are abundant. Excellent samples of Carrots and Turnips are in the market. Celery is also good in quality. Cauliflowers are scarcer, and in consequence, dearer. Endive, Lettuces, and other salading, are sufficient for the demand. Cut flowers chiefly consist of Begonia venusta, Euphorbia jacquiniflora, Epiphyllums, Heaths, Acacias, Heliotropes, Cinerarias, Pelargoniums, Camellias, Chinese Primroses, Chrysanthemums, Violets, and Roses.

FRUITS

Pine Apple, per lb., 4s to 6s	Lemons, per dozen, 1s to 2s
Grapes, Hothouse, per lb., 3s to 6s	— per 100, 7s to 16s
— Spanish, per lb., 9d to 1s	Almonds, per peck, 6s
— Portugal, p. lb., 8d to 1s 6d	Sweet Almonds, per lb., 2s 6d to 3s

Cucumbers, each, 6d to 1s	Tarragon, per bunch, 4d
Spinach, per sieve, 9d to 1s 6d	Mint, per bunch, 2d
Leeks, per doz. bunches, 1s to 2s	Marjoram, per bunch, 4d
Garlic, per lb., 6d to 8d	Chervil, per punnet, 2d to 3d
Tomatoes, per hf.-sv., 2s to 4s 6d	

POTATOES.—Southwark, Waterside, Dec. 1.

This market still presents a frightful picture of the prevalency of the disease among the Potatoes; about one-third of the Yorkshire and Scotch Reds that were offered for sale last week were near a total loss, and there were several other cargoes that would barely pay the current expenses. The supply last week was moderate, but fully equalled the demand. This market is likely to be thinly supplied for some time to come, those growers that have diseased Potatoes are afraid to ship on their own account, and no speculator would risk them, and those that have samples tolerably free from the disease are holding them back expecting better prices. The York Regents are generally sound, and there are also some small lots of Whites and Kidneys from Lincolnshire and from the inland counties, also some Buff and Blues from Montrose and Aberdeen, that have arrived in tolerable condition but at present the quantity from those places have been inconsiderable. The above samples are selling as follows:—York Reds, from 10s to 120s per ton; York Regents, 60s to 120s per ton; Scotch Reds, 5s to 8s per ton, Lincolnshire Whites and Kidneys, 80s to 85s per ton; Montrose and Aberdeen Blues, 60s per ton.

MARK-LANE, Monday, Dec. 1.

The supply of Wheat from Essex, Kent, and Suffolk, this morning, was small, and chiefly in very damp condition. Dry samples met a ready sale on the terms of last week, but millers refused to purchase the others, even at a slight decline. The foreign meets a retail demand, also bonded for consumption, but there is nothing doing on speculation, and the value of either is unaltered.—We advance our top quotations for malting Barley 1s. per qr., other sorts are without alteration.—Beans are very unsaleable, although offered at a decline of 2s. per qr.—Good white Peas find buyers at late prices, but inferior qualities cannot be disposed of; Maple and Dun are 2s. per qr. lower.—Having again a large arrival of Oats, and many vessels coming on demurrage, sales have been made at a reduction of 1s. per qr. from this day se'nnight.

British, per Imperial Quarter,	s.	s.		s.	s.
Wheat, Essex, Kent, and Suffolk . . White	58	67	Red .	55	65
—— Norfolk, Lincolnshire, and Yorkshire .	57	65	White	59	67

Peas, White . . . . 50 to 54	Maple	38	41	Grey	34	40

Friday, Dec. 5.

The attendance at market this morning was small, and the trade ruled dull for all descriptions of Corn. There was little English Wheat offering on sale; its value remains nominally the same as on Monday, notwithstanding the Leading Article in the *Times*, which are generally discredited; bonded Wheat was without inquiry, or holders would have been willing to have accepted late prices.—We observe no alteration in the value of Barley, Beans, or Peas.—The sale of Oats could not be proceeded with to any extent, even at a decline of 1s. per qr.

		Imperial Averages. Wheat.	Barley.	Oats.	Rye.	Beans.	Peas.

Kingsford and Ivy.

Sales by Auction.

HORSELL, SURREY, HALF A MILE FROM THE WOKING STATION ON THE SOUTH-WESTERN RAILWAY.
VALUABLE NURSERY STOCK.

MR WATERER will sell by Auction on Monday, December 15, 1845, and following day, at 10 o'clock for 11 precisely, on the premises, the whole of the valuable and well-selected NURSERY STOCK of Mr. Stephen Spooner (declining business), at Horsell, comprising One Hundred Thousand FIRS AND FOREST TREES, including Spruce, Larch, Pinaster, Stone Pine, and other Firs, from 1 to 12 ft.; Poplars of sorts, Turkey and common Oak, Ash, Beech, Birch, Alder, Lime, and other varieties; two thousand Flowering Shrubs and Evergreens, Portugal and common Laurels, Laurestines; Alexandra Laurel, striped and green Holly, Berberis, and Arbutus, from 1 to 4 ft.; Phillyreas and Yew, from 3 to 5 ft.; Green and variegated Box, from 1 to 5 ft.; Pyruses of sorts; 40,000 bedded and Seedling Quick, a large quantity of Seedling Oak, Birch, Ash, Spruce Firs, and Sycamore; eight thousand Standard and Dwarf Roses of the most choice sorts; a thousand Standard and Dwarf Fruit Trees, including Apples, Pears, Cherries, Peaches, Apricots, and Plums of the best sorts; Rhododendrons, Kalmias, and Azaleas; Honeysuckles, a large quantity of Mussel, Brussels, Crab, and other stocks; the whole in great perfection, and will remove safely, having been transplanted within the last three years. May be viewed three days previous to the sale, and Catalogues had on the premises, and will be forwarded by post on application by letter, inclosing four postage stamps, to Mr. STEPHEN SPOONER, Horsell, Surrey; or to Mr. WATERER, Auctioneer, Land and Timber Surveyor, Chertsey, Surrey.

EXTENSIVE SALE OF NURSERY PLANTS.

MESSRS. TOMPSETT & ALLEN have received directions from Mr. HOOKER, to Sell by Auction, on Tuesday, the 17th of December, and the Six following days, the whole of his STOCK OF PLANTS, now standing upon more than Twenty acres of land, in the Parish of Brenchley, Kent. The STOCK comprises the usual variety of Nursery Plants, many of which are rare and of large size. The Sale to commence at Ten o'clock precisely on each day, in consequence of the shortness of the days. Catalogues may be had of Mr. G. Lodge, Seedsman, Covent-garden; of the Auctioneers, at Peckham; and on the Premises, one week before the Sale. Brenchley is 7 miles from Tunbridge-wells, and 3 from Paddock-wood Station of the Dover Railway. Post town—Goudhurst.

DORKING, SURREY.—TO NURSERYMEN.

TO BE DISPOSED OF immediately, the old-established NURSERY BUSINESS OF MR. ROBERT STLAND, in an eligible situation at Dorking, fronting the Spike-road. The whole of the Stock to be taken at a valuation. The commodious House, with the Seedshop, useful Buildings, and Nursery Garden, is let at a moderate rent, and may be entered upon immediately.
For particulars, apply to Messrs. HART & HART, Solicitors, Dorking, Surrey.

TO GARDENERS AND NURSERYMEN.

TO BE LET, with immediate possession, close to a Market Town in Suffolk, a neat and comfortable DWELLING-HOUSE, and to which can be added a sufficient quantity of excellent Arable Land for a productive Garden and Nursery ground. Satisfactory references will be required.—For further particulars apply to Mr. UTTON, Brome, near Scole, Norfolk.

SMITHFIELD CATTLE SHOW.

TRAINING TILES.—At the approaching Cattle Show in Baker-street, will be shown
AINSLIE'S PATENT IMPROVEMENTS
in MAKING and DRYING Draining Tiles of the FIRST CLASS.—Gentlemen having works in operation, or who are about to erect them, will find the above worthy their attention.
The PROCESS combines EFFECT with ECONOMY, as Tiles can be made ready for BURNING at all seasons; generally from ten to forty hours, according to the nature of the clay. To be seen at Alperton, Acton, Middlesex; Mr. HOWE, Engineer, Great Guildford-st., Southwark; the Polytechnic Institution, Regent-street, London. Particulars may be had from JOHN AINSLIE, Alperton, Acton, Middlesex.

SMITHFIELD CATTLE SHOW.

SKIRVING begs to acquaint his friends and the public, that he will attend at the ensuing Smithfield Show, to exhibit roots of his IMPROVED SWEDE TURNIP, and take orders for the Seed of it, and all other approved kinds of Agricultural Seeds.
S. having of late years enlarged his Nursery, to an extent without any precedent in England, has now on hand a most extensive stock of Trees and Shrubs of every kind, and will be happy to treat with gentlemen about to plant, on the most reasonable terms.—Walton Nursery, Liverpool, Dec. 6.

CAUTION.—SMITHFIELD CATTLE SHOW.

MRS. MARY WEDLAKE, widow of the late Mr. Thomas Wedlake, respectfully reminds her friends and the Agriculturists generally, that she will exhibit this year SEVERAL USEFUL MACHINES, at the Horse Bazaar, Baker-street, which must attract the attention of those who are desirous to avail themselves of the assistance of first-rate improved agricultural machinery, combining utility, economy, and durability.
London Warehouse, 118, Fenchurch-st., opposite Mark-lane.
N.B.—No connection with any other house. Please to observe the name. "MARY WEDLAKE."

SMITHFIELD CLUB PRIZE CATTLE SHOW.—1845.

THE ANNUAL EXHIBITION OF PRIZE CATTLE, Seeds, Roots, Implements, &c., will take place on the 10th, 11th, 12th, and 13th December, at the HORSE BAZAAR, Baker-street, Portman-square.
Stands No. 90, 91, and 92, will exhibit a shed, 30 feet long by 20 feet wide, covered with
CROGGON'S PATENT ASPHALTE FELT,
which can be had on application to
THOMAS JOHN CROGGON, 8, Laurence Pountney Hill, Cannon-street, London.

IMPROVED DIBBLING MACHINE.

JOHN WEATHERSTONE begs to inform the Agricultural Public that his PATENT HORSE-DIBBLING MACHINE is now ready, whereby the greatest regularity may be secured in the deposition of all Seeds. A team of four horses will be found sufficient power to draw one of the largest size.
Price of Machine, with six rows..... £35
" eight rows..... 40
" ten rows..... 45
Applications for further particulars may be made to Mr. JOHN WEATHERSTONE, Cassington, near Oxford; or to Messrs. GILL & WARD, High-street, Oxford.—Agents wanted in all parts of the country.

SINGLE'S HAND-DIBBLING MACHINE.—Twelve of these Machines will be exhibited at the Great Smithfield Cattle Show, on Wednesday, December 10th and following days. Two are now manufactured together to plant a large quantity, thereby effecting a great saving in labour and seed.—WILLIAM E. RENDLE & Co., Plymouth, Dec. 6.

THE ARCHÆOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.

CENTRAL COMMITTEE, October 6, 1845.

PRESIDENT.—THE MOST NOBLE THE MARQUIS OF NORTHAMPTON.

Rev. THOMAS WORSLEY, M.A. Master of Downing College, Cambridge.

Editor of the Publications of the ARCHÆOLOGICAL INSTITUTE and Resident Secretary, T. HUDSON TURNER, Esq. Hon. Member Ant. Soc. of Newcastle.

THE ARCHÆOLOGICAL INSTITUTE of Great Britain and Ireland is formed in order to examine, preserve, and illustrate all Ancient Monuments of the History, Manners, Customs, and Arts of our Forefathers.

The means by which the Central Committee propose to effect this object are—

1. By holding communication with correspondents throughout the Kingdom, and with provincial Antiquarian or Architectural Societies; as well as by direct intercourse with the Comité des Arts et Monuments of the Ministry of Public Instruction in France, and with other Associations on the Continent instituted for the advancement of Antiquarian Science.

2. By holding frequent and regular meetings for the consideration and discussion of communications received from correspondents and other persons.

3. By procuring careful observation and preservation of Antiquities discovered in the progress of Public Works, such as railways, foundations of buildings, &c.

4. By encouraging individuals, or public bodies, in making researches and excavations, and affording them suggestions and co-operation.

5. By opposing and preventing, as far as may be practicable, any injuries with which Ancient National Monuments of every description may from time to time be threatened.

6. By using every endeavour to spread abroad a correct taste for Archæology, and a just appreciation of Monuments of Ancient Art.

7. By collecting accurate drawings, plans, and descriptions of Ancient National Monuments, and by means of correspondents preserving authentic memorials of antiquities which may from time to time be brought to light.

8. By establishing a Journal devoted exclusively to the objects of the Institute, as a means of spreading antiquarian information, and maintaining a constant communication with all persons interested in such pursuits.

9. By taking every occasion which may present itself to call the attention of the Government to the conservation of our National Monuments, and to the other objects of the Institute.

RULES AND REGULATIONS OF THE ARCHÆOLOGICAL INSTITUTE.

I. THE ARCHÆOLOGICAL INSTITUTE of Great Britain and Ireland shall consist of Life Members, contributing a donation of not less than 10*l.*, of Annual Members contributing not less than 1*l.* each year, and of Corresponding Members who, taking an interest in the objects of the Institute, and being disposed to give furtherance to them without any pecuniary contribution, may desire to attach themselves to the Institute. The Corresponding Members shall not be entitled to vote, nor have any other privileges.

II. The Government of the Institute shall be vested in a Central Committee, consisting of a President, four Vice-Presidents, three Honorary Secretaries, a Treasurer, and twenty-four ordinary Members.

III. The President's tenure of office shall be for one year.

IV. The Honorary Secretaries and Treasurer shall be elected by the Committee, who shall also have the power of electing a Secretary, at such a salary as they may consider proper.

V. The Election of the President, Vice-Presidents, and Members of the Central Committee shall be made by the ballot of the Life and Annual Members at the Annual Meeting. The Committee shall select one Vice-President and six members of their body, who are to go out annually, and shall nominate one Vice-President, and six other Members to fill up the vacancies. The names of those who go out, and of those who are proposed to supply their places, shall be hung up in the Local Committee Room during the whole time of the Annual Meeting, and a printed copy of such lists furnished to each Member of the Institute, with his ticket for the Annual Meeting. No Member of the Committee, except the Honorary Secretaries and Treasurer, shall remain on the Committee more than four years, or be eligible to serve again until after the lapse of one year. Any Member of the Institute is at liberty to substitute on the list other name or names for those proposed by the Committee.

VI. The Committee shall be empowered to fill up *pro tem.* by election all occasional vacancies that may be caused by the death or resignation of the President, or any of the Vice-Presidents or ordinary Members of the Committee.

VII. These vacancies shall be supplied on the recommendation of at least three Members of the Committee, made in writing at one of the ordinary Meetings: the proposed Member to be balloted for at the succeeding ordinary Meeting.

VIII. The Annual Meeting shall be holden in one of the cities or principal towns in the kingdom, at which the elections, the appointment of the place of meeting for the ensuing year, &c., shall take place. Notice of this Meeting shall be given by one of the Honorary Secretaries, by order of the Committee.

IX. The Committee shall have the power of nominating a certain number of Local Vice-Presidents.

X. No other General Meeting of the Institute shall be holden without the consent of at least three-fourths of the Committee, expressed in writing: for such Special Meeting, a notice of at least three weeks shall be given by advertisements in the public papers. At this Special Meeting, the President, or, in his absence, one of the Vice-Presidents, shall take the chair, and, in their absence, the Committee shall appoint a Chairman.

XI. Neither at the General Annual Meeting, nor at any Special General Meeting, shall any alteration of, or addition to, any of the Rules or Regulations of the Institute be submitted to the Meeting, unless upon a proposal in the form of a resolution in writing, signed by two Life or Annual Members: which shall have been sent to the Committee one month previous to the Meeting, and suspended in their committee-room.

The Summons for the Special General Meeting shall specify the Resolution or Resolutions to be submitted to the Meeting, and the discussion shall be confined to that object only: in case such proposed Resolution or Resolutions shall be carried, another Special General Meeting shall be summoned by the Committee after the lapse of not less than a fortnight, or more than a Month, for the sole purpose of ratifying or rejecting such Resolution. If, however, the first-mentioned Special Meeting take place at a time not more than two Months before the Annual Meeting, then such Resolution or Resolutions shall be ratified or rejected at that Annual Meeting.

XII. The Chairman of the Annual, or any other General Meeting, shall have an Independent as well as a Casting Vote.

XIII. A certain number of persons, not usually resident in London, shall be associated with the Central Committee as Honorary Members of that Body, and shall be entitled to a Vote at their Meetings. Such Honorary Members shall be proposed on the recommendation of at least three Members of the Committee, and the Election shall take place at the succeeding Ordinary Meeting.

XIV. The Committee shall appoint a certain number of persons, not resident in London, as their Local Secretaries.

XV. The Election of Local Secretaries and Corresponding Members shall be made by the Committee on the proposal of one of the Members thereof, either on his own personal knowledge or on the recommendation of two subscribing Members of the Institute.

XVI. In these and all other Elections made by the Committee, it shall be allowable for any Member thereof to demand a Ballot.

XVII. Subscriptions and Donations may be paid to the Treasurer, to any Member of the Committee, or to the Account of the Archæological Institute with the Bankers of the Institute, and no Subscriber shall be entitled to Vote at the Annual Meeting who has not paid his Subscription. The Year shall be considered as closing with the termination of the Annual Meeting; from which time the Subscription for the ensuing year shall become due.

XVIII. The Cash Book, and an account of all Receipts and of the Balance in the Bankers' hands, shall be laid on the table at each Meeting of the Central Committee. All Bills having been duly examined, and approved in writing, shall be paid by Cheque upon the Bankers, signed by the Treasurer.

XIX. The Accounts of the Institute shall be submitted Annually to two Auditors, who shall be elected for that purpose by the Members of the Institute at the General Meeting, and who shall attest by their Signatures the accuracy of the said Accounts. The Accounts having been thus approved, shall be submitted to an Annual Meeting of the Committee, to be holden on the First Wednesday in May, and shall be printed and published in the Journal of the Institute as part of the proceedings of the Committee.

XX. A Report of the Proceedings of the whole year shall be submitted to the Annual Meeting.

XXI. The Central Committee shall be empowered to make such Bye-Laws as may, from time to time, appear to them expedient.

The Central Committee request the Local Secretaries to attend, whenever it may suit their convenience, the Ordinary Meetings, which take place once in every fortnight at the apartments of the Institute, 12, Haymarket, for the discussion of Archæological communications and the exhibition of objects of interest.

ORDINARY MEETING OF THE CENTRAL COMMITTEE:—

12, HAYMARKET. *The Chair will be taken at Four o'clock.* **Monday, December 8.]**

Subscriptions may be paid to the Bankers, Messrs. COCKBURNS, 4, Whitehall. All communications should be addressed to
T. HUDSON TURNER, Esq. 12, Haymarket.

NEW MORNING PAPER,

TO BE COMMENCED EARLY IN THE NEW YEAR.

THE DAILY NEWS.

A MORNING NEWSPAPER OF LIBERAL POLITICS AND THOROUGH INDEPENDENCE.

THE leading features of the Paper may be briefly stated under the following heads:—

Its CITY NEWS AND COMMERCIAL INTELLIGENCE, collected from the highest sources, will be scrupulously impartial, and always early.

Its SCIENTIFIC AND BUSINESS INFORMATION on every topic connected with RAILWAYS, whether in actual operation, in progress, or projected, will be found to be complete.

An extensive system of FOREIGN CORRESPONDENCE in all parts of the world, has been for some time, and is now, in course of organization.

Its PARLIAMENTARY REPORTS, its LAW REPORTS, and every other item of such matter, will be furnished by Gentlemen of the highest qualifications.

Among the writers of its LEADING ARTICLES, its Criticisms on BOOKS, the DRAMA, MUSIC, and the FINE ARTS, are some of the most distinguished names of this time.

The LITERARY DEPARTMENT OF THE DAILY NEWS will be under the direction of MR. CHARLES DICKENS.

☞ The Counting-house, and Office for Advertisements intended for insertion in THE DAILY NEWS, will be at No. 90, FLEET STREET, LONDON; to which place any Communications for the Editor should be addressed, until the Publishing Offices in WHITEFRIARS shall be completed.

ON THE FIRST OF EVERY MONTH, PRICE ONE SHILLING,

THE HORTICULTURAL MAGAZINE.

PART XII. CONTAINS

The Description, Culture, and an Illustration of a New Hardy Annual — The Cultivation of Flowering Thorns, with Illustrations and Descriptions of all the varieties—The Cultivation of the Gladiolus, with Five Illustrations and Descriptions of all the varieties—A Description of all the New Seedling Pelargoniums exhibited this year—Hints for the Cultivation of the Twenty-four most Popular Flowers—Alpine Plants—New Flowers—Horticultural Notes—Geology—The Practical Management of Gardens, Greenhouses, Orchards, &c.

London: HOULSTONE and STONEMAN, Paternoster-row, and all Booksellers.

*** Advertisements, Books for Review, and Communications for the Editor, to be sent to the Publisher.

ELEGANT PRESENT.

On the 11th of December will be published, price 16s.,

THE ANNALS OF HORTICULTURE, handsomely bound in arabesque, richly gilt, containing 138 engravings, a beautifully-coloured frontispiece, and 580 pages of original information on Gardening and Planting, including the culture and management of all popular Flowers, and Flowering Shrubs.

HOULSTON and STONEMAN, Paternoster-row; W. WHYTE and Co., Edinburgh; W. CURRY and Co., Dublin. Orders received by all Booksellers.

THE CORN AND PROVISION TRADES.—The deficiency of the Harvest, the failure of the Potato Crop, and the consequent serious effects upon commercial and monetary affairs, excite great apprehension. Under such circumstances, correct information as to the produce of the harvest, the extent of the failure of the Potato Crop, the state of the markets, the stock of grain on hand, on the continent of Europe, and in the United States, is of the highest importance. No trouble or expense is spared to furnish such information, which is brought down to the latest moment of going to press, in the MARK-LANE EXPRESS, which has been for many years the authority in the Corn and Provision Trades in England and in foreign countries. Published every Monday in time for post, and may be had by order of all Booksellers, Newsmen, &c. Office, No. 24, Norfolk-street, Strand. Price 1l. 10s. 4d. per annum.

TO BE SOLD.—THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE for 1844, in Numbers, clean and complete. Price One Guinea.—Direct to C. D., 8, Duke-street, Grosvenor-square.

THE HAND BOOK OF FOUNTAINS and GUIDE TO VERSAILLES; by FREEMAN ROE, Engineer and Fountain Maker 70, Strand, London. To be had of the Author and all booksellers. Price 1s.

This little work contains full instructions for erecting Fountains on a large or small scale.

Published by R. GROOMBRIDGE and SONS, Paternoster-row.

THE TENANT FARMERS' ADVOCATE.—It is abundantly manifest that the position of the Agricultural Interest as a class is undergoing and must undergo a great change. In such change the relative position of "LANDLORD AND TENANT" will form the most important feature, and the establishment of a sound system of "Tenants' Rights" will be a cardinal point for "Tenant Farmers." For 14 years THE MARK-LANE EXPRESS AND AGRICULTURAL JOURNAL has been the zealous and uncompromising advocate of the TENANTS' RIGHTS, and with the conviction that the interests of the Tenantry are vitally involved in the question, the columns of this Journal will be continuously devoted to its discussion and elucidation. Published every Monday in time for Post. May be had by order of all Booksellers and Newsmen.—Office, 24, Norfolk-street, Strand, London. Price 1l. 10s. 4d. per annum.

THE POPULAR REMEDY.

PARR'S LIFE PILLS.—The extraordinary success of this medicine is the wonder of the age; it has been tried by hundreds of thousands as an aperient, and has in every instance done good; it has never in the slightest degree impaired the most delicate constitution. Tens of thousands have testified that perseverance in the use of PARR'S LIFE PILLS will completely cure any disease, and are living witnesses of the benefit received from this invaluable medicine.—Testimonials are received daily, and it would be impossible, in a newspaper, to publish one-half received; and the following are selected as people well known in their respective neighbourhoods, and whose testimony is unquestionable. Further sheets of Testimonials and the "Life and Times of Old Parr" may be had gratis of all Agents.

The following important testimony to the efficacy of PARR'S LIFE PILLS has just been received by the Proprietors:—"To Messrs. T. Roberts and Co., London. Athlone, Dec. 7, 1844. Sirs,—You will please to send me six dozen more PARR'S LIFE PILLS, I am just out. They are taking well, and, I can assure you, they are doing an immensity of good; everyone who has tried them in affections of the Liver and Stomach derives a great deal of benefit. Yours, &c., WILLIAM GILCHRIEST, Apothecary and Surgeon.

"Long Benton, near Newcastle, August 11, 1845. Sirs,—I beg to thank, and inform you, of the wonderful effect of your PARR'S LIFE PILLS. I was long subject to Shortness of Breath, with Cough, &c., but after taking your Pills a short time, I am not only cured but feel quite young again, and, although an old man of 60, I feel so much better that I think I shall live to be 90 at least. If you think this will be of service you are quite welcome to print it. Yours, with much respect, PETER MURPHY."

Beware of spurious imitations of the above medicine. None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS ON A RED GROUND, engraved on the Government Stamp, pasted round each box; also the fac simile of the Signature of the Proprietors, "T. ROBERTS and CO., Crane-court, on the directions.

Sold in boxes, at 1s, 1½d., 2s. 9d., and family packets at 11s., by all respectable druggists and patent medicine retailers throughout the kingdom.

☞ Full directions are given with each box.

CORN LAWS.—Third Edition, now ready, price 2s.

AN ATTEMPT TO ESTIMATE THE EFFECTS OF PROTECTING DUTIES ON THE PROFITS OF AGRICULTURE. By JOHN MORTON, F.G.S., author of "The Nature and Properties of Soils," &c., and JOSHUA TRIMMER, F.G.S., author of "Practical Geology and Mineralogy."

JAMES RIDGWAY, Piccadilly, and all Booksellers.

Also, THE NATURE AND PROPERTY OF SOILS AND THE RENTS AND PROFITS OF AGRICULTURE. By JOHN MORTON, Fourth Edition, 10s.

GARDENERS' CHRONICLE.—A Gentleman, having the *Gardeners' Chronicle* for the years 1841, 1842, 1843 and 1844, complete in Half-year Volumes, neatly bound in cloth, and perfect, wishes to dispose of them. The whole for £5 10s.—Apply at the Office of the *Gardeners' Chronicle*.

Just Published, and to be had

FOR NOTHING.—A Pamphlet on Nervous or Mind Complaints, with Cases and Testimonials.—The nervous are invited to send to the Rev. Dr. WILLIS MOSELEY, 9, Bloomsbury-street, Bedford-square, for a small pamphlet, just published, on his new and most successful TREATMENT of NERVOUS or MIND COMPLAINTS, by which he now cures these diseases as certainly as water quenches thirst, and the pamphlet will be returned free if one stamp is sent.

EVENINGS WITH THE GREAT COMPOSERS.

THE SUCCESS which has attended the Lectures delivered by Mr. HENRY LINCOLN, at various Literary Institutions, the crowded audiences by which they have been honoured, and the approbation with which they have been received, alike by the public and the press, lead to the inference that there is a large body of intelligent persons who are desirous of becoming acquainted with the Great Works of the Great Masters. Mr. LINCOLN therefore proposes to give a series of

LECTURES, WITH MUSICAL ILLUSTRATIONS,

AT THE

WESTERN INSTITUTION, LEICESTER-SQUARE,

in which he will, each evening, offer an outline of the Musical life and labours of one or other of these great men, tracing the development of his powers, marking his peculiarities and characteristics, with such Vocal and Instrumental Illustrations as may best tend to elucidate the subject, and gratify and satisfy a cultivated and refined taste. The Evenings at present fixed are—

Dec. 9th, 16th, and 23d Dec. to

Cherubini. Cimarosa. Mendelssohn.

This Series will be followed by Evenings devoted to Bach, Beethoven, Boieldieu, Gluck, Gretry, Handel, Jomelli, Meyerbeer, Mozart, Paiesiello, Purcell, Schubert, Spohr, Spontini, Weber, and others—the Master Minds of Europe, various in power and originality, but all of great interest:—some only known by name in England, many only known for one or two works, not one in all the infinite variety in which his genius made itself manifest.

On Tuesday next, December 9.

CHERUBINI.

Illustrations.

PART I.

Romance	Miss DUVAL
Duet	Miss LINCOLN and Miss DUVAL
Two Canons—"Perfida Clori," and "Evviva Bacco"	Miss LINCOLN, Miss DUVAL, and Mr. LOCKEY

To commence at Eight o'clock.

Tickets 2s. for each Evening, may be had at the Institution, and Reserved Seats 3s. of Mr. LINCOLN, 9, Upper John-street, Golden-square.

PATENT PORTABLE SUSPENSION STOVES, of which more than Four Thousand were sold last winter, are admirably adapted for Greenhouses and Conservatories, their principle of Ventilation effectually carrying off all those gases which are injurious to plants. Prospectuses may be obtained, and the Stoves seen in operation, at GEORGE & JOHN DEANE'S, opening to the Monument, 46, King William-street, London-bridge.

TO AGRICULTURISTS.

FOR ROLLING WHEATS AS SOON AS SOWN and for Rolling Barley Stubbles in Autumn, again Winter, and once or twice in Spring, on which the Clover has a tendency to throw out.

Practical opinion of one of the first Farmers in England, Mr. Hannam, North Deighton, Wetherby, Yorkshire; well known to the agricultural world:—

"I have every reason to believe that the Patent Roller in one instance, saved its cost and more for me, in a six-piece of Wheat, which was in a fair way of vanishing, through the devastations of the wireworm, in April last; I put the Roller over it twice (up the lands and across them), and in very short time I was fully convinced of the benefit, by the gathering of the Plant. I may safely say I shall have two seven Bushels per acre, although at one time I had given it to have the piece ploughed up. A neighbour also used a Roller with similar effects."

Mr. CROSSKILL directs the attention of Agriculturists in England to the fact, that he has received for his Patent Roller and Improved Liquid Manure Cart, First Prizes at the great Agricultural Meetings of England, Ireland, and Scotland, for each of these Implements.

Present Cash Price of Patent Roller, delivered in Hull—4 feet 6 inches, 21l.; 6 feet, 19l. 10s.; 5 feet 6 inches, 18l. In all probability the price of Rollers will be increased from the advance in iron. Potato Steamer complete, 4l. 17s. 6d.

Improved Liquid Manure Carts, small size, 14l. 12s.; with pump and hose complete, 5l. 8s. extra.

Ditto, ditto, ditto, large size, 18l.; with pump and hose complete, 7l. extra. Improved Potato Washers, 4l. 10s.

Patent Peg Portable Threshing Machine, four horse-power, with travelling wheels, &c. only 50l. Dressing Machine, &c.

Patent Wheels and Axles, 5l. 10s. and 8l. 10s. per pair, to carry 30 cwt.

One-horse carts, with iron axletrees, 10l. 10s. & 11l. 11s.

Earl Ducie's Improved Cultivator, 10l. 10s., and every other Implement used in Agriculture may be had from the Berwick Iron Works.

P.S.—Models of Improved Implements will be exhibited at the forthcoming Smithfield Show, held in Baker-street. London, where Orders will be received, and every information given.

Beverley, near Hull, Dec. 6, 1845.

HYDRAULIC RAMS to be had of FREEMAN ROE, Engineer and Fountain Maker, 70, Strand, London. Rams adapted to all situations.

No. 1 Ram,	Supply Pipe,	4 inches.
No. 2 Ram,	Ditto	2 inches.
No. 3 Ram,	Ditto	1 inch.

Deep Well Engines and Pumps worked by Steam, Horse-power, or Manual-labour. Fountain Basin in Iron, from Rowley's pattern. Jets made to any device. Buildings, Baths, &c. heated upon the most simple and economical plan. Closets, Cooking Apparatus, &c.

Sole Agent for TRUMAN'S PATENT WATER PURIFIER.

The AGRICULTURAL CHEMICAL ALMANAC, by FREEMAN ROE, price 2d., now ready.

HEAL AND SON'S LIST OF BEDDING, containing a full description of Weights, Sizes, and Prices, by which purchasers are enabled to judge the articles that are best suited to make a good set of Bedding. Sent free by post, on application to their Establishment, the largest in London exclusively for the manufacture and sale of Bedding (no bedsteads or other furniture being kept).—HEAL and SON, Feather Dressers and Bedding Manufacturers, 196, opposite the Chapel, Tottenham-court-road.

ROWLAND'S ODONTO, OR PEARL DENTIFICE, patronised by Her MAJESTY, H.R.H. PRINCE ALBERT, the Royal Family, and the several Courts of Europe, A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and, by the removal of that extraneous substance, induces a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the enamel, substituting for discolour and the aspect of impurity, the most pure and pearl-like whiteness, while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2s. 9d. per box duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp, thus,—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each Box. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

THE EARL OF ALDBOROUGH AND HOLLOWAY'S PILLS.—An Astounding Cure by this Miraculous Medicine, after every other means had failed. See Extract of his Lordship's Letter, dated Villa Messina, Leghorn, Feb. 28, 1845. "To Professor Holloway. Sir, I beg to acquaint you that your Pills have effected a cure of a disorder in my liver and stomach, which all the most eminent of the Faculty at home and all over the Continent had not been able to effect; nay, not even the waters of Carlsbad or Marienbad. Signed ALDBOROUGH."—These wonderful Pills will cure any disease of the Liver and Stomach. Sold (also HOLLOWAY'S Ointment) at Professor HOLLOWAY'S Establishment, 244, Strand, London, and by all Medicine Vendors throughout the civilised world.

Printed by WILLIAM BRADBURY, of No. 6, York-place, Stoke Newington, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the Office, No. 6, Charles-street, in the parish of St. Paul's, Covent Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, December 6, 1845.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

E. BECK informs the Public that the various Articles manufactured by him in Slate for Horticultural purposes, may be seen in use at Worton Cottage, Isleworth, upon application to the gardener (*Sundays excepted*).

BECK'S SEEDLING PELARGONIUMS, 1841.—E. Beck informs the public that his sale of the above will terminate on January 1st, 1846. The small portion remaining well established in 4½-inch pots. N.B.—E. B. proposes to send out another selection after the Exhibitions of 1846.
Worton Cottage, Isleworth.

SUPERIOR NEW EARLY PEA.—WARNER'S "EARLY EMPEROR" Pea, the earliest in cultivation, quite hardy, a good Cropper, with fine Pods, and most delicious flavour. Height about 2 ft.—5*s*. per quart.—To be had of Warner and Warner, Seedsmen, 28, Cornhill, London.

POTATOES FROM THE SCILLY ISLANDS.
W. E. RENDLE and CO. have been fortunate in procuring a few Tons of these POTATOES, *all of which were entirely free from the prevailing disease, and will be found most valuable for seed*. Refer to the Rev. C. A. John's Letter in the *Gardeners' Chronicle* last week, page 801.
Price on application.
Plymouth, Dec. 13, 1845.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s*. per dozen.—The importation of the above-named Bulb has just been received at A. Cobbett's Italian and Foreign Warehouse, 16, Pall Mall. The Orange, Lemon, Citron, Lime, and Shaddock Trees. Catalonia, Agorian, and Arabian Jessamine Plants expected early in January.

LEE'S DWARF ITALIAN MARROW PEA.
J. AND C. LEE intend sending out the above new PEA this season, and having grown the Stock for the last five years, they can strongly recommend it as a distinct and most excellent variety. Its habit is exceedingly dwarf and robust; it is a very prolific bearer, and the Pea is equal in size to the largest Marrowfat, and is of most delicious flavour. It comes in earlier than any other Marrow. It has been grown in the gardens of Clumber, Welbeck, Thoresby, Nuneham, Tottenham-park, and Tedworth, and is highly extolled by the Gardeners of these places. In Quart Packets, sealed, price 5*s*.
Nursery, Hammersmith.

FAIRBEARD'S "EARLY SURPRISE" BLUE MARROW PEA.
GEORGE CHARLWOOD in submitting the above PEA to the Horticultural public feels confident that he is recommending to their notice an article that will at once prove a great acquisition to the private garden, and likewise of great importance to the market gardener; with this view he begs to submit the following description and Testimonial which he trusts will be a sufficient guarantee as to its character:—It grows from three to four feet high, is equal in flavour to the Knight's Marrow, and as early as the Double-blossomed Frame; an abundant bearer, with pods equal in size to the Marrow Peas generally, and is not subject to mildew. A second crop from the seed of the same year has been gathered in each of the two last seasons.
We, the undersigned, consider Fairbeard's "Early surprise" PEA the best in cultivation, a great cropper, and as early as the Double-blossomed Frame:—J. Creed, gardener to the Right Hon. S. R. Lushington; E. George, gardener to N. J. Knatchbull, Esq.; J. Moneylans, gardener to the Right Hon. Lord Harris; W. Clifton, gardener to the Right Hon. Lord Soudes, Lees Court; William Hughes, gardener to Mrs. Simpson; J. Fox, gardener to the Right Hon. T. P. Leigh; J. Harris, gardener to Sir John Tylden.
Price 3*s*. 6*d*. per quart, with a liberal allowance to the Trade.
14, Tavistock-row, Covent-garden, London.

THE VERY NEWEST AND BEST GERANIUMS AT UNUSUALLY LOW PRICES (Purchaser's selection).
Class I.—One Dozen 2l., Two Dozen 3l. (Cash).
Hoyle's Titus, Sarah Jane, Pompey, Unique, Claude, Duchess of Inverness, Champion, Amelia, Majestica, General Pollock, Rosalia, Flora, and Revenge. Lyne's Imogene, White Perfection, and King of Saxony. Foster's Sultana, Cid, Robustum, Nabob, Dr. Lindley, Duke of Devonshire, and Constellation. Gaines's Alice Hawthorn, Trafalgar, Ackbar, and Duchess of Leinster. Stewart's Prince de Joinville and Stewartii. Silverlock's Emperor Nicholas and Chance. Robson's Lady Ramsden and Meanee. Holmes' Beauty of Sudbury. Hoyle's Louis Philippe, Oddity, and Constellation. Roger's Lady Vernon and Lord Vernon. Gaines's King of the French. Dobre's Vesuvius. Miller's Elegans, Coquette, Constellation, Pet, Phœnix, Brunhilda, Victoriane.

Class II.—One Dozen 2l., Two Dozen 3l. (Cash).
Gaines's Sir W. Massey Stanley, Mogul, Conspicua, King of the French, Ackbar, King of the Belgians, King of Saxony, and Duchess of Sutherland. Miller's Mogul. Catleugh's Mulberry, Eclipse, and Duchess of Sutherland. Foster's Hybla, Coronation, Superb, Shield of Achilles, Nabob, Oddity, and Conflagration. Cock's Maid of Honour. Lyne's Princeps, Redworth, Coronet, King of Saxony, and Lady Tamworth. Sorrell's Pride of Essex. Cock's Hector. Beck's Cleopatra, Meteor, and British Queen. Pamplin's Fire King. Gaines's Elegans Nova and Sir R. Sale. Hoyle's Rosalia and General Pollock. Miller's Claud Darnaud, Hercules, Shackbolt, Shakspeare.

Class III.—One Dozen 1l., Twenty 1l. 10s.
Beck's Martha, Leonora, and Lucy. Gaines's Lady Sale and Queen Phillippa. Garth's Constellation and Black Dwarf. Miller's Tom Jones and Prince of Wales. Catleugh's Rosetta Superb. Foster's Pulchellum, Gipsy, and Favourite. Beck's Geraldine, Black Prince, Hebe, Evening Star, and Stella. Chandler's Celestial. Pamplin's Beauty of Walthamstow, Count d'Orsay, Enchantress, Camilla, and Oberon. Appleby's Mercury. Stewart's Mrs. Lawrence, Queen of Bourbons, and Beauty of Salt Hill. Thurtell's Pluto. Veitch's Fair Maid of Devon. Lyne's Duke of Cornwall, Sunrise, Duke of Clarence, and Circassian, &c. &c.
Twenty real good distinct sorts for 1l.; Twenty of New and very superior Show Flowers for 2l. Purchasers sending the names of the sorts they already possess, W. Miller will send suitable distinct varieties.
** No charge for package, and plants put to compensate for carriage. All orders must be accompanied by cash or reference.—William Miller, Providence Nursery, Ramsgate.

CHARLES FARNES, Seedsman, 128, St. John's-street, London, respectfully informs his Friends and the Public generally, that he will be enabled to supply orders for the following new and choice VEGETABLE SEEDS:—
ROYAL GREEN MARROW PEA.—This most excellent Variety may be sown as a second early Pea, and will be fit for use about the same time as the Early Warwick; it will be found on trial that no Pea can surpass its flavour or rich colour when boiled. Price 2*s*. 6*d*. per quart.
QUEEN OF DWARF PEA.—It is superior to all the dwarf Peas known, and only requires more general cultivation to test its merits, when it will supersede every other variety of the same habit. Price 5*s*. per quart.
DANCER'S MONASTERY PEA.—This fine large Pea will be found superior to all the old sorts for a middle crop. It is an excellent bearer, and of good flavour, and merits a place in all gardens. Price 2*s*. 6*d*. per quart.
A general CATALOGUE of all the new Vegetables, &c., will be forwarded on application.—Dec. 13.

CUTHILL'S BLACK SPINE CUCUMBER, the earliest and best Bearer, and a very handsome Fruit, taken the prize at the first Show of the Royal South London Society, for these six years past. 2*s*. per packet.
CUTHILL'S Early Scarlet Flesh MELON, grown by every Melon grower for first crop for Covent Garden. 2*s*. per packet.
Passingham's Green Flesh do., a most delicious flavour. 2*s*. do.
The British Queen and Keen's Seedling Strawberry Plants, in pots for forcing, very strong.
Lisianthus Russellianus, with directions 1*s*. 6*d*.
Lianthus nigrescens, 3*s*. 6*d*. per packet.
Lianthus glaucifilius, 1*s*. 6*d*. per packet.
Cuthill's Prince of Denmark, Scarlet Clove Carnation; also the French Yellow Picotee, with other first rate Picotees and Carnations, at 12*s*. per dozen.—Direct to J. Cuthill, Florist, Denmark-hill, Camberwell, near London.

FOREST-TREES, &c.—The Subscribers beg to intimate that they are prepared to execute orders, during the Planting Season, for all kinds of Forest and Ornamental Trees, Fruit Trees, Shrubs, Roses, &c.
They have succeeded in procuring their Stock of Forest Trees from the best varieties, and have made it a main object to prevent the admixture of degenerate productions. They beg to direct attention to their Collection of CONIFERÆ, which have withstood the last two winters in the open ground, and may therefore be considered sufficiently hardy for this climate.
They are proceeding to enlarge their ARBORETUM, which already contains handsome specimens of Ornamental and Rare Trees, which will be allowed to attain a considerable size, for the purpose of guiding Purchasers in their choice, and also to prove their suitableness for the climate.
Their Stock of the true Red-wooded HIGHLAND PINE is very large, and raised from seeds collected by themselves in the Native Forests of the Spey and Dulnain rivers. They have also a choice Collection of GREENHOUSE PLANTS, to which they are constantly adding approved novelties.
They are desirous to arrange their prices with moderation, and likewise to assist their customers at a distance in the carriage of their plants, where there are no facilities of transport. Catalogues of Forest Trees, Shrubs, Roses, Greenhouse Plants, and everything connected with the Nursery and Seed Trade, may be had free on application. Planting contracted for and executed under proper superintendence.
Lawson and Smith, Nursery and Seedsmen.
Inverness, Dec. 12.

VICTORIA NURSERY, CORK.—FOREST TREES.
J. & H. HAYCROFT can deliver free at any of the undermentioned ports, strong transplanted LARCH, 2 to 3 feet high, at 15*s*. per 1000, and 3 to 4 feet high at 18*s*. per 1000; also small LARCH 9 to 15 inches high (fit for planting in clean ground) at 7*s*. 6*d*. per 1000. By steam-vessels to London in four days, to Liverpool, Bristol, and Plymouth, in 30 hours, and by sailing vessels to Newport, Cardiff, Neath, Swansea, and nearly every port in South Wales.

BRACONDALE HORTICULTURAL ESTABLISHMENT.
TRUE "FASTOLFF" RASPBERRY
JOHN BELL begs to inform his friends and the public he continues to supply the above RASPBERRY. The trade supplied on liberal terms when large quantities are taken.
J. B. has a very Extensive Collection of Standard and Dwarf ROSES, fine strong plants, at the following prices, the selection being left to J. B.

Full Standards, best varieties, one of a sort, per			100.	£10	0 0
Ditto	Ditto	Ditto	50.	5	0 0
Half ditto	Ditto	Ditto	100.	7	10 0
Ditto	Ditto	Ditto	50.	3	15 0
Full Standards, fine show varieties			doz.	1	0 0
Half ditto	Ditto			0	15 0
Dwarf	Ditto			9*s*. to 12*s*.	

** A few fine Strong FRUITING PINE PLANTS for Sale.

RARE AND BEAUTIFUL COLUMBINE.—The Subscribers beg to offer strong Plants of their superb AQUILEGIA GLANDULOSA, sent free by post at 1*s*. 6*d*. per pair, or 6*s*. per dozen, or stamps of that value. Seeds of the same new variety will be sent free at 1*s*. 6*d*. per packet. This Plant is adapted to the open ground, being a hardy perennial. It abounds in bright two-coloured Blossoms, blue and white. Before seeing the flower, its cheapness is apt to mislead the Florist respecting its merits, which are by no means common. The following is the opinion of the Editor of the *Gardeners' Chronicle*, extracted from that Paper of 29th November last:—"New Plants.—John Grigor. Your Aquilegia is certainly one of extraordinary beauty; a flower now before us is upwards of 4 inches in diameter. We have often wondered that Aquilegias were not more the object of a gardener's care."
Nurseries, Forres, N. B.—James Cocker & Co.

TO CHRAMUM EXHIBITORS, &c.—DELTVA PANSIES.
JAMES WHITE, Florist, Shacklewell, having purchased the undermentioned Seedlings of Mr. Robert Catleugh, has fine strong plants ready for delivery at the undermentioned prices:—"Cilo" clear white purple spot, good shape, fine trusser, and fine show flower, very early and free bloomer, 1l. 10*s*. "La Polka," upper petals deep crimson purple, surrounded by a margin of rosy tint; under petals of an even rosy purple, close habit, and abundant bloomer, 1l. 10*s*. "Sunbeam," fine smooth orange dark spot, good shape, fine trusser, and fine show flower, 1l. 1*s*. "Duke of Wellington," upper petals of a light crimson, surrounded with a dash of scarlet, under petals of a deep rosy pink, free bloomer, and good habit, 1l. 1*s*. They have all been successfully exhibited, and can be recommended. All the old-established varieties at the lowest prices.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea. By special appointment to the Queen and H.R.H. Prince Albert.
PHEASANT POULTS.—Gentlemen stocking their preserves are respectfully informed they can be supplied with any quantity of TAME BRED AND WILD PHEASANTS, as above, also a great variety of useful and ornamental Water Fowl, Domestic Poultry, including Malay, Cochin China, Dorking, Spanish, &c., Fancy Bantams, &c., &c., 8, Half-moon-passage, Gracechurch-street.

SEEDS.—CORNER OF HALF-MOON-STREET.
THOMAS GIBBS and CO.
(by Official Appointment) the SEEDSMEN to the "ROYAL AGRICULTURAL SOCIETY OF ENGLAND."
Beg to remind the Members of the Society, and Agriculturists in general, that their only Counting House and Seed Warehouse is at the Corner of HALF-MOON-STREET, PICCADILLY, LONDON, as for the last Fifty Years.
Priced Lists of Agricultural Seeds are always ready, and may be had on application.

FOREIGN SHEET GLASS, of good quality, for Horticultural and general purposes. To be had of F. Elphick's, 29, Castle-street East, Oxford-street. Per Ready Money only.

SMALL GLASS for HOTHOUSES and GARDEN LIGHTS.

PETER LAWSON AND SON,
Seedsmen and Nurserymen to the Highland and Agricultural Society of Scotland.

AGENTS — Messrs. W. and J. NOBLE, Seedsmen, 152, Fleet-street, London.

Edinburgh, November, 1845.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to the inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their Manufactory.

THE TANK SYSTEM.

BURBIDGE AND HEALY having heated a considerable number of Pits and other Horticultural Structures, for the cultivation of Pines, Melons, Cucumbers, and other tropical plants, particularly upon the plan recommended in Mr. MILLS's recent work on the Culture of Pines and Cucumbers, many of which are working at the present time, prove beyond a doubt that every kind of structure may be heated by BURBIDGE and HEALY's peculiar Tank Apparatus, with the absolute certainty of producing the desired result. Their Apparatus may be seen at work at the following places:—Horticultural Gardens, Chiswick; Royal Botanic Gardens, Kew; Baroness Rothschild's Gardens, Gunnersbury; Mr. Glendinning, Chiswick Nursery; Messrs. Henderson, Pine-apple-place; and in more than one hundred other places.—150, Fleet-street, London.

HOT WATER APPARATUS.—The attention of Architects, Builders, and others, is respectfully requested to BENJAMIN FOWLER's superior method of Heating Churches and Chapels, Halls, Stair-cases, Conservatories, Forcing and Greenhouses, Manufactories and Warehouses, Kilns, Rooms for Drying Timber, &c., and every variety of purpose for which artificial heat is required. Within the last 20 years some hundreds of buildings have been heated upon this plan, and the parties for whom they were executed are constantly expressing their satisfaction, also their willingness to vouch for their efficiency. An improved wrought-iron boiler, which requires no brickwork, may be seen in action upon the premises.
BENJAMIN FOWLER, 63, Dorset-street, Fleet-street.

EXHIBITIONS AT THE GARDEN
OF THE
HORTICULTURAL SOCIETY OF LONDON,
FOR THE YEAR 1846.

THE EXHIBITIONS will take place on the SECOND SATURDAYS in the months of MAY, JUNE, and JULY.

MEDALS AND REWARDS.—The Society distributes the following Medals and Rewards; namely—

C. The Certificate	value—£0	10	0	SG. Large Silver Gilt Medal	value— £4	0	0
SB. Silver Banksian Medal	1	0	0	GB. Gold Banksian Medal	7	0	0
SK. Silver Knightian Do.	1	5	0	GK. Gold Knightian Medal	10	0	0
LS. Large Silver Medal	1	15	0	LG. Large Gold Ditto	20	0	0

Class I.—FLOWERS; for which Nurserymen and Private growers exhibit independently of each other.

A Pelargoniums: in collections of 12 new and first rate varieties, cultivated with superior skill, in 8-inch pots. GB—SG—LS

B Pelargoniums: in collections of 12 varieties, in 8-inch pots. GB—SG—LS

C Pelargoniums: in collections of six varieties, in 11-inch pots. LS—SK—SB

D Roses, in pots: Amateurs to show in collections of 12, Nurserymen in collections of 18, distinct varieties. GB—SG—LS

NB. The Judges are required to disqualify any collection which shall be found to contain a plant which has been recently placed in the pot from the open ground.

E Roses, in pots; single specimens displaying superior cultivation. SK—SB—C

F Moss Roses in loose bunches, each consisting of three trusses as they are gathered, so as to exhibit, as far as possible, the habit of the variety: in 12 varieties. SK—SB—C

G Other Roses, exhibited as in the last letter, and in 50 varieties. LS—SK—SB

NB. No one who exhibits in this letter can also compete in the following.

H Other Roses, exhibited as in the latter F, and in 25 varieties. SK—SB—C

NB. Higher Medals than those here offered for Roses cannot be given by the Judges: and if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to compete.

I Cape Heaths; in collections of 20 entirely distinct varieties. GK—GB—SG

NB. It is expected that the same plant shall not be exhibited on more than one occasion.

K Cape Heaths: in collections of 12 entirely distinct varieties. GB—SG—LS

L Cape Heaths: in collections of six entirely distinct varieties. SG—LS—SK

NB. No person will be allowed to show in more than one of the classes *I*, *K*, and *L*.

M Cape Heaths; single specimens displaying very superior cultivation. LS—SK—SB

N Calceolarias, in sixes; in 8-inch pots. LS—SK—SB

O Carnations, in pans of 24 distinct varieties. LS—SK—SB

P Picotees, in pans of 24 distinct varieties. LS—SK—SB

Q Pinks: in pans of 24 distinct varieties. SK—SB

R Ranunculuses, excluding Turbans; in stands of 12 distinct varieties for private growers, and 24 for Nurserymen. LS—SK—SB

Class II.—FLOWERS; for which all persons are admitted to equal competition.

S Stove or Greenhouse plants; in collections of 40 plants. LG—GK—GB

NB. Calceolarias, Fuchsias, Orchidaceæ, and Pelargoniums to be excluded from *S*, *T*, *V*, and *W*.

T Stove or Greenhouse plants; in collections of 20 plants. GK—GB—SG

NB. Exhibitors cannot show in more than one of the classes *S*, *T*, *V*, and *W*.

V Stove or Greenhouse plants; in collections of 12 plants. GB—SG—LS

W Stove or Greenhouse plants; in collections of six distinct species. SG—LS—SK

X Greenhouse Azaleas; in 12 distinct varieties. GB—SG—LS

Y Greenhouse Azaleas; in six distinct varieties. SG—LS—SK

NB. No one can show in both classes of Azaleas.

Z Collections of New Hardy Evergreens in pots: LS—SK—SB

AA Exotic Orchids; in collections of not fewer than 20 species. LG—GK—GB

NB. Exhibitors cannot show in more than one of the classes *AA*, *BB*, *CC*.

BB Exotic Orchids; in collections of 12 species. GK—GB—SG

CC Exotic Orchids: in collections of six species. GB—SG—LS

DD Scarlet Pelargoniums; in six distinct varieties, in pots not less than 11 inches in diameter. LS—SK—SB

EE Pelargoniums: in six DISTINCT SPECIES. SG—LS—SK

NB. By the word species is meant the wild kinds imported from the Cape of Good Hope, or New Holland, tuberous species inclusive, and not garden cross-breds.

FF Achimenes; in collections of six species, grown in pans not less than a foot in diameter. LS—SK—SB

GG Distinct varieties of Tall Cacti in flower. GB—SG—LS

NB. The GB and SG Medals are not to be given if fewer than six varieties are exhibited.

HH Fuchsias; single specimens. SK—SB—C

NB. No person can receive more than one prize under this head.

II Hardy Orchids in pots, in collections; exclusive of Cypripediums. SK—SB—C

KK Hardy Cypripediums. SK—SB—C

LL Hybrid Alstrœmerias; cut specimens. LS—SK—SB

MM Statices; in collections of six species. SG—LS—K

NN New or extremely rare ornamental plants. SG—LS—SK

NB. These Medals will be awarded by the Society's Officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. *Nothing will be regarded as new which has been exhibited in the Garden in a previous season.*

OO Single specimens of very superior cultivation. SG—LS—SK

PP Miscellaneous subjects. SK—SB—C

NB. Exhibitors under *PP*, will not be thereby *entitled* to a pass ticket. Cockscombs, Heartsease, Hydrangeas, and bouquets, are altogether excluded from exhibition.

RR Seedling Florist's flowers. SK—SB—C.

NB. Every seedling must be shown singly, and marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than 6 seedlings at each meeting. Exhibitors under this head will not be thereby *entitled* to a pass ticket. For seedling Pelargoniums exhibited the first year no higher prize shall be given than a certificate, and this is to be awarded to flowers of decided merit. Seedling Pelargoniums of the second year must be shown in pots not smaller than 32s, and each exhibitor may produce 6 of them, but not a larger number.

IN ADDITION to any Medals assigned to the classes, *I*, *S*, *T*, and *AA*, the SK, SB and C are offered for the collections in those classes which shall be best named by the Exhibitor.

N.B. The Society's Officers, who will make this award, will be guided in their judgment by a consideration not only of the correctness of the names, but of the accuracy of the spelling, and the neatness of the writing.

Class III.—FRUIT; for which Market Gardeners, Fruiterers, or Persons in the habit of regularly supplying the Market, and Private Growers, exhibit independently of each other.

N.B. All Fruit must be FULLY ripe and WELL COLOURED, and PROPERLY NAMED by the Exhibitor as far as practicable; if the contrary, it will be disqualified.

SS Miscellaneous collections of fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind. GK—GB—LS

NB. Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter. Exhibitors of collections of Fruit should bear in mind that however fine one or two of the kinds in this collection may be, they cannot gain a prize unless they furnish at *least* three different kinds of fruit of *first rate quality*.

TT Grapes. SG—LS—SK—SB

VV Pine Apples. SG—LS—SK—SB

WW Peaches or Nectarines, in dishes of six specimens. SK—SB

XX Other kinds of fruit. SK—SB—C

SMITH AND CO.

ESTABLISHED NINE YEARS.

HORTICULTURAL BUILDERS, HOT-WATER APPARATUS, AND GENERAL GARDEN FURNITURE MANUFACTURERS:

GLEBE PLACE, FACING KING'S PARADE, KING'S ROAD, CHELSEA, LONDON.

FOUNTAINS, VASES, FIGURES, &c. &c., IN GREAT VARIETY.

CONICAL BOILERS.—These excellent Boilers, invented by JOHN ROGERS, Esq., are made of various sizes by JOHN SHEWEN, Ironmonger, Sevenoaks. They are applicable to all kinds of apparatus, and are in use at Messrs. Loddiges', Hackney; Messrs. Chandler's, Vauxhall; Messrs. Rollisson's, Tooting; Mr. Pontey's, Plymouth, Mr. Henderson's Pine-apple-place; and in the Horticultural Society's Gardens.

THE FARMERS OF GREAT BRITAIN are requested to read the pamphlet on "GYPSUM, AS A MANURE;" describing its various important uses for Agricultural purposes, with full and plain directions for its application, and containing an account of numerous cases of its surprising efficacy and cheapness.

The Pamphlet will be sent free to any part of the Kingdom, on receipt of a post-paid application (containing Three Penny Stamps), addressed to NEWTON and PECK, Hull.

NOW READY.

NEW EDITION OF DR. LINDLEY'S SCHOOL BOTANY.

Demy 8vo, with numerous Alterations, and nearly Four Hundred Illustrations, price 5s. 6d.,

SCHOOL BOTANY;

OR,

THE RUDIMENTS OF BOTANICAL SCIENCE.

BY JOHN LINDLEY, Ph.D., F.R.S.,

PROFESSOR OF BOTANY IN THE UNIVERSITY COLLEGE, LONDON.

[SPECIMEN OF THE WORK.]

Fig. CCXLI.

Egyptian mummies. Its branched ears are very remarkable.

SECALE.

Glumes subulate. Spikelets 2-flowered, with the rudiment of a third flower in the middle. Otherwise like Triticum.

1. S. *Cereale* (*Rye*). Glumes shorter than the spikelet. Rachis tough. ——— *Fields.* The grain of this sort of corn produces flour inferior to that from wheat, and forming a dark sweet nutritious bread. It is the common food of the peasantry of Germany, but is little used in England.

*** Rye differs from Wheat in having very small narrow glumes, and the centre floret of each spikelet constantly imperfect.

HORDEUM.

Spikelets in pairs or threes, 1-flowered. Glumes 2. Paleæ 2, the lower awned at the apex. Scales obtuse, fringed. Styles feathery. Ovary villous at the end.

1. H. *hexastichon* (*Six-rowed Barley, Winter Barley, Bere, or Bigg*). Spikelets all fertile, arranged in 6 rows. Grain adhering to the paleæ. ——— *Fields.*

2. H. *distichum* (*Two-rowed or common Barley*). The middle spikelets only fertile, the two lateral of each cluster barren and beardless. One palea of the middle florets furnished with a very long awn. Grain adhering to the paleæ. ——— *Cornfields.* This is the sort of barley commonly grown in England. It prefers light land. Bread is sometimes made from its flour; but it is chiefly used for malting, previously to being fermented for beer. Malt is the grain of barley forced to germinate, by which it acquires sweetness, and then kiln dried.

3. H. *murinum* (*Wall Barley*). Lateral flowers barren. Glumes of the intermediate ones lanceolate, fringed. Grain adhering to the paleæ. ——— *Walls and waste places.* A worthless weed.

*** Barley differs from Rye, which it somewhat resembles, in having its spikelets one-flowered only, and constantly

Fig. CCXLII.

Fig. CCXLI. Hordeum distichum with 3 spikelets separate, of which the two lateral are sterile, and the central only perfect.
Fig. CCXLII. Secale Cereale with a spikelet separate.

umbel, while the involucels at the base of the partial umbels consist of many bracts.

The manner in which flowers are arranged is called their *inflorescence*. It is a sort of branching, and has different names, according to the manner

Fig. XXXVII.

Fig. XXXVIII.

Fig. XXXIX.

in which the branches are arranged. The principal kinds are these:—1. The *capitulum*, or *flowerhead*, when all the flowers are sessile upon a broad plate called a *receptacle*, as in the Daisy (Bellis perennis). 2. The *umbel*, when the pedicels all radiate from one point, as in the Cherry (Fig. XL.); this is called compound, when each ray of the umbel is itself umbellate, as in the Fool's Parsley (Æthusa Cynapium, Fig. XXXIX). The *spike*, when the flowers are sessile along a common peduncle, or axis, as in Ribgrass (Plantago lanceolata). 4. The *raceme*, when the flowers are all stalked along a common axis, as in the Currant. 5. The *corymb*, when the flowers of a raceme are all on the same level, as in Candy Tuft (Iberis). 6. The *panicle*, when the pedicels of a raceme are themselves branches, as in the Fiorin Grass (Agrostis stolonifera). 7. The *cyme*, when a panicle is corymbose and irregularly contracted, as in the Elder-tree (Sambucus nigra, Fig. XLI.) A *spadix* is the inflorescence inclosed in a spathe (Fig. XXXVIII.); an *amentum*, or *catkin*, is a

SATURDAY, DECEMBER 13, 1845.

MEETING FOR THE FOLLOWING WEEK.
TUESDAY, Dec. 16—Linnean . . . . 8 P.M.

DO THE RACES OF PLANTS WEAR OUT? Is it true that when a tree or other perennial plant becomes unhealthy from old age all the offspring previously obtained from it by cuttings in all parts of the world becomes unhealthy too? Is such a doctrine a reasonable inference from known facts? or is it forced upon us by evidence although not deducible from mere reason? This is an important question, to a laboured advocacy of which pamphlets and newspapers have been lately abundantly brought into requisition. We have ourselves adverted to it incidentally, and on the present occasion propose to consider it in its various aspects.

1. No one pretends that the species of plants disappear. It is alleged on the contrary, that seeds renew the languid vigour of a species as often as they are sown; and that if an unhealthy plant is multiplied from seeds the immediate offspring becomes healthy. It is also said that multiplication by seed is the only natural mode of propagation known among plants, and that all other kinds of increase are artificial and lead to debility.

It would, we think, be difficult to find an hypothesis more entirely at variance with notorious facts. That propagation by seed is *a* natural method of multiplication is doubtless true; but to say that no other natural means exist is absurd. The Sugar-cane is rarely propagated by seeds; its natural mode of propagation is by the stem, which when blown down by the storm emits roots at every joint. Of this natural property man has availed himself as a means of artificially extending the plant. The Tiger Lily naturally propagates itself by bulbs, formed in the bosom of its leaves; we never saw it form a seed. The Jerusalem Artichoke naturally multiplies itself by its tubers, which are bodies of the same nature as the so-called root of a Potato; no one ever saw it produce seed in this country. Every gardener knows that his Achimenes are principally multiplied by little scaly bodies resembling tubers, and that these are formed in such abundance as to render seed unnecessary. In short we have not space for other instances of this, the denial of which could only arise from an entire unacquaintance with common facts. These examples sufficiently show that Nature does provide other means of propagating plants than seeds, and that tubers are one of those means.

As to the assertion, that all other means than multiplication by seeds lead to debility, we must ask for the proof. The wild Strawberry has been more propagated by its runners than by its seeds: and where do we find any sign of debility there? The Jerusalem Artichoke was introduced before the year 1617; for nearly two centuries and a half it has increased itself entirely by tubers, and never by seed. Does any one find debility in that plant? Couch Grass increases chiefly by its creeping roots; we wish we could adduce, at least, that one instance of failing vigour in a plant whose seeds are but little yielded. It, therefore, is not true that plants multiplied much, or wholly, by other means than seeds become on that account unhealthy.

d Seeds, however, are said, in all instances, to produce healthy plants. But this, like the previous assertions, will not bear exact investigation. The health of a seedling depends entirely upon that of the seed. Under no circumstances will unhealthy seeds yield vigorous offspring; this is proved every day by what comes from grain debilitated by age. And there cannot be found a gardener, of any large experience, who does not know that seedlings will exhibit every diversity of constitution from health to decrepitude. Of the latter, MYATT's Pine Strawberry is a modern and striking instance.

We, therefore, regard the whole string of propositions now examined as entirely destitute of all foundation in fact.

2. What are called the varieties of plants are said to wear out. It is maintained that vegetable, like animal life, has its fixed periods of duration, and that there is a time beyond which the debility incident to old age cannot be warded off. The inference from this is, that all the cultivated races of plants require to be incessantly renewed by seed, in the absence of which precaution they gradually become unhealthy, and unfit for cultivation.

The first person who proposed this theory was the late Mr. KNIGHT, who, in the latter part of the last century, finding that the orchards of Herefordshire no longer contained healthy trees of certain varieties of Apple, which were said to have flourished 50 years before, and failing in his attempt to restore health to such varieties by grafting, assumed that old age had overtaken them, and that they were incurable. Thence he extended the theory to all other plants; and here and there writers on vegetable physiology, rather out of respect to Mr. KNIGHT's great name than from any correct examination of the facts for themselves, have blindly adopted his views. But reason and evidence are alike opposed to the conclusion, which seems to have sprung out of a mistaken application of the laws of animal life to that of vegetables, and a desire to push analogy beyond its proper limits.

All who understand the nature of plants, and the manner in which they grow, and have witnessed that incessant renewal of their vitality with which Providence has so wonderfully endowed them, would hesitate to adopt Mr. KNIGHT's views except in the presence of facts capable of no other possible interpretation. No physiologist can separate the nature of what gardeners call varieties (of course mules are not here included), from that of a wild race. In their intrinsic qualities they are the same. It can make no difference in the nature of a plant whether it is sown by a gardener or by winds, birds, animals, or other agents. The Oak which springs up in a forest is not in the smallest physiological particular different from that which rises from the bed of a nurseryman. The Cabbages which load the waggons of a market gardener are in their essence the same as those which sprout forth from the sea-beaten cliffs of the ocean. They may be greener, or redder, more succulent and larger; but they are physiologically the same. We therefore must dismiss from our argument the word variety, which only leads to a confusion of ideas. Now, wild perennial plants, whether woody or herbaceous, whether forming a trunk or a mere permanent root, have never yet been shown by any trustworthy evidence to be subject to decrepitude, arising from old age. On the contrary, every new annual growth is an absolute renewal of their vitality, in the absence of disturbing causes. Hence the enormous age at which trees arrive. A thousand years is still youth to a forest tree which no accident has injured; and there is no intelligible reason why it should not, if guarded from violence, continue to grow to eternity. It is very true that plants do in reality perish commonly without attaining any such longevity; and that constitutional feebleness is notoriously one of the accompaniments of advancing age. But this arises from external, not intrinsic, causes. The soil which surrounds them is exhausted, their roots wander into uncongenial land, water in unnatural excess is introduced, the food they require is withheld, violence rends them, men mutilate them, severe cold disorganises them, and these and other causes produce *disease*, which may end in death. But this is very different from dying of mere old age; and for practical purposes it is most material to draw the distinction.

If no evidence exist to show that wild plants suffer from mere old age, we cannot admit such a property to be incident to those which are cultivated. It would indeed be a waste of space, which we can ill afford, to dwell further upon this part of the argument.

What are called facts, the real value of which we shall presently discuss, have been adduced to prove that if plants do not die of old age in a wild state, yet that they incontestably do wear out when artificially multiplied by division. In opposition to this it is sufficient to quote the White Beurré Pears of France, which French writers assure us have been thus propagated from time immemorial, and which exhibit no trace of debility; or the Jerusalem Artichoke already named; or the cultivated Vines of which the very varieties known to the Romans have been transmitted by perpetual division, but without deterioration or decrepitude, to our own day. The *Vitis præcox* of Columella is admitted y Dr. HENDERSON, on the authority of the most trustworthy writers, to have been the *Maurillon* or *Early Black July* Grape of the present day; the *nomentana* to have been the German *traminer*; the *græcula* the modern Corinth or Currant; and the *dactyli* our *Cornichons* or *Finger* Grapes.

But it is affirmed that some cultivated plants have really worn out. The Redstreak, the Golden Pippin, and the Golden Harvey Apples are among the number quoted. The first of these is little known to us, and we have no evidence about it: but the Golden Pippin and Golden Harvey are certainly not capable of being employed in support of Mr. KNIGHT's theory. Both are to be found in various places at this moment in as perfect health as they ever enjoyed. The Golden Pippin is among the most vigorous Apples of Madeira; the Golden Harvey is in all good gardens. Of the former, healthy trees were many years since shown to exist in Norfolk, in warm dry places it has no particular appearance of suffering. Recruited by the fine climate of France, the Golden Pippin has been received back to this country in as healthy a state as ever, and is now growing in the Garden of the Horticultural Society. The old Nonpareil was well known in the time of Queen ELIZABETH; in cold places it cankers, and no doubt always has cankered; but what can be more healthy than that variety in favourable places? In short, what is called evidence breaks down wherever it is examined; and the argument about the wearing out of races proves to be baseless.

"We may easily conceive," says DE CANDOLLE, "that every cultivated variety owed its origin to some special circumstance, which once occurred, and but once. In such a case the variety has been multiplied by division, and every plant so obtained from it has been a portion of the same individual; which accounts for their all being exactly like each other. An identity of origin in all the plants of the same variety has led some physiologists to imagine that these varieties or fractions of an individual might die of old age. This was founded upon circumstances observed by Mr. KNIGHT with regard to the Golden Pippin. But it appears to us difficult to admit, upon such a single fact, an hypothesis opposed to all other facts. That varieties will last, so long as man takes care of them, appears to be proved by many of them having been preserved from the most remote periods. But it is also certain that negligence will cause some to disappear, just as accident or industry brings others into existence."—(*Phys. Végétale*, p. 731, somewhat abridged.)

Although an examination of evidence leads us to the inevitable conclusion, that the wearing out of the races of plants by old age is a delusion, yet we are far from denying the accuracy of the statements made by some recent writers on this subject. We may admit their facts, but reject their reasoning, and protest against the inferences they would have us draw. This, however, involves most important practical considerations, which we must defer till another week. In the meanwhile, we would refer our readers to some very just remarks, by Mr. GARDEN, of Glenae, in the *Farmers' Gazette* of Nov. 29, an Irish paper, conducted with talent and intelligence, and, in those qualities, offering a striking contrast to its rival, the *Irish Farmers' Journal*.

ADVICES from Mr. FORTUNE, dated Shanghae, August 16, mention that he had returned from the river Min, and was busily engaged in gathering together his collections of plants left at Ningpo, Chusan, and other places, preparatory to his return to England, where he is expected in April or May next. His plants are described by him as being extremely valuable; and he had decided upon bringing the whole of them home under his own superintendence.

He had been in the Black Tea country, and had witnessed the processes of preparing the leaves; he had been seriously ill with fever, from which he was recovered; and on his passage from the Min to Chusan, he had been twice attacked by pirates, who, however, were on each occasion driven off by himself, unassisted by his cowardly Chinese crew.

WE have been requested by several correspondents to state what kinds of FOOD may be used instead of Potatoes. In order that an efficient substitute be provided for any kind of food in general use, it is necessary that the nature of foods generally be understood. Chemical and physiological science have succeeded in pointing out the fact that there are two great classes of secretions elaborated by the vegetable kingdom that are essential to the food of man and of all other animals. The one class of these secretions contains carbon as a distinguishing ingredient, and may be called *carbonaceous*; the other, in addition to carbon, hydrogen, and oxygen, contains nitrogen, and is called *nitrogenous* or *azotized*

The first class is taken into the stomach as food, and being carried into the blood, meets there with oxygen gas, unites with it, forms carbonic acid gas, and, during this process, gives out heat. This is the source of animal heat. Unless this heat is developed in due quantities, the animal perishes.

These secretions and their composition are as follows:—

	Carbon.	Hydrogen.	Oxygen.
Starch	12	10	10
Sugar	12	9	9
Oil of Fat	11	14	1

These substances enter largely into the food of the whole animal kingdom. Starch is contained in the seeds of most plants, as of the Wheat, Barley, Maize, Rice, &c., and in the various other parts of plants used as food by man. It can easily be separated from plants, and is done so for use as food, in the form of tapioca, arrow-root, Potato-starch, Wheat-starch, sago, &c. Sugar is also separated from the sap and fruits of plants, in which it is so generally contained. Oil is secreted by, and separated from, a number of plants, as the Olive, Almond, &c., and is also formed from starch and sugar by the animal, and deposited in its body in the form of fat.

The nitrogenous secretions are found not only in plants but in animals. The fact is, they are simply conveyed from the plant to the animal in its food, without undergoing any change. The nitrogenous secretions form the fabric of the body. Nerves, muscles, blood, &c., are principally composed of them. Their object in food is not the keeping up of animal heat, but the nourishment, the building up of the body. It is only as food contains these secretions that it is nutritious, that it can fulfil the demand for supply by the continual waste of the body in the actions of life. These secretions, though called by different names, as fibrine, albumen, and caseine, and varying somewhat in their physical properties, are modifications of one substance, *protein*. Protein is composed of 48 parts carbon, 36 hydrogen, 14 oxygen, 6 nitrogen. The other substances are easily convertible one into the other, and only vary in possessing different proportions of sulphur and phosphorus, in addition to the elements of protein.

In all the food man eats he requires that it should possess in one form or another these two classes of secretions. The carbonaceous secretions are constantly needed in all food, to keep up the heat of the body; the nitrogenous for building up its fabric. The quantity of the latter required depends on the waste going on in the system, and when this is great, as in severe bodily exertion of any kind, the demand for them will be the greatest. As an average, it has been stated that man requires 80 per cent. of carbonaceous matters, and 20 per cent. nitrogenous. This is about the proportion of such secretions found in Wheat flour, and it is undoubtedly this relation of the two classes of alimentary matters that render it the staple food of man in so large a proportion of Europe. Of other things eaten as food by man and animals, the following Table, from Dr. Playfair, gives the relative quantities of carbonaceous and nitrogenous matters:—

100 parts contain—

	Water.	Nitrogenous Matter.	Carbonaceous Matter.	Ashes.
Peas	16	29	52	3
Beans	14	31	52	3
Lentils	16	33	48	3
Oats	18	11	68	3
Barley	16	14	69	2
Potatoes	72	2	25	1
Turnips	89	1	9	1

It will be seen from this list how low in the scale of nourishing and respiratory elements the Potato stands. It does not contain more than a fifth of the nutritive matter of Oats, a tenth of Wheat, and a fifteenth of Peas, whilst its carbonaceous or respiratory elements are not more than one half of those seeds. It will be found, then, that although Potatoes are cheap, yet in as far as they serve the purpose of food they are really as dear as any other article on the list. If Potatoes are a penny a pound and bread two-pence halfpenny, which is about the price they are in London just now, bread containing 10 times the quantity of nitrogenous matter, and twice the quantity of carbonaceous matter, is the cheaper article of diet. Bread, then, under such circumstances, may be successfully substituted for Potatoes. But there are other articles on this list cheaper than Wheat and its flour. Peas may be obtained at 6*s.* a bushel, half as cheap as Wheat, and contain 15 times the quantity of nutritious matter found in Potatoes. A pound of Peas at 1*d.*, and a pound of Tapioca at 4*d.*, would contain as much alimentary matter as 15 lbs. of Potatoes.

The flesh of animals is composed chiefly of protein (fibrine), and is consequently more nutritious than vegetable food. It needs, however, carbonaceous matter with it, and this is the reason that Potatoes, and other vegetables containing starch, are so frequently eaten with it. The Tables in the *Athenæum*, in the review of an absurd book recommending a vegetable diet, referred to by "Veritas," in the *Gardeners' Chronicle* of November 22, are not now to be relied on, as they contain no distinction between carbonaceous and nitrogenous principles, and are in many points evidently incorrect. With regard to the use of blood as food, there can be no doubt of its being available for this purpose. It contains about 10 per cent. of protein, which, by proper cooking, may be made as available to the system as any other kind of food.

In the above Table there are one or two substances omitted, which might be used as food. Maize has a composition closely resembling Oats and Barley. It contains more oil than either; and thus, in proportion to its protein, more carbonaceous or combustible matter than either of those grains. It is the food of a large class of the community in America, although they prefer feeding pigs on it, and thus obtaining its protein and oil second-hand, in the form of pork. It may be obtained in London at about two-thirds of the price of Wheat. Rice is another grain used as food. It contains only two per cent. of protein, and in this respect is not more nutritious than the Potato itself. It could only be the food of an indolent people, unless it was eaten in the quantities that Potatoes are in Ireland. It would, in this way, be a very expensive substitute for the Potato.

There is a class of foods which are not often eaten in this country on account of their presumed indigestibility, which, however, when cooked properly, are not exposed to this objection, viz., Nuts which might be eaten. All the forms of Nuts, as the Walnut, Chestnut, Cocoa Nut, &c., contain large quantities of oil and also starch, and protein. On account of their price, there is but one of these which could be used extensively in this country, and that is the Cocoa Nut. This Nut is the entire support of the inhabitants of many countries where it grows. It may be purchased in Ceylon at the rate of 12*s.* per 1000. The cost of carriage could not be much, and they might, therefore, become a cheap article of diet. The average amount of meat in the Nut is about 10 ounces, but we have no accurate analysis of its composition, so as to be able to compare it with Potatoes or other foods. We have recently heard of a gentleman in England who has lived on these Nuts for a twelvemonth, and who finds himself in stronger and better health than ever he was in his life. This proves that such things might be eaten with safety, was there need.

Amongst the carbonaceous and nitrogenous substances used as food, there are two, *gum* and *gelatine*, which resemble the others in composition, the first belonging to the carbonaceous and the last to the nitrogenous class, but which either do not enter the blood at all, or when there do neither serve to keep up the animal heat nor to build up the fabric of the body; gummy and gelatinous substances, therefore, cannot become substitutes for the other forms of carbonaceous and nitrogenous matter. Gelatine is found abundantly in the growing parts of animals, in the skin, in the bones, and cartilages; and these parts of animals are used for making soups, jellies, &c. It should, however, be remembered that although gelatine contains nitrogen, it does not contain protein, and it is questionable as to whether it can in any way be used as a nutritious agent. The experiments of the French Commission satisfactorily proved this. Dr. Buckland is therefore wrong when he states that bread made with powdered bones, which contain gelatine, is more nutritious than before; nor is bone-broth so nutritious as it has been sometimes regarded.—*L. E.*

* Nearly all bad, and many sold at nominal prices.

HEATING AND VENTILATING.

[Fourth Notice.]

There can be no question that we are as yet totally unacquainted with the effects which may be produced upon vegetation by the adoption of a more comprehensive and complete system of ventilation than has hitherto been considered necessary. Dr. Lindley, and other writers on vegetable physiology and pathology, have attributed much to the effects which an atmosphere kept in constant motion has on plants cultivated under glass. That benefit to some extent does result from keeping the air of the house in motion will not be disputed by those who have reflected at all on this subject. Hence the importance of further inquiry into the matter. Anything, in fact, which throws the least ray of light on the better cultivation of plants under glass deserves and demands our attention and investigation, although it must be admitted that we have few data to guide us in the inquiry; at least nothing conclusive as to the actual amount of benefit resulting to plants cultivated under such circumstances.

In hothouses of large dimensions, the difficulty has always been how to produce something approaching a natural atmosphere. A bad arrangement of the heating apparatus, and incomplete ventilation, have marred this desirable object.

Any system, therefore, of ventilation, that can be devised, calculated to avert or modify such misfortunes must, I apprehend, be acceptable to every one interested in gardening. Practically, we have always found plants thrive much more luxuriantly in small than in large houses, and with much less trouble. The interchange of atmosphere constantly going on, and the motion in which it is continually kept, from being thus circumstanced, is a tolerably clear proof of the immediate cause of the healthiness of plants in such houses; and there is one other reason also equally clear, that the inequality of temperature in such buildings is manifestly inconsiderable, compared with buildings of large dimensions. In houses constructed like that which the accompanying woodcut represents, the pipes are usually carried immediately round the inside of the front wall. The heat, therefore, passes up under the glass until it reaches the highest part of the building, that part generally being intolerably hot. The great body of air in the centre of the house remains stationary, and does not participate in the heat thus given off from the pipes to the extent intended or supposed. This is accounted for by the greater density of the air; and from this fact also it is likely to remain stationary, because the means usually employed to heat or cool the house cannot, from the arrangement in most cases adopted, drive it from its position. Nothing can be more certain than that plants in such buildings, where the heating and cooling powers are so applied, must suffer considerably. Now, the point we have arrived at is to change the position of the cold air, constantly and rapidly, either by the admission of external air in hot weather, or by some other contrivances, so as to mingle with promptitude and certainty the cold and hot air within the building. This can certainly be accomplished, because of the unequal gravity of the inclosed atmosphere in different parts of the house, provided means are introduced by which one of the simplest laws of nature will come into full and active operation.

In the annexed woodcut, the coldest part of the house is at A, and, of course, the air is heaviest at that place. A drain, therefore, communicating with B B, would at once set the atmosphere in motion in the direction indicated by the arrows, provided an artificial temperature was kept up by means of the heating apparatus. During summer, when artificial heat is unnecessary, I would open valves having communications to them from those air-tunnels at C C, to admit the external air, which would invert the direction of the current, as is now shown. An impulse would thus be given, not only in winter, but in summer also, by the colder air to the hotter, thus keeping the atmosphere constantly excited and in motion, besides equalising the temperature throughout the entire building. To attain satisfactorily these two most important points in the construction and heating of large buildings designed exclusively for the culture of plants, is indeed very desirable; that is, to equalise the temperature, or render it more uniform over a large building, and at the same time, by thus intermingling the cold and hot air, to keep it always in motion. This subject is deserving of further discussion, for there cannot be a doubt that much of the successful issue of these large buildings depends upon the right application of the principles involved in the present communication.—*R. Glendinning.*

THE AMATEUR GARDENER.

Nor does he govern only or direct,
But much performs himself. No works, indeed,
That ask robust, tough sinews, bred to toil,
Servile employ; but such as may amuse,
Not tire, demanding rather skill than force.
COWPER, *The Garden.*

GARDENING, in all its branches, demands the exercise of an active industry, and as much self-denial as an industrious habit will be willing to practice. By self-denial, I mean that which is deemed such by the luxurious or the slothful, and by the very large class of persons who have an abhorrence of labour. To those who exercise it, it becomes a source of a high degree of pleasure; so much gratification, indeed, is afforded by the toils of gardening, that we have long entertained a conviction that corporeal labour is a natural provision for man's happiness. When intellectual pursuits alone are followed, or when life is spent in a round of easy and fashionable employments, it will be found that a healthy state is rarely maintained. But field sports and husbandry, and gardening, seem necessary to those who have not to labour for a subsistence, and are admirable preventives of sickness, and set *ennui*, and dyspepsia, and hypochondriasis, at defiance.

I have heard of some devotees of Flora, who have taken the blankets off their beds to preserve their favourites from the destructive influence of some unexpected frost. We generally laugh at such conduct, and call it enthusiasm or folly; and most persons would be unwilling to get up in the night to protect a collection of flowers. But, happily, ridicule is not the test of truth, and I am of opinion that the amateur who would occasionally deny himself sleep or a blanket, rather than lose a choice flower, has reason on his side. Let us see who those are who would jeer at such a course, and it will be easy to employ against them, with success, the *argumentum ad hominem.* One of them may be a lover of hunting, and he would not refuse to pass a sleepless night to save the life of a sick horse; another may be a prosperous man of business, who would turn night into day to execute a profitable order. Things become valuable, because skill, and time, and labour, are expended on them, and money is only the exponent of that expenditure; if, therefore, a florist has devoted his energies to some plants during the summer and autumn, they have a money value to him, if not to others, and he is as reasonable in making sacrifices to preserve the product of his toil as any other man. I have mentioned an extreme case to illustrate my principle, that labour and self-denial are demanded in floriculture. In the cold evenings of winter, the greenhouse, the frames, or the window plants, must not be forgotten. If you have love enough for your pursuit to leave a cheerful fire in the evening, and throw down your cigar, to cover up that which you know will require protection before morning, you have then the right degree of enthusiasm, and may be admitted to a fellowship in the Royal Society of Philosophic Gardeners.

How often have I been vexed and ashamed of myself when a love of ease has led me to give up to the chances of a bright starry night in the winter, some pots of flowers which have only been placed in the open air to catch the influences of a day unusually mild. Indolence has suggested, "It will not freeze;" and the pots have been left till the morning. Then the penalty is paid for sloth, when a collection of Chrysanthemums, for instance, which have been attended to daily for six months, hang their beautiful heads in hopeless prostration! Whole greenhouses have sometimes been given up in this way to the blasting of the frosty king. The night being mild, no fire has been kindled. Towards morning there has come a nipping frost, and glazed every leaf and succulent branch in the house, and the only chance of safety has been in securing a gradual thaw, by matting up all the windows. The amateur has seen the fantastic figures of the frost upon his bedroom windows and known the position of his plants, but sleep has been too attractive for him. He flatters himself there will be time to prevent the mischief if he rise at the ordinary hour; but Phœbus gets the start of him, and pouring his golden rays upon the frozen leaves, irrevocably destroys them. In such cases we should ask ourselves which sacrifice is the greatest, that of self-denial, as it is called, which exhibits itself in a temporary disregard of ease and comfort, or that of self-reproach, which visits us as we look upon the permanent consequences of our neglect!

I have referred to what the devoted gardener must sometimes do, if he has not professional servants to do it for him; but such labours are only occasional, and may be often rendered unnecessary by forethought. The ordinary and every-day toil will be its own reward, and at length will become almost necessary to happiness. Even the winter season presents attractions to the true lover of gardening. A novice will find it shivering work at first, to go out on a dull, cold, November day, to look over the pots in frames, or to plant a new Strawberry bed. But let him persevere. Defend your feet with good waterproof coverings, and put on a stout gardening overall, and commence operations courageously. You will soon forget the cold; your cheeks will glow; your eyes and ears will open to a hundred sights and sounds which the denizen of the house knows not the existence of.

"No noise is here, or none that hinders thought.
The redbreast warbles still, but is content
With slender notes, and more than half suppress'd;
Pleased with his solitude, and flitting light
From spray to spray, where'er he rests he shakes
From many a twig the pendent drops of ice,
That tinkle in the withered leaves below.
Stillness, accompanied with sounds so soft,
Charms more than silence."—*Cowper.*

Away will fly all melancholy thoughts, and the season which some poets have spoken of as the funeral time of the year will develope an infinitude of nameless charms. From such healthful pursuits we return to the social circle with enhanced delight. We detail to the "gude wife," and to the "expectant wee things," the labours we have accomplished, and feel that the primitive curse has, by a kind providence, been turned to a blessing. Nor should the fair sex scorn such occupations, whenever the weather allows them to go forth. Let them see that their favourite tender Roses are defended from the coming winter; that plants of Thyme and Sage are provided with some temporary shelter against the blasts of the east, and in other ways either garden themselves or direct their gardeners, and if their cheeks do not mantle with a rosy hue I shall be sadly mistaken.

NAPOLEON PEAR.

Synonymes.—Médaille, Beurré Napoléon, Wurtemburg, Roi de Rome, Napoleon's Butterbirne, Suer Doré, and Charles d'Autriche (of some). Captif de St. Hélene.

This, the most succulent of all known varieties, was raised in 1808, by M. Liart, a vintner at Mons, who obtained, in consequence, a gold medal from the Pomological Society of Hennegau. Even after the last synonyme above enumerated became applicable, this Pear still retained the name of Médaille in some of the continental collections. The name it now bears was slowly adopted by those who suffered from their country having been made the battle-field of Europe, when in many instances the finest collections in Belgium were swept away or thrown into confusion by the Pioneers. The original tree of the variety in question was purchased at a high price by the Abbé Duquesne; and to him, according to Dittrich of Saxe-Gotha, it owes its memorable name of Napoléon.

Pale yellowish-green.

The accompanying outline represents a fruit of medium size. The skin is smooth, green when first gathered, gradually changing to pale yellowish green as it approaches maturity. The flesh is whitish, somewhat granular, but so exceedingly juicy that it cannot be cut without flowing. In using the fruit, a combination of the processes of eating and drinking must take place. Dr. Diel says that it is of "solchen saftfülle, dass man die frucht zu trinken glaubt." It is exceedingly rich and refreshing when obtained in perfection; but otherwise it is too watery. Usually ripens in November and December. It has a tendency to give way at the core, and must, therefore, be watched. The tree is vigorous, shoots olive green, with numerous distinct pale brown spots; buds prominent. Leaves broad, ovate, widely but not deeply serrated. Flowers remarkably large, with broad obovate petals, late in expanding. This ought to be in every good collection; and it rests with the cultivator to endeavour to render its most copious juice of that rich saccharine nature which it is known to possess when in perfection. It is best from a standard; and soil not over rich is of course preferable as regards flavour.—*R. T.*

THE CIRCULATION OF SAP.

A NEW theory having been proposed, at pp. 543, 560, by Mr. J. M. Goodiffe, of Granard, to account for the manner in which plants derive their nutriment; and attention having been invited to this theory, I take the liberty of making a few observations upon it. It is certainly praiseworthy in the highest degree, when a man thinks that his brethren are misled by a false doctrine, to set them right, if possible; yet, while I freely thank Mr. G. for his good intentions, I, at the same time, beg to differ from him in the opinions he has advanced, and I think he has not shown cause why we should abandon the theory of circulation. The conclusions derived from his premises are—"That plants absorb (essentially) water only from the soil by their roots, which is carried up the plant through its cellular tissue; that this water evaporates principally at the leaves, and that this evaporation is the cause of its ascent, the parenchyma remaining necessarily always saturated with water; that the other constituent parts of plants are conveyed to them in an aeriform state through the stoma into the vessels in a constant current, with a velocity and in quantity proportional to the demand and supply, and stimulating causes; that these gases are supplied by the air, but principally by a stream arising from the earth, of decomposing matters contained in it. That these gases, with the water contained in the parenchyma, and with heat, light, and electricity, act upon each other, and form the various matters found in plants; and that thus a return of the sap, in the general acceptation of the term, is not necessary, and does not take place." Mr. G. supposes that the notion of circulation in plants first took its rise in the fondness of the age for analogy, and to this cause he attributes the many errors which have attended the progress of botanical knowledge. I agree with him that we ought not to be led away, by lame analogies, from the true path of science; but after all, it cannot be denied that, considered in the abstract, there is a considerable degree of analogy in the functions performed by the principal organs in both kingdoms. We should not forget that it was this process of reasoning which first induced the late Mr. Knight to institute his experiments in hybridising plants; and the glorious results are too well known and appreciated by every lover of horticulture, to need any remarks here. It will be sufficient to state that, observing how the breeders of stock improve them by crossing, he instituted his experiments on plants; the result of which has bestowed upon us some of the most splendid flowers of which our gardens can boast, and conferred on man the important power of mellifying the works of Nature, and making them subservient to his purposes.

I think the principal error into which Mr. G. has fallen in his theory of circulation, lies in considering a plant to be a mere mechanical structure, the movements of which originate in light, heat, electricity, and other external agents; whereas these agents only assist in developing the vital principle. Dutrochet has clearly shown, by experiments, that the visible motions of plants are owing to an internal vital cause, brought into action by external agents, but not originating with those agents. It is the possession of this vital principle which enables plants to resist chemical action, to overcome the force of gravity, and, finally, it is the cause of all the changes which are constantly taking place in the vegetable system.

However painful and humiliating it may be to the proud philosopher to find that there are countless pages in Nature's book which he is not permitted to open—to feel the truth of the divine words, "Thus far shalt thou go, and no further," yet it is surely better to refer things at once to their proper source, and acknowledge our ignorance, than distract ourselves by false and shallow speculations. I am therefore of opinion with Du Petit Thouars, that the circulation of the sap is an inherent power derived from nature; and I have some slight notion that this is, after all, a more rational view to take of it than by referring it to purely mechanical means, such as condensation by heat, contraction of the cells, hygrometrical property of the silver grain, capillarity of the sap vessels, or, lastly, to evaporation, as Mr. G. supposes. With all these theories, excepting the last, I have nothing to do; they have been long since exploded; but Mr. G. says that evaporation by the leaves is the cause of the sap ascending; that it is as purely a mechanical action as a piece of linen hung out to dry. I think if such were the case, the absorption by the roots should always equal the evaporation from the leaves; yet we find that in sunshine, or very intense light, absorption is not equal to the evaporation; and if a plant, after losing weight in the light, be placed in a dark room or in the shade, then evaporation by the leaves will not keep pace with absorption by the roots, and the plant will become charged with fluid, consequently these two phænomena are not dependent on each other.

Mr. G. says that the circulation of the sap is explained by some experiments of Darwin, Knight, and others, when plants have taken up coloured infusions, and after those infusions have reached the leaves, a pale milky fluid is seen in vessels on the lower side of the leaves; and he asks, "What proof is there that these two fluids are identical? or, What proof have we of connexion between the vessels of the upper and lower side of the leaf, granting that such vessels exist?" I answer, that in our present imperfect state of botanical knowledge, there are many things yet undiscovered; and I am quite ready to admit, with Mr. G., "that physiological phænomena prove the existence of these vessels, but anatomical observation has not at all observed them;" but I do not at all agree with him that the only evidence for the existence of these vessels rests on the circulation of the sap, and that the circulation of the sap depends on the existence of these vessels; both these phænomena can be proved independent of each other. It would, indeed, be arguing in a vicious circle, as Mr. G. contends, if we reasoned thus: "A circulation of sap takes place, therefore there

must be vessels to convey it; and as there are vessels in plants, therefore a circulation takes place." But although we cannot prove the existence of phenomena as we would prove a proposition of Euclid, yet we may prove it by induction. If, for instance, Botanical physiologists having injected a colouring matter into plants, which they trace to their leaves on the upper side, and that, immediately after, a sensible addition takes place in colour or quantity to the cells at the under side, it is but reasonable to suppose that this addition has taken place by the matter elaborated in the upper side of the leaf, and transferred either through vessels, or by the cells possessing some permeable qualities which we are not able to discover. I may remark, however, that the fluid has been observed descending in its unaltered state, for De la Baisse caused a Euphorbia to pump up water coloured red; the fluid ascended in the wood, reached the leaves, tinged the latex, and spread from above downwards in the bark; and Schultz, of Berlin, succeeded on two occasions in repeating this experiment with the same result. Indeed, it is highly probable that, if the colouring fluid could be rendered free from objectionable matter, there would be no difficulty in attaining the same results. As a further proof of the circulation of the sap, I may adduce the testimony of Bertholet, who relates that the people of the Canary Islands tear off the bark of the poisonous Euphorbia Canariensis, and suck the limpid sap of the alburnum, which, in its ascent upwards, acquires none of the poisonous properties of the plant, but is in much the same state as when it entered the roots; whilst the descending sap of the bark, after it is elaborated in the leaves, is deadly poisonous.

To prove that certain vessels are destined for the conveyance of sap, I need only refer to Lindley's "Introduction to Botany" (a work, by the way, which I would recommend every young gardener to possess). The learned author (in the third edition, p. 298), treating of pitted tissue, thus writes:—

"Articulated Bothrenchyma, when it is collected together into hollow cylinders, serves for the rapid transmission of fluids in the direction of the stem; and it is well worth notice that the sides of the tubes of articulated Bothrenchyma, and their abundance, are usually in proportion to the length to which the fluid has to be conveyed. Thus, in the Vine, Phytocrene, the Cane, and such like plants, the pitted tissue is unusually large and abundant; in ordinary trees much less so; and, in herbaceous plants, it hardly exists." In the same page, treating of Pleurenchyma (woody tissue), the author thus writes: "That it is intended for the conveyance of fluids in particular channels seems to be proved; 1st, from its constituting the principal part of all wood, particularly of that which is formed in stems, the last in each year, and in which fluid first ascends in the ensuing season; 2d, from its presence in the veins of leaves where a rapid circulation is known to take place, forming in those plants the adducent and reducent channels of the sap; and 3dly, from its passing downwards from the leaves into the bark, thus forming a passage through which the peculiar secretions, may, when elaborated, arrive at the stations where they are finally to be deposited. Knight is clearly of opinion that it conveys fluid upwards or downwards, in which I fully agree with him; the power of cuttings to grow, when inverted, seems indeed a conclusive proof of this."

With the testimony of those eminent men before me, both as to the circulation of the sap and the existence of the vessels by which it is conveyed, I cannot think I am acting rashly in abiding by their views, at least until I see their experiments disproved by counter-experiments conducted with equal care and ability. I have refrained from alluding to special circulation or cyclosis which certainly cannot be explained on any known principle, but must be referred to the vital force; and I think any person reading the article on "Rotation," in page 391, of "The Introduction to Botany," and that on "Cyclosis" (page 393) will be convinced of the circulation of sap, unless, indeed, he be extremely sceptical.

I shall now proceed to examine the second part of Mr. G.'s theory. "That water alone is essentially taken up by the roots, and that, therefore the ascending sap contains no vegetable principles to be elaborated by the leaves." Mr. G. says that this hypothesis, namely, "that plants feed on unvegetised water, and that the carbon and nitrogen found in their system is derived from the atmosphere," is favoured by the researches of eminent chemists, but we know, from experience, that these "eminent chemists" sometimes play curious pranks "before high Heaven," which should make us cautious in relying on their testimony, especially when opposed to experience. We heard a great stir some time ago about the necessity of fixing ammonia, and the worse than useless practice of allowing manure to lie on the surface of the ground. This theory took its origin from Liebig, the father of "eminent chemists;" and, in a subsequent publication, he is of opinion that plants derive their nitrogen and carbon from the atmosphere. "Who shall decide when doctors disagree?" is an old adage, and I should be very loth to give an opinion at all on the subject, but that it is one which is capable of being proved by direct experiments. That Liebig is in error in the latter opinion must appear very evident to any person taking up the *Agricultural Gazette* of July 26th, and at p. 517, perusing a very able article by Mr. Bree, of Stowmarket, where that gentleman shows, in a very clear and convincing manner, that the question does not rest upon the testimony of chemists; and he further shows, by a series of experiments instituted by Mr. Lawes, and published in the Number for June 14, that plants take up nitrogen and carbon by their roots.

Mr. G. says, "I do not deny that the roots of plants may take up vegetable principles in a state of solution in water which may be incidentally offered to them, because they have no power of refusal, but I believe they are rarely offered to them and that they are not essential." Let me observe that there is a slight error here. That plants do not possess any power of selection seems extremely probable, judging from the facility with which they may be poisoned; yet it has been clearly shown by Daubeny that plants have, to a certain extent, the power of selecting their food by the roots. He found that when Barley was watered with distilled water, containing in every two gallons 2 oz. of nitrate of strontian, not a trace of that earth could be found in the ashes of the plants; and the same result was obtained with other plants treated in the same manner. "Hence it appears that plants do possess, to a certain extent at least, the power of selection by their roots, and that the earthy constituents which form the basis of their solid parts are determined as to quality by some primary law of nature, although their amount may depend more or less on the abundant supply of the principles presented to them from without." (Linn. Trans., vol. 17, p. 266.)

Mr. G. says that vegetable principles are not essential, and that the more we dig and manure the more the roots descend into the crude subsoil; but I consider they descend because they have deprived the soil of the matter necessary for their development, as in the case of corn, which requires a certain proportion of alkaline matter in the earth to render the silex necessary for their development quite soluble; and, of course, the roots having exhausted the soil around them, are continually going deeper in search of a further supply. It is certain that plants will not thrive where plants of the same species had previously grown; as for example, a young Apple orchard cannot be made to succeed where an old one previously existed; and why? because their roots have robbed the earth of certain principles which are necessary for the health of the young plants. No gardener thinks of planting Strawberries where a plantation had previously existed; but if their roots derived no nourishment from the soil, then, if Mr. G.'s theory be correct, he would only have to lay some manure on the surface, and a stream of gases arising from thence would be all-sufficient to give vigour and health to his plants. Why do we practise a rotation of cropping? Because when the wide-spreading roots have exhausted the soil in their vicinity, we then crop with tap-rooted plants, which penetrate where the wide-spreading roots could not, or did not; but when they, in their turn, have robbed the soil of its nutritive properties, we add manure, the component parts of which being soluble in water, are taken up into the system of vegetables to increase and perfect their organisation. This is surely a more rational theory than Mr. G.'s top-dressing, and however he may have "astonished the natives," by his crops of Celery and Cabbages, I am pretty certain that their astonishment would be much increased if they saw the Celery produced around Manchester by the application of plenty of good rotten muck to their roots; and I fancy it would not be easy to persuade a market gardener of Fulham or Battersea that to ensure success it was not at all necessary to manure the soil, manuring the plant being a much better method.

If plants derive their nourishment exclusively from the atmosphere, then it is quite foolish for gardeners to manure their Vine-borders, as in this case the leaves being under glass, cannot receive the influence of those gases of which Mr. G. speaks; yet we know that a judicious application of manure to a Vine-border is attended with the most beneficial results. Mr. G. fancies that he can perceive a beautiful example of the economy of nature in the manner in which the gases are caught by the stomata, and he exclaims with admiration, "How constant, how regular the supply!" But I view the subject in a very different light from him, and I, too, can perceive the beautiful manner in which Nature has disposed these pores, in enabling the plant to part with superfluous moisture, in allowing the entrance of atmospheric moisture when the tissue of the leaf is dried up: by their position on the under side in greater numbers, to prevent the too rapid evaporation which would infallibly take place if exposed directly to the sun's rays; and finally ceasing to exist in submersed leaves, where no variation can take place in the medium in which they are placed. Filled with admiration at this beautiful adaptation of means to the end, may I not exclaim

"These are thy glorious works,
Parent of good."

I have thus far, in a fair and candid spirit, stated my reasons for rejecting Mr. Goodiffe's theory; I may not have answered all his positions, but I have endeavoured to answer the principal ones, and any one may understand that an objection which takes up but a line, may take a page to answer it.

In conclusion, the principles deducible from what I have stated may be thus set down: That nitrogen and carbonic acid gases are taken up into the vegetable structure in a state of solution in water; that this fluid is absorbed by the roots, and ascends principally through the wood of the tree; that it is conveyed upwards by the cells and intercellular passages in part, but principally by vessels or tubes, provided for that purpose; that having reached the leaf in its crude and undigested state, it is there exposed to the influence of atmospheric action; that having parted with its superfluous water by evaporation, and decomposed carbonic acid, it is then sent downwards by the bark, and from thence distributed by means of the medullary rays, to every portion of the plant where its presence is necessary.—*James Whitaker, Lake House, Cheltenham.*

Home Correspondence.

Frosting of Asparagus—The best treatment, in my opinion, is to cut down the tops to 9 or 12 inches above the ground, and to fork over the beds in November, or now, between the rows, and to lay the crowns bare for the frost to act upon by turning the soil into the walks, there to remain during winter. As soon as the frost breaks up return the soil out of the walks to the beds, which will be good and rich, then fill up the walks only with good manure and dig it into them to be in readiness for another year, and it will cause the outside rows to push the shoots a week or two before the centre of the bed, and it makes a succession. The frost will not injure the roots of either Asparagus or Rhubarb, it invigorates and makes them grow stronger; my stalks are from seven to nine feet in height, more like young Larch firs than Asparagus. In returning my soil from the walks this spring I added salt sand from the beach and mixed it up with the fine pulverised soil before returning it to the beds, this next spring I intend only to return the soil and manure to the beds, and when I have done cutting, I shall apply next summer 1 cwt. of salt to each bed, and then fork it over between the rows; my beds are 12 yards long and 1½ wide.—*Wm. Coulam, Louth, Lincolnshire.*

How to preserve Rhubarb.—My method is to take a quart bottle with a wide neck, and to cut the stalks small enough to go into the bottle; I add brayed loaf sugar and tie a piece of bladder tight round the neck, I put as much water into the copper as will immerse the bottles, get the copper to boil just over the bladder, then rake out the fire, and let the bottles remain in till cooled, I then take them out, place them on a dry shelf, and use the bottle at once.—*W. C.*

Landscape Gardening.—Your remarks in regard to the planting &c. of parks, are quite true. But who are landscape gardeners; we hear a great deal about young gardeners learning the use of the rule and compass, and so far so good. But nature is not guided by either, let the young gardener lay aside these, for they are useless in imitating Nature, and taking his paper or canvas, with colours, and pencils, &c., let him try to imitate Nature with these. But it may be said those belong to the fine arts; and so does landscape gardening. Every gardener, and landscape gardener in particular, ought to cultivate the fine arts. It will be both a pleasure and a profit to them, and an improvement in landscape gardening will follow.—*J. W.*

Benthamia fragifera.—It is stated, in the last report of the meeting of the Horticultural Society, respecting this shrub, "that though it will grow out of doors, yet that it required the aid of a greenhouse to grow it to anything like perfection." As I was the first who grew it in this country, I feel anxious that this should not be stated without qualification. It grows and flowers and fruits abundantly at many places in this county; and this year does not seem to have been affected by the severe weather of last March, when, on one or two nights, the thermometer stood at 15° at this place, and at 16° at Sir Charles Lemon's. It is true that we escaped the severe trial of February, when the thermometer stood below zero at Chiswick; for, on the severest of those nights, it did not fall here below 29°. I think I have heard that the Benthamia grows in the open air, at Belsay Castle, in Northumberland. My impression is, that, if it has shelter from wind and has a favourable situation, it will flourish in many counties of England; on the contrary, in the draught of a cold valley, I know, by experience, it will not flourish in the western part of Devonshire. The parent plant here, which has grown from seed sent from Nepaul, is now 21 or 22 feet in height, and 20 inches in circumference at 3 feet from the ground, and 18 ins. at 6 feet.—*H. Trewayne, Heligan.*

Mr. Fleming's System of Vine-pruning.—My practice has hitherto been to pinch out all the eyes, except two at the base of each summer's shoot, as soon as they appear, and to cut off the shoot close to the first eye. But having been induced to try Mr. Fleming's plan of pruning (described at p. 115), I have found the result all I could desire, and more than I could expect; so much so that I intend practising his system upon all my Vines, as well as upon weak and newly planted trees. I find by correct measurement that the disbudded shoots decrease in circumference ¾ of an inch at least. It was when the Grapes began to colour that I first observed that the shoots grew smaller, and they continued to decrease till the fruit was ripe, which was in June. This being the case, allow me to inquire how the shoots did become smaller, unless by a return of the sap.—*John Tay, Portnall Park, Virginia Water.*

Glass.—An article in your Paper of Nov. 27, (page 802,) signed A., Walton, is a misstatement I feel it necessary to contradict. S. I. Arnold, Esq., of Walton-upon-Thames, says, that in consequence of a *great* smash, he obtained a sample of glass from me, which he found equal in all respects to foreign except in colour: he then makes a flourish about his national feeling, inducing him to give the order (it amounted to 16*s.*) to a native, and regrets his folly for trusting to me. My reply is this, I issue samples of all sorts daily, in some cases not knowing to whom; and when this order came (without a sample enclosed), I concluded from the smallness of the size that crown was required, and I

sent it. I shortly afterwards received a most uncivil letter, and judging I had to do with some ill-tempered or litigious person, I wrote to say if he was not pleased I would take the glass back,—what fairer proposal could a tradesman make?—*Robt. Cogan*, 48, *Leicester-square*. [We have inserted this letter in justice to Mr. Cogan, but with some curtailment.]

Ornithology (see p. 785).—I met lately a person who was obliged to destroy a magpie which incessantly annoyed people in the drawing-room by pecking and throwing itself against a window in a small ante-room, of which, being rather dark, the panes on the outside resembled a looking-glass. It being the breeding season this bird was supposed to have lost its mate; on recollection I think it generally came early in the morning, and not while people were about.—*M. R.*

Quercus sessiliflora.—I was not conscious before I read the communication of Mr. T. H. Cooper, in your last Number, that a continuation of the discussion in the shape of a reply to "An Old Forester," would have been acceptable to any party. I now resume, however, in warm hopes that Mr. Cooper's good example may make the conversation become more general. It is surprising how little this subject seems attended to. After the general invitation issued four months since, three individuals alone have offered their opinions, one of whom has, it would appear, no personal acquaintance with the tree in question. Is this owing to the rarity of the tree—to the silence of bashful scepticism—or to a general ignorance of the existence of such a tree as the sessile-fruited Oak? Whatever be the truth of the two former conjectures, I do not believe that observers of a common degree of penetration can pass the tree without notice. I was induced in October to take a walk to Steepwood, in consequence of my friend, Mr. Hugh Clement, having told me there was an Oak unlike any other Oak he had ever seen. I found it was Quercus sessiliflora that had attracted his attention, which proves that in this case we do not find the unscientific observer misled by believing "*Omne simile ut idem.*" There are great numbers of these Oaks in that wood, many of them very fine indeed, and all of a more elevated structure than the common Oak. I am informed by C. Serace Dickins, Esq., that he has the tree at Coolhurst, his seat, Though apparently to the weakening of the cause I am advocating, I will venture to quote here a portion of a letter I have received on the subject from W. Stent, Esq., the owner of the wood on Lisgate Common, where the tree is so abundant. "I was aware a variety (species) of the Oak grew there, and that it was of more rapid growth than the common; but whether more durable for ship-building I believe is questionable. We have been accustomed to call it the Fir-oak, I believe, from its growing with a spiral leader like a Fir-tree." Possibly many of your readers know the tree by that name, though I confess I see no good reason for distinguishing it by such a name. I will leave inferences from so opposite an account to be drawn by those who possess greater practical knowledge of the subject than I possess. It is for them to settle this momentous question, and not for such as I who have not a timber-tree in the world to cut down, whether for experiment or for profit. Experiments should be instituted to ascertain with exactitude the specific gravity, tenacity, and durability of the wood, and then no doubt this ill-understood, and little known tree will stand in much higher estimation than at present. This discussion should be carried on further by more competent authorities than myself. We all know the propagative tendencies of error, and that one generation is misled by its forerunner, through an indolent propensity to honour with unquestioning faith those traditions which the test of experiment would certainly have exploded—erroneous traditions of which every writer is more or less guilty in proportion as he examines truth for himself. Without meaning to wound the feelings of our sylvan friend, I cannot refrain from telling him that I think him at least one propagator, whether of truth or of error, upon this faulty principle; otherwise, why should he attempt to overwhelm me with a heap of quotations, and not one fact attested by his own experience. "Omnia explorate, meliora retinete" ought to be a chief maxim with every real naturalist.—*F. A. Malleson, Pulborough, Petworth.*

Chapman's Prince of Wales' Plum.—This Plum was raised at Brentford End in 1830, and is a seedling from the Orleans, but is quite distinct from that variety. It is larger, of a different shape, being inclined to be oval, different in colour, which is a bright purplish pink, with much more bloom, and the flavour is much superior. The flesh is yellowish or pale amber, and parts from the stone. Unlike the Orleans it never cracks, and the shoots differ from those of that variety in being smooth, whereas in the Orleans they are downy. The leaves are broad, roundish, and easily distinguishable from those of any other Plum. The trees are of vigorous growth. Upon stocks planted in the spring of 1844, and budded in August following, are this year shoots upwards of 8 feet in height. The bloom is protected by the foliage in a most remarkable manner, and it has a peculiar habit of spurring all up the branches. We have had trees, three years old, covered with Plums as thickly as they could be placed, at 3 feet up the stem, and we have been obliged to fasten the branches up with stakes to prevent them breaking down. We find them to bear well on suckers from the mother plant.—*Chas. Chapman, for C. and T. Chapman, Brentford End.*

Cereus grandiflorus.—I have a plant of this which produced 22 flowers last summer, but never more than eight were expanded at one time. It is trained on the back of a succession Pine-stove, at the hottest end, and made shoots last summer 3 feet in length, which I expect will produce abundance of bloom. With regard to the preservation of the flowers, I can assure "Bluebell" (p. 785) that I have not only preserved them, but have taken them to exhibitions, and have been awarded prizes for them four days after they had been taken off the plant. My plan is as follows:—As soon as they are fully expanded I cut them off, and then with sealing wax seal up the wound at the bottom of the flower; I then procure as many jars as I have flowers, and sufficiently large to contain one without touching the petals; I take a piece of string and tie it round the end of the flower, and attach it to the knob on the top of the lid, turning the latter upside down, and suspending the flower within the jar, which I then remove to a cool place and fill with water to the brim. I cannot say how long the blooms would keep in this way, but I have taken them carefully out four days after they had been enclosed, and upon giving them a gentle shake or two they have appeared as fresh as when they were removed from the plant.—*J. Marshall, gr., Grove House, Shelton, Staffordshire Potteries.*

The Potato Disease.—In this period of doubt and uncertainty with regard to the origin and extent of the disease which has so extensively attacked the Potato plant, will you allow me to inquire if the growers of seedling Potatoes—that is, of new varieties raised from the seed—have had their crops attacked? If it shall appear that such young varieties have escaped, this fact will lend some countenance to the conclusion that it is owing to the exhaustion of the powers of the old and common kinds of Potato that the origin of the malady may be traced. It is certain, however, that in some portions of our island and on the Continent, the Potato has entirely escaped the visitation; and I have also received some curious and valuable reports of the preservation of extensive crops when dressed with particular manures, which, when confirmed by more careful examinations, shall form the subject of a future communication.—*Cuthbert W. Johnson*, 14, *Gray's Inn-square.* [A conclusive answer to this inquiry has already been given by ourselves at p. 768.]

Potato Sets.—Your suggestions in last week's Number respecting keeping the eyes of Potatoes in wood ashes, has been previously tried, and we have a considerable quantity stored in that manner, which, so far, is satisfactory. In some parts of North America a practice has been resorted to which might possibly be useful here. The eyes are cut off daily from the Potatoes as they are consumed by the family, and placed in dry wood ashes which have never been wet; and when a sufficient quantity have been collected, they are packed with dry wood ashes in a barrel, or other vessel, so that they should not press against each other. In this manner the eyes may be kept till the spring, and then planted.—*Thos. Davidson, Stockpole Court, Nov.* 8

Potato Disease not Caused by Moisture.—Dr. Bell Salter has stated, in a late Number, that he does not believe the past summer to have been so wet as has generally been supposed, and that the Potato disease can, therefore, scarcely be attributable to excess of moisture. An examination of the quantity of rain at Chiswick, during the summer of 1845, as recorded in the "Annals of Natural History," compared with the series of years from 1838, fully bear him out in this assertion; the quantity from May to September inclusive having really been below the average, and no one month having greatly exceeded it. The quantity of rain at Chiswick from May to September, 1845, inclusive, has been 11·12, the average of the last eight years being 11·20. The monthly accounts stand as follows:

Average of last 8 years.		1845.
May	2·02	2·89
June	2·26	1·96
July	2·10	2·81
August	2·26	2·79
Sept.	2·52	1·77
	11·16	11·12

It will be observed that the average of the five months is slightly lower than 11·20, as stated before, in consequence of a little loss in taking the mean of each month. I have taken these five months as the only ones which can greatly affect the question.—*M. J. B., King's Cliffe.*

Autumn Planting Potatoes.—I promised to send you the result of Dr. Charles Trotter's experience with autumn planted Potatoes; last year he had the sixth of an acre planted in autumn, and had from it 60 bushels of large Potatoes, I say large, for they were all of a fine average size, with no small among them; while those planted in spring were very inferior samples, not half the quantity, and principally small. This is the third season that Mr. Trotter has planted in autumn and always with great success. The idea that first led Mr. T. to try the experiment was this, he found that strong soils in general could not be worked until very late in spring, in consequence of their retentiveness; whereas in autumn they could be got ready before they became wet, and then, also, the ground gets thoroughly pulverized by the winter frosts. All the farmers with whom I have had any talk on the subject, that is those that will only follow the old way that their grandfathers did, say, stop until a severe winter comes and the effects of autumn planting will be seen. Now I went over the field with Mr. Trotter in the end of February last, and many of the Potatoes had not more than 5 inches of soil as a covering, the manure being placed underneath them, and notwithstanding this the sets were found to be firm, sound, and good; they came up with great vigour, few only were diseased. I should say 10 per cent, although on a strong retentive soil. This is surely enough to convince those who follow the old system, that planting Potatoes in autumn is improving their practice. The greatest amount of frost last winter was 23°.—*G. Grey Watson.* [We presume the writer to mean 9° Fahr.]

Planting Potatoes.—I would be obliged by your opinion on the method I am now adopting in planting Potatoes. I am causing the "blind end" of the Potato to be cut off, keeping the end with the eyes for sets, which are carefully dusted with quick-lime, and then put on a loft for a week to dry. The sets when so prepared are planted 3 inches under long dung, and the dung is covered with about 8 inches of earth; the beds are two sods narrower than usual, and only three sets are put across the bed. Is there any fear of frost destroying the sets so treated? Is it safer to treat the Potatoes in this manner than to plant them whole? The sets were taken from the largest and best shaped Potatoes I could get. I cut off a portion of each Potato for two reasons; first, because I considered all the tubers this season surcharged with moisture; and, secondly, because the quicklime coming in contact with the cut part may possibly check any after tendency to disease.—*J. R. W., Cork.*

Greening Potatoes.—I wish I could confirm a correspondent's experience relative to the beneficial effects of greening Potatoes, but here the green ones have not kept so well as those not exposed. With me it has been a practice for some years past to lay such Potatoes as were not fit for table out to green daily as they are dug, and this year, at the time the disease made its appearance, I had several bushels so exposed, and perfectly green. Some of these Potatoes had been exposed two months, being the refuse of the frame forced ones, and had been severed from their parent stem long before the disease was heard of, so that those who assert that it commenced in the stem or haulm will see that it seized those which were stemless at the same time. The malady first made its appearance here on some Ash-leaved Kidneys, planted upon the "lazybed" fashion, the beds, however, being filled with the refuse of the garden and pleasure ground, with sufficient hot dung to excite fermentation; this rubbish was put in sufficient quantity to raise the beds considerably above the level of the surrounding soil, so that it was perfectly porous and dry, and the Potatoes were of the finest quality imaginable. Shortly afterwards it manifested itself on two other pieces of the same kind, one a piece well drained and trenched the autumn before planting, and the other a piece of ground newly taken in, well drained and deeply dug, but not trenched. On the latter piece of ground every Potato was rotten, and the other about one-half was lost, so that although they suffered the most in untrenched ground, where the water could not pass rapidly away, perfect drainage did not stop the disease. All these Potatoes were dug on the same day and laid out to dry and green, and though they were exposed for two months, and perfectly greened, the disease is still spreading in them. At the time these were dug, the end of July, a peck or so was found among them that had made young shoots and were perfectly sound; these Immediately planted with some of Chapman's Kidney for winter use, and though the latter produced a tolerable crop of sound tubers, very few of the Ash-leaved made their appearance above ground. I examined the sets to-day, and find most of them sound, and intend as an experiment to take them up, and replant them deeper to see if they will produce a crop in the spring. Now, although I cannot say anything in favour of greening, as to its effect in stopping the disease, I may state that the process, in my opinion, renders the Potato set much more capable of enduring frost and cold. It may seem strange what I am about to state, but nevertheless it is a positive fact. After the severity of the last winter was over, indeed after the thermometer had been as low as zero, a friend brought me several Potatoes from a market garden on the Maize Hill, Greenwich, which were a part of a quantity that had lain fully exposed to the severity of the weather without being in any way injured, and placed them in the plant stove in some sand, and they grew vigorously, and I had intended to have preserved the stock, but unfortunately the garden woman, when she cleaned the house, considering them intruders, threw them out, and I lost my stock. This fact, will, I hope, give a little confidence to those who may be afraid of autumn planting, as I am quite sure there is nothing to be feared, more especially if the ground is well trenched, so as to allow the latent heat of the earth to rise to its surface. It would also be well, after the frost has mellowed the surface of the soil, to take a rake on a dry day and rake the ground perfectly smooth and fine. This will prevent the heated air from escaping, and we all know that confined air is an excellent non-conductor, and therefore, when properly managed, is a good protecting medium. It may be as well to remark, in connection with the frost-resisting powers of the greened Potatoes, that of a quantity of them placed in a basket and exposed to the weather, those on the top of the basket were sound, while most of the under ones (not greened) were much injured. So much for greened Potatoes. In addition to the preceding Potatoes, I had a quantity planted in a field on old pasture ground in a dry situation, and from which the turf or sward had been taken for repairing the lawns, &c. This ground being shallow and sandy, was repeatedly ploughed and harrowed until I got it into fine tilth, and upon it I planted the Ash-leaved Kidney,

Shaws, and Bratten's Kidney—an excellent late Potato. In this patch of about 1½ acre, the disease first made its appearance, in the driest and warmest corner of the Ash-leaved Kidney, and in a week the tops were lifeless. It then spread to the Shaws, and finally to the Brattens. On digging the Ash-leaved several weeks after the tops were dead, I found them diseased, but not so extensively as I expected. I had them collected without sorting, and laid in an outhouse in a layer about 18 inches or 2 feet thick. Here they remained and sweated for a month or more, my opinion being that if I allowed them to sweat, all that were infected would rot at once, and in this I was quite right, as on sorting them carefully not more than one sack in ten was found to be diseased, while the remainder were, and are as sound as could be desired. The Shaws were dug, sorted, and the best of them pitted, and nearly half of them rotted, while of the small ones sweated in a shed very few were lost, and the same may be said of the Brattens; so that so far as my experience extends, careful sweating and selecting afterwards is the best preventive for the spread of the disease. I have as fine a lot of seed of the preceding kinds as could be desired. All kinds of roots here are more or less affected; Onions, Turnips, Carrots, Parsnips, Beet, and Mangold Wurzel. Indeed, I have no doubt that the excessive cold which seized, as by paralysis, the Potato crop, also did considerable injury to all tender vegetation. It will be well if the injury should be confined to the present crop, but I am afraid the Irish Commissioners' suspicion that injury may be done to a succeeding crop if the ground is not limed and well prepared, is too well founded. Mr. Pawley, of the White Hart Hotel, Bromley, informs me that in a field of his, one-half of which was sown with Tares, and the other planted with Potatoes, and which were very much diseased, he finds, now that it has been sown with Rye, the plants on the Potato part very thin, weak, and sickly, while on the Tare part of the field the crop is as good as could be wished. This looks unpromising, and it would not only be interesting but useful to know how others who have sown it and the Potato ground where the disease was bad, likely to produce another crop. My ground sown with Turnips, to plough in or be folded off with sheep, is promising.—*W. P. Ayres, Brooklands Park, Blackheath.* [Experiments instituted for the express purpose of determining whether crops are injured by immediately following tainted Potatoes seem at present to prove that no danger is to be apprehended.]

Storing Potatoes.—In reply to Mr. Curr's inquiries (p. 808), as to the efficiency of turf or peat in preserving Potatoes, I imagine that that material is more to be depended upon than any of those chemical appliances about which so much has been written and so little known. The readers of the *Liverpool Mercury* may recollect a short article, inserted about a month since, on this subject. The statement is substantially correct, and I am convinced from experiment that the softer kind of turf, broken into pieces about the size of the Potatoes, and mixed with the same, bulk for bulk, will preserve them dry and sound during the severest frosts and rains; and this, with a very slight covering. I offer the following facts in proof:—The writer pitted a quantity of different kinds of Potatoes, obtained from seed, in October, 1844. These were put into large flower-pots, to keep them separate, intermixed with turf broken into small pieces: placed in a trench side by side, and covered over with two or three inches of soil. This covering, in the course of the winter, being partly washed off by the rains, or having crumbled down so as to expose the rims of the flower-pots, I had not the least idea of finding my seedlings uninjured, my object in using the turf being, as a non-conductor to keep them cool, at the same time reckoning upon its absorbing any superfluous moisture that might arise in what is called the sweating. On removing the soil in February, in order to plant some bulbs, my surprise was great indeed to find: 1st, my pots not only safe and sound, but what may appear rather marvellous, considering the extreme severity of the season, although the Potatoes were perfectly dry, the peat was covered with hoar-frost, and numbers of centipedes, woodlice, and small slugs had found a safe shelter at the bottom of the pots. The sound and dry state of my seedlings, of which many persons were eye-witnesses, led me to adopt a kind of roofing with the same material, as a protection to their progeny, now increased to several bushels. About two months since these were placed in narrow rows and covered over. They were inspected this morning, and with the exception of two of the tubers that happened to lie above the apex of the roofing, all were sound. The antiseptic qualities of bog-water is generally admitted; and should Mr. C. have any doubts on this head, I could furnish him with a particular instance of its efficiency that might appear too improbable for public insertion, but which is equally well attested as the above. In conclusion I may mention that Mr. Fincham, the manager of the Ravenhead Plate-Glass Works, near St. Helen's, informs me that he has managed to stop the progress of disease among his Potatoes, by leaving an opening at the bottom of the heaps, so as to cause an upward current of air. I suppose the channel must have been covered with hurdles or brushwood.—*A Correspondent.*

Storing Potatoes in Bean-dust.—As you are collecting facts which may bear upon the several questions connected with the failure of the Potato crop, I send you one. A labourer of this parish, observing that several of his Potatoes had sprouted, thought he would try to preserve them for seed; he carefully stored up 2 bushels in perfectly dry Bean-dust—the refuse that is left after threshing and removing the Bean-stalks. The moisture exhaled from the Potatoes so completely saturated the Bean-dust, that it heated and became charred! Some of the Potatoes were half roasted; and if the circumstance had remained unnoticed for a day or two longer, it is not impossible that his cottage might have been burnt down by the spontaneous ignition of the heating mass.—*J. S. Henslow, Hitcham.*

Potatoes from Seed.—(From the *Preussische Zeitung* of Oct. 19th, 1845). Made public by order of the Minister of the Interior.—The disease in Potatoes, which has this year appeared in many parts, has rendered it necessary to raise them from seed, but as the old method required several years to produce tubers of a sufficient size, it is little practised. Zander, Count Arnim's gardener, at Boitzenburg (in Mecklenburg), has succeeded in producing a good crop of Potatoes from seed the same year it was sown, and as large as those from sets, and those seedling Potatoes are entirely free from disease. His plan is as follows:—He gathers the Apples before the frost sets in (according to others a slight frost does not injure them), and keeps them in a dry place till the end of January. The Apples are then crushed with the hand into a vessel, where they lie from six to eight days to rot, that the seeds may be easily separated from the pulp. Water is then poured on, and the seed is washed and dried like Cucumber seed, and put away in a dry place. At the end of March, or beginning of April, the seed is sown in a hot-bed, and treated much the same as other culinary plants. If there is a convenient place for a hot-bed near a wall or house, exposed to the sun, glass is not necessary; the plants may be treated like tuberous plants, but as they are very susceptible of frost at night, they should be covered with straw or boards, which can easily be done, as the bed is surrounded with boards set in the ground, upon which the covering can be laid without injuring the plants. In May, if the plants are well grown, they can be planted out in a light soil about the usual distance that sets are planted. Zander this year sowed early Potato seed on the 11th of April, and planted them out on the 26th May; and here we may remark, that vegetation is 14 days later in Boitzenburg than in Berlin. The plants produced from 1 to 1½ gallons (Metze) of tubers. One plant even produced 289 tubers. There were of course a great many small tubers among them, yet the produce of large ones was on the whole equal to the produce from sets. As Zander has followed this plan for five years, he was able this year to give seed to several gentlemen's gardeners and labourers. The Potatoes raised by them have all been healthy, while the disease was everywhere, and even in the neighbourhood. The result of this experiment deserves to be widely spread, that people may still preserve the Apples for next year. The space of half a square rood of land (7 ft.) is sufficient to raise enough to plant 1 acre,* so that it will be useful for small farmers who plant just enough for themselves.

Societies.

MICROSCOPICAL SOCIETY.

Dec. 9th.—Dr. Lankester in the chair. J. Handford, Esq., and W. Theobald, Esq., were elected members. Professor Edward Forbes read a paper on the organs of sense in Thaumantias, a genus of Meduste. The bodies of these animals are exceedingly small, of the form of a watch-glass, and having from eight to sixteen tentacula. He had taken these animals in great abundance off the Shetland islands during the month of August last. After describing the structure of the whole animal, he drew attention to the development of its tentacula. These first commence with a cell, which, by dividing itself into two parts, lengthens out and forms the tentacula. The first cell does not go on increasing above, but remains at the edge of the body of the animal, and grows larger, at last exhibiting in its interior crystals of carbonate of lime. These were regarded by Keliger, Will, and others, as otolites, and to this opinion the author was inclined to subscribe. No nervous system had yet been demonstrated in these animals. Mr. Varley made a second communication on the subject of the Characeæ, and exhibited preparations illustrative of the remarks made at the last meeting. He exhibited and described diagrams of the species of Nitella, in which he had discovered a structure consisting of cells containing green matter, and which was found both in the inside and on the outside of the tubes in which the circulation was observed. The Chairman pointed out the fact that the nucules containing the reproductive matter of the Chara vulgaris were surrounded by five tubes which corresponded with the number of branches developed from each bud, and thus indicating the morphological relation of these parts.

Reviews.

Drummond's First Steps to Anatomy (12mo. Van Voorst) claims our attention in consequence of the comparison which the author draws between animal and vegetable vitality. In the conclusion at which he arrives with regard to the nature of life we entirely concur. "From all that has now been said," he remarks, "it must be obvious that our knowledge of the immediate cause of life only becomes more obscure the more we attempt to penetrate the mystery; we find it in a thousand forms; we trace it in various states in animals and their germs, and in plants and their seeds; but in what its original essence consists we cannot understand." As a useful and agreeable introduction to a most important branch of study, the book may be confidently recommended. The following anecdote, illustrating irritability, as distinguished from vitality, is, probably, new to some of our readers—"I had, on one occasion, a rather novel illustration of muscular action in an organ dismembered from the body it belonged to. Being on the sea-shore, at Porto Bay, in Sardinia, and searching for specimens of natural history, I observed a large lizard running for shelter under a heap of stones. I was just in time to seize it by the end of the tail, but suddenly the resistance made by the animal to my attempt to drag it from its hiding-place ceased, and I gave it up for lost; but as suddenly had cause for alarm myself, on seeing what appeared to be a small snake, leaping with great agility about my feet, and springing as high as my knee. I instantly started out of its way, and watched it at a respectful distance, when I found that it was the tail of the animal, which I was not before aware could so easily separate; it kept leaping about for a few minutes, but long after it had become spontaneously quiescent, it exhibited lesser degrees of muscular contraction when disturbed."

De Prati on Chronic Diseases of the Skin (12mo. Baillière) demands a place here for the same reason as the last book. Although principally occupied with skin diseases and their cure, it admits some account of the medicinal virtues of plants. Dr. de Prati is a great advocate for vegetable remedies, and evidently belongs to that class of practitioners who lament the neglect into which the uses of herbs have, as we too think, undeservedly fallen. He points out the efficacy of Leopard's-bane, or Arnica montana, in ulcers and diseases of the skin; of the Lady Thistle, Carduus marianus, in derangements of the liver, &c.; of Herb Bennett, or Geum urbanum, as a tonic when bark and cascarilla fail; and of Pot Marigold, Masterwort, Soapwort, and others which have all fallen into unmerited oblivion. Herbalists, and all who have faith in vegetable remedies, should read this little book.

Hamilton on the Pine-apple (2d edition, 8vo. Masters), was alluded to by us last week in a Leading Article. It is a great improvement upon the 2d edition, and contains plans of a Pine-house. No Pine-grower can dispense with it.

Johnson's Gardeners' Almanack for 1846 is, as formerly, all that a gardener can desire in such a book. It is full of useful information, well arranged, and carefully indexed. We have frequently found it convenient to refer to the last edition, and we doubt not that this will be equally serviceable. We would suggest that in next year's edition a comparative scale of Fahrenheit and Reaumur's thermometers, and a reduction of common French weights and measures to their English value should be permanently introduced. They would make a good frontispiece.

Roe's Handbook of Fountains (12mo. Groombridge). The author, who is a well-known and ingenious hydraulic engineer, states that "the object of his work is to draw attention to the use of fountains as a valuable and desirable decoration to parks, gardens, &c.; to show what taste has done and may accomplish, point out the mechanical contrivances and appliances, and the resources necessary or which may be available, and give an indication for the direction of design. In following the latter purpose, and noticing the examples given in the celebrated fountains of Versailles, the observations are intended as a guide to the stranger in his visit to that far-famed spot." Some designs, neatly drawn, representing some of the celebrated Versailles fountains, accompany the pamphlet; and although their taste is open to criticism, yet they afford the untravelled reader an idea of what should be done with fountains; just as those of London show what they should *not* be. At the end is a repetition of the story of Du Barri's diamond necklace, the connection of which with fountains it passes our skill to explain.

Hassall's Fresh Water Algæ (2 vols. 8vo. Highley) is severely criticised in Taylor's "Annals of Natural History" by some one much more conversant with the subject than we are. The author of that notice says that many of the plates, professing to be original, are copies, made without acknowledgment; that the comparative characters by which one species is distinguished from another are absurd; and that the references to other writers are unpardonably incorrect. Nevertheless, as a whole, the work is regarded as a proof that "the author is possessed of very considerable ability, more especially of extensive powers of discrimination, though not of definition." We cannot attempt to soften this down; on the contrary, we must add that Mr. Hassall does not appear to possess that most important attribute of a naturalist, the power of arranging all things in due order. His introduction, for example, is a confusion of facts and opinions brought together with so little method that it is often difficult to perceive what relation they bear to the matter in hand. In the body of the work the author follows some plan of arrangement peculiar to himself; but for what that plan is we search in vain. To augment the confusion, some of the author's "families" have characters given them, as Siphoneæ and Characeæ; but others, such as Lemaneæ and Callithamneæ, have none! In short, a very difficult subject is rendered more perplexed than ever by the strange way in which it is treated. However, we must not let it be supposed that Mr. Hassall's book deserves no sort of commendation. On the contrary, it has some good observations, and the plates that accompany it, whether original or not, are extremely useful, and will

* The German acre is much the same as the English one.

prove of great assistance to the student of the obscure slime-plants and water-threads which it illustrates. They are neatly engraved, nicely printed in colours, and although not comparable to Kutzing's, form by far the best collection of such figures which we have in English botany. We also think that Mr. Hassall has acted judiciously in steering clear of the ocean of "new" species in which his original announcement led us to fear he would be engulfed.

The Supplement to Yarrell's British Birds (Van Voorst) contains figures and an account of several rare species lately added to the list of visitors to these islands. Need we say that the Supplement is in all respects worthy of the high reputation of Mr. Yarrell's original work?

New Plants.

—Lelia peduncularis. Long-stalked Lælia. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—When this plant was named, in the winter of 1841-2, upon the inspection of a specimen sent to London, from the collection of Mr. Barker, of Birmingham, a very imperfect idea was formed of its real beauty, for the specimen was withered, and injured in the transmission. In November, 1844, we, however, again received it from the same gentleman, and then found it to be what is here represented, one of the most ornamental, and perhaps the most graceful, of the genus. Its flowers are of one deep rose colour, a little heightened at the lower part of the lip, and they droop gracefully from the end of a slender elastic scape. The unusually long peduncles add to the elegant appearance of the species. It approaches most nearly to the Lælias rubescens and acuminata. From the former it differs in its lip: having none of the hairiness of that species, and its flowers being much more closely arranged; from the latter, in neither its petals nor lip being wavy and sharp pointed; and from both, in its very large whole-coloured flowers, flat jagged petals, short recurved lip-lobes, and very long flower-stalks. The species is one of Mr. Barker's valuable importations from Mexico. It may either be tied to a block of wood, with a little sphagnum to retain moisture, or it may be potted in turfy-heath-mould, in the usual way. During the growing season, an ample supply of water should be given, and the atmosphere kept as moist as possible, at a temperature of 80° by day. To accomplish this, it will be necessary to use a slight shading in bright weather, which will also prevent the leaves of the plant from being scorched by the mid-day sun. In winter, if the atmosphere can be kept moist, very little water will be required for a few weeks. The temperature should never be raised above 65° with fire heat.—*Botanical Register.*

Govenia fasciata. Linden's Govenia. (*Stove Perennial.*) Orchidaceæ. Gynandria Monandria.—This is one of the prettiest of the genus, having clear yellow flowers, whose sepals and petals are beautifully marked by fine broken bands of crimson. The long bracts, thin narrow spike of flowers, and oblong, not ovate, lip, are the marks by which it is best recognised. The leaves are about 1 foot long, and 3 inches wide. It flowered in the collection of Mr. Rucker in September, 1843. It requires to be potted in rough peat mixed with about one-third sandy loam. Being a terrestrial Orchid, it necessarily requires an ample supply of water during the growing season, and a slight shade in sunny weather. In autumn, when its leaves begin to die off, water should be gradually withheld, in order to give it its due season of rest; for if watered and excited to grow in winter, when there is not sufficient light to mature the tubers, they will be small and apt to damp off; nor will it succeed in summer if this is not properly attended to. In spring, when it begins to show symptoms of growth, it should be re-potted and placed in a humid atmosphere, where, for a few weeks, it may receive water every fine day.—*Botanical Register.*

Garden Memoranda.

The Conservatory at Chatsworth Park.—This magnificent structure may be regarded as one of the greatest of modern works in gardening. Whether viewed externally, in its extreme elevation, or internally, in its general adaptation to the mature growth of exotic plants, the eye is fully satisfied by the uniform and simple grandeur of its proportions; presenting a striking instance of the power of art over the adverse influence of climate and situation. The superstructure represents a curvilinear dome of progressive elevation—the lower side-wings rising 25 feet from the ground-level, from the angle of which the upper dome rises to a final elevation of 60 feet, the length being 270 feet, the width of the ground area is nearly 100 feet, and the upper dome is 70 feet in diameter. The principal side-fronts face the east and west. The general entrance is at the north end, forming a direct communication with the grand central carriage-road which passes through the conservatory to the south end in immediate connection with the pleasure-ground which surrounds it. The ground-level is formed into four pits or borders, two on each side of the central path; a pathway is also formed between the borders for convenience of access to the plants. A platform surrounds the entire area along the side-wings for the arrangement of plants in pots, the north-east end of which is occupied with a select collection of Ferns; amongst them were vigorous plants of Aspidium Serra, Polypodium spectabile, Gymnogramma ochracea, Woodwardia radicans, Asplenium Nidus, Lonchitis pubescens, a species of great delicacy and beauty; Cænopteris japonica, and Aspidium falcatum. On the right of the north-east front is an immense pile of rocks, from the recesses of which some of the larger growing Ferns are thriving luxuriantly. Amongst the most conspicuous, were—Cibotium Baromez, having noble fronds or leaves 9 feet in length; Asplenium præmorsum, Didymochlæna pulcherrima, and Dicksonia ferruginea. As a continuation of the east front, the artificial rock-work extends 54 feet at a lower elevation, and forms an aquarium (for water-plants), having a massy belt on the back-ground, formed of fossil-rock and tufa stone, amongst which were growing in ornamental masses luxuriant specimens of Caladium odoratum, C. esculentum, Arum venosum, the latter remarkable for its immense leaves. The elegant Papyrus antiquorum was displaying its graceful terminal clusters of rush-like stems, from 6 to 9 feet in length, near the margin of the water. Limnocharis Humboldtii was also unfolding its lovely lemon coloured blossoms, which reposing upon the dark green foliage had an admirable effect. Amongst the miscellaneous species upon the margin and inner verge, were extraordinary plants of Richardia æthiopica, forming a striking ornament throughout the winter. Nymphæa cærulea, with azure-blue flowers, and Sagittaria gigantea. On the more elevated parts of the rock, large masses of Hedychium coronarium, Alpinia nutans, and various species of Canna, together with the beautiful-habited Papyrus, formed a highly picturesque back-ground to the whole. Passing the aquarium, a noble group of the Musaceæ appears as a commencement of the east front ground-pit, in which all the plants now under notice are planted. The species of Musa comprise rosacea, coccinea, Cavendishii, and a new species with large irregular purple blotches upon the leaves. These noble specimens were from 18 to 20 feet in height, with leaves from 7 to 10 feet in length, and 2 to 3 feet in width, and presented a rich contrast to the differently-habited plants around them.

Amongst the finest plants, as they occurred in continuation, were Erythrina Crista-galli, 8 feet in height, and the same in diameter, producing a second crop of flowers, in spikes of from two to three feet in length. Salvia splendens, 8 feet in height, and 25 feet in circumference, with several hundred spikes of orange-scarlet flowers. An Aralia, a noble plant, 16 feet in height; Euphorbia jacquiniflora, 7 feet in height, and 12 feet in circumference, promising a rich harvest of bloom; Hibiscus Jerroldianus (same as speciosus) 10 feet in height; this is a fine herbaceous species, with rich crimson flowers, 6 and 8 inches in diameter. Michelia oblonga, a fine specimen, 16 feet in height, and 36 feet in circumference, producing thousands of fragrant blossoms, similar to those of a Magnolia. Lagerstræmia indica, 12 feet in height, and 22 feet in circumference, crowned with rose-coloured blossoms; and Carica Papaya, 12 feet in height. On the south end border were Lagerstræmia elegans, a magnificent shrub, 14 feet in height, and 44 feet in circumference (differing from L. indica in its more diffuse habit of growth) producing hundreds of rosy-pink blossoms. Hibiscus sinensis Parkeri, 13 feet in height, and 21 feet in circumference, one of the most beautiful shrubs for conservatory culture, and ornamented with crimson blossoms from four to six inches in diameter. Saccharum officinarum (the Sugar Cane) about 20 feet in height, Cookia punctata, a neat habited tree, with dark green winged leaves. Inga Harrisii, 13 feet in height, and 30 feet in circumference, producing thousands of delicately-shaded crimson, tassel-like flowers in spring. Amongst plants on the east front border, were amazingly fine specimens of the old stove shrub, Eranthemum pulchellum, from 2 to 3 feet in height and 12 feet in circumference: Justicia speciosa, equally neat in its habit of growth, producing numerous purple flowers in autumn; Gesnera oblongata, also one of the finest winter-flowering plants. On the south-west end border are beautiful specimens of Cycas revoluta, and C. glauca, extending their elegant feather-like fronds, or leaves, 24 feet in circumference. A large and noble group of Musa Cavendishii introduces the visitor to the west front, in the border of which was a matchless specimen of Poinsettia pulcherrima, 17 feet in height and 18 feet in circumference, displaying its gorgeous orange-scarlet bracts, from 12 to 18 inches in diameter: also, Hibiscus rosa sinensis, 10 feet in height, and 24 feet in circumference, forming a compact tree, richly ornamented with scarlet blossoms; Lantana mixta, 10 feet in height, and 33 feet in circumference, uniformly studded with orange blossoms; Duranta Plumieri, 11 feet in height and 15 feet in circumference.

A varied feature is assumed in the continuation of the west-front border, by a group of plants, representing the natural order of Cycads, in the genera of Zamia and Cycas, planted between the interstices and divisions of artificial rock-work, representing their native modes of growth; amongst these were Cycas revoluta, 21 feet in circumference, and C. circinalis (Sago Palm), 15 feet, the latter producing its elegant feather-like fronds (from a central column), 5 feet in length. Zamia pungens, 8 feet in height, and 26 feet in circumference. Z. Altensteinii, 10 feet in height, and 27 feet in circumference. Z. caffra, with column-like stems, 10 feet in height, each surmounted with a crown of winged leaves, 15 feet in circumference. Elate sylvestris, with a pillar-like trunk or stem, 10 feet in height. In the west-front border is a small but luxuriant grove of the Mandarin Orange (Citrus nobilis), many of the plants measuring 6 feet in height, and from 10 to 14 feet in circumference. On the north-west end, a plant of Abutilon striatum presents a fine appearance, being nearly 20 feet in height, and as much in circumference, gaily ornamented with hundreds of pendent bell-shaped orange blossoms. Near this were two magnificent specimens of Brugmansia suaveolens, nearly 15 feet in height, and 40 feet in circumference, on each of which were several hundred flowers, each measuring 12 inches in length. A portion of the west and the north-west borders is margined in front with a row of the Agave americana, relieved with occasional specimens of the variegated variety, and with good effect. Amongst the plants on the west border which appeared well adapted for under shrubs, or for marginal effect, were Justicia carnea superba, a beautiful shrub, with large terminal racemes of lively rose-coloured flowers; Stachytarpheta mutabilis, with long flower-spikes of light rose and pink; Melastoma Mexicanum, a neat habited species, with white blossoms: Goldfussia anisophylla, a compact and dwarf-growing shrub, producing purplish-lilac Gloxinia-like flowers in winter; Barleria purpurea; Ruellia formosa, a valuable but neglected plant, which produces numerous scarlet blossoms in spring and summer; and lastly, a plant which everybody ought to possess, viz., Franciscea Hopeana; this has a good habit, is easily managed, and a profuse bloomer; it is also admirably adapted for forcing. Amongst the principal plants occupying the inner borders right and left of the great central path, were two specimens of Dracæna fragrans, 16 feet in height; Charlwoodia stricta, 18 feet; and a noble specimen of Sabal Blackburniana, extending its elegant fan-shaped fronds nearly 60 feet in circumference; Bombax aculeata, 35 feet in height; Carolinea alba 22 feet in height; Hibiscus liliiflorus, a wonderful tree-like specimen, 18 feet in height, and 48 feet in circumference, expanding hundreds of bright rose-coloured flowers, 6 to 8 ins. in diameter; Cocos plumosa, 40 feet in height, with terminal feather-like fronds, each 18 to 20 feet in length; Cassia corymbosa, a very beautiful object, 14 feet in height, and 36 feet in circumference, having large terminal racemes of golden yellow blossoms, forming a fine contrast with its dark green Ash-like leaves; Dracæna draco (the Dragon tree), with a trunk or stem 18 feet in height; Crotalaria laburnifolia, 18 feet in height, with drooping panicles of flowers like the Laburnum, but of a larger size; Araucaria Braziliensis, 30 feet in height. Several fine specimens of Furcræa gigantea, extended their immense crowns of leaves upwards of 40 feet in circumference; Hibiscus splendens (producing large light rose-coloured flowers, from 6 to 9 ins. in diameter), 30 feet in height; Sterculia platanifolia, 40 feet in height; Acacia cornigera, 12 feet in height; Erythrina arborea, a robust branching species, 12 feet; Corypha umbraculifera (the Great Fan Palm), 20 feet; Corypha australis, 14 feet in height, and 45 feet in circumference; Cedrela serrata, a fine habited plant, with beautifully-winged leaves, from 4 to 5 feet in length. Amongst plants of medium sized growth, were Strelitzia reginæ, S. angustifolia, S. ovata, S. juncea—the last four species are extremely valuable for winter decoration; Solanum Quitense, an extremely large-leaved species with axillary blue flowers 2 ins. in diameter; Hedychium Gardnerianum, one of the most ornamental of the genus; Hibiscus mutabilis, a neat herbaceous species, 8 ft. in height; the buff-flowered H. Cameronii; H. palustris, a robust herbaceous species, with large pink blossoms, 5 ins. in diameter; H. hirta, a fine herbaceous species, 5 feet in height; the well-known Manihot, a very ornamental half-shrubby species, with red and yellow blossoms, measuring from 6 to 8 inches across. A central cross-path, passing at right angles from east to west, has parallel borders planted with Musa sapientum; the specimens being from 16 to 25 feet in height, have a very noble and imposing effect. From the south entrance the general view of the inner borders is partially intercepted by a lofty screen, formed of Bambusa arundinacea (the Himalayan Bamboo Cane), which is admirably adapted for the object in view, on account of its immensely long and elegant reed-like stems. Returning to the north entrance, attention is again arrested by the immense mound of rock and tufa-stone, which is rendered not less subservient to ornamental effect, than to its primary object—of access to the upper dome; on its summit were specimens of the Mandarin Orange, 25 feet in circumference, bearing a profusion of fruit; also luxuriant plants of Anona Cherimolia (Cherimoyer). Various species of Opuntia (Indian Fig), and Epiphyllum, also gave a diversified feature, whilst the numerous masses of Ferns and of the still more delicate Lycopodium (Club Moss), and the creeping stems of the Ficus repens (F. stipulacea?) adhering to the surface, softened down the rugged outline to the harmony of natural effect. In the centre of this artificial arrangement is the winding ascent to the gallery and the spacious dome, which is nearly 30 feet from the ground-level, and from whence a view may be obtained of the central area, where the rare and unique specimens which meet the eye impress the stranger with a belief that every climate under heaven has contributed its richest ornaments to adorn this magnificent fabric. —*W. W.*

Miscellaneous.

Challenge from the Derby Florists.—We learn from a country newspaper that a letter has been sent to Mr. J. F. Wood, of the Coppice, from Derby, throwing down the gauntlet to the florists of Nottingham for a friendly tilt in the floricultural arena.—Mr. Wood lost no time in convening (by public notice) some of the principal growers. Mr. Spencer, of Adbolton, was unanimously voted to the chair, when the subject underwent a full discussion, and certain resolutions were passed, which

are to be forwarded to Derby, for the approval of the florists there. The following is the challenge:—"We propose to show you—six growers within four miles of Derby, against six growers within four miles of Nottingham—five pans of Tulips and five pans of Carnations; and to have every flower a distinct variety, that is to say, thirty tulips, not two of a sort, and fifty-five Carnations, all distinct varieties. No shower to be allowed to crop from any garden unless he has had that garden in his possession twelve months prior to the exhibition."

Scenery of the Lower Region of the Rocky Mountains to the Eastward. 1st Sub-region.—Extensive depressed tracts of the great plains, on the sources of Platte River and the Colorado on the West, being subterraneous continuations of the southerly spurs of the Black-hills. They consist of great ranges and detached piles of horizontal new red sandstone based on deeply inclined masses of the coarsest conglomerate, rarely directly on bituminous shale, under the great detached piles, or near river-defiles. The depression is about 200 feet below the general level of the plains above. In traversing the great sandy deserts, the traveller's attention is excited by numbers of obtuse conical piles, towering above the level of the plains, and forming a sort of belt north and south in the south pass along the horizon. Northward, leaning on the pine and snow-clad central chain of the R. Mountains; southward, losing themselves in the endless plains of Upper California. Suddenly the traveller finds his course arrested by a precipice, he surveys it with wonder, and imagines the exhumed ruins of Herculaneum or Pompeii are before him. Spacious streets and avenues of level rock, formed by regular ranges of new red sandstones heaped into grotesque ruins, or high massive piles of conglomerate, containing globular, oblong, or columnar boulders imbedded in a grayish soft claystone cement. These boulders are of great size, smoothed by trituration, sometimes partially freed from cement, fronting the main pile and resembling columns, statues, or monuments of every shape. On the top rests the obtuse conical cupola remnant of sandstone, surrounded by a variety of small turrets, bearing likewise on their summits curiously shaped cupolas of greenish or brownish sandstone. In another direction a series of low, oblong, angular platforms of sandstone, resembling tombs, or extensive terraces of astonishing regularity, with basins full of brackish water; piles of globular boulders, or obelisks, balancing a curious block of sandstone, may be met with here and there in the spacious plains. The outlets are mostly narrow, dark defiles, and, on passing them, another such monumental city of Nature's own work is before the traveller; and not until he is so fortunate as to strike upon a river can he again resume his direct route. An almost total absence of animal and vegetable life, and a death-like stillness pervade these regions, which, together with the want of good water, of Grass for the horses, and the parching sun of August, rendered this the most intolerable place I ever visited in my botanical rambles. Yet I was not disappointed, for some of the rarest specimens of plants in my collection were gathered from one solitary cliff within this region, about the junction of Ham's and Black's rivers, of the uppermost waters of the Colorado on the west. A low crest-like ridge of sandstone rises on an isolated massive bed of bituminous shale, sloping towards the river from the adjacent desert; plains teeming with luxuriant plants of Stanleya viridiflora, Nuttall. &c. Around it grew bushes of the singular Helianthus, No. 96; and below, on the carbonaceous shale, I found the splendid Hydrophyllum, No. 93, with the Bartonia, No. 95. On the lower part of the slope I gathered, partly on a loamy calcareous crust, various Chenopodiaceæ, and a few Onagrariæ, comprising the numbers 92, 94, 100, 101, 103 and 104. There is perhaps not another Hydrophylleous plant more elegant than the above. It is about 6 inches high, robust, and divided from its base into branches, which bear ample cymes of long recurved racemes, densely covered with rather small azure-blue or deep indigo-coloured flowers, which by their contiguity give a neat semi-globose outline to the plant. The other plants, though rare, are mere botanical curiosities, except a few species of Pentstemon, which were already in seed. On the depressed plains no plants are visible except a few groups of Onosmodium, n. 164, and the arborescent species of Artemisia (cana and tridentata), fringing the margin of the adjoining plains; these are the only signs of vegetable life. Of animals we saw none, save a single prowling wolf and a solitary smoky-coloured Emberiza. The latter seemed delighted with our unexpected visit, and followed us for about 10 miles, until sunset; alighting on our hats, or travelling with us, by taking a seat on the crupper, or settling alternately on some Artemisia bush. Both these creatures probably had lost their way as we three had lost ours. Our bad luck, as we called it then, turned out good for us, for by that involuntary circuit (of about 90 or 100 miles) we evaded a party of marauding Shyenne Indians.—*Gever, in "London Journal of Botany."*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

Stove.—Little can be added to the directions already given under this head. It would be well, however, to remind the amateur especially, that he must be exceedingly cautious not to overheat the house, as this would cause the plants to start into growth, a circumstance which would be very injurious at this season. Be very particular in watering all plants under glass.

Conservatory.—This department will now occupy much attention. See that a constant and liberal supply of all winter-flowering plants is always ready to succeed each other, and that they are placed to the greatest advantage in the house: much depends on the arranging of them. This, as I have already mentioned, deserves the careful study and attention of all gardeners.—*A.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

In favourable weather like the present forward all out-door work as much as possible. Trenching ground, and planting evergreen shrubs, should still be carried on with activity, in case the ensuing spring should prove unfavourable. Dry borders that have been manured may be dug. Look over seeds collected during the past season, and clean them, when the weather is wet previous to storing. Keep lawns free from fallen leaves, sticks, &c. Roll and sweep walks, &c. *Pits and Frames.*—Keep a watchful eye over all store pots, and remove damp leaves as soon as they appear. Calceolarias that have rooted would do well to be potted off into small pots, should the weather continue fine. Give air and water as formerly directed.—*B.*

III.—FLORISTS' FLOWERS.

Attend to the routine management as previously recommended. After frosts examine the Polyanthus and Pink beds, if young plants have been put out late, it is possible that they may be raised by the action of the weather. As soon as the soil is moderately dry fasten them in their proper situations; take care that all weeds are removed as soon as they are large enough to take hold of; as the late Mr. Loudon advised, never, let them get above the "economic point," they are easier eradicated when small, and at less risk of disturbing your plants, than when they have attained some size, and their roots have mingled with those of the flowers.—Now is a good time to get together leaves, which, as the florist well knows, form a most invaluable soil or compost. No time or labour should be grudged to obtain a sufficiency, for in this all florists' flowers luxuriate. Attend to newly formed Pansy beds, and if the worms are troublesome, pour a little lime-water down their holes, which will speedily relieve you of their presence. Remove Polyanthus blooms as advised last week, and carefully observe, during a shower, whether any pots are exposed to drip; it is equally injurious to the Carnation and Picotee in frames, as to the Auricula.—*C.*

IV.—PINERIES, VINERIES, &c.

Pursue former directions with regard to Pines; little more can be added until January next. *Vineries.*—Those recently shut up for forcing should be commenced with a temperature of about 55° by day and 50° by night; during this period the wood should be kept constantly moist until they break, when the night moisture must be moderated considerably. Suffer the wood to become dry in the day, and if sunshine occurs allow the thermometer to rise 8° or 10°. If the stems of the Vines are near flues, wrap moss over that part, and keep it constantly moist. Attend to your root covering, and maintain, if possible, a slight fermentation. However it is an excellent plan to lay the covering on pretty thickly in the course of September, to arrest the departure of the accumulated heat of the past summer. Pursue similar top and root management in the earliest Peach-house; taking care that the whole volume of soil which had become dry is moistened through with warm liquid manure. See that all Vines, Figs, and Peaches, in pots or tubs, are secure from frost and access of wet. A fermenting body in a forcing Vinery or Peach-house is an excellent plunging medium for such of these as are wanted very early. The forcing of Kidney Beans may now be successfully commenced, and Strawberries introduced now into a slight bottom-heat about 12° or 15° in advance of the top heat will have a pretty good chance of success; a bottom-heat of 70° from fermenting materials is well adapted for the purpose: when they come in flower they may be introduced into the house.—*D.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Pruning the leading shoots in order to give the required form to trees against walls was explained in last week's Calendar. It now becomes necessary to advert to the management of spurs formed along the branches. In the Pear and Apple, fruit-buds are sometimes formed directly on the two-year-old portions of the branch. When such is the case, nothing is necessary with regard to them except a little thinning, if there should be more than the branch can bring to perfect fruit. But it is more frequently the case that instead of a completely-formed blossom-bud a tapering spur is only produced, which frequently goes on elongating for years: part of these should be shortened to within a quarter of an inch of their bases, whilst the greater number should be allowed to remain untouched. If, instead of spurs, shoots have been produced, they must be cut back to within an inch of their bases; and some, where numerous, still closer. Older spurs should be shortened down to the lowest fruit-buds, taking care, however, not to cut too near the latter. In short, keep the fruit-buds in view, and endeavour to remove, as much as possible, whatever is in front of them. Where there are old neglected spurs, producing only a crowded mass of foliage without fruit, they had better be thinned and well cut back; and by attending properly to summer pruning, fruitfulness will be induced. *Kitchen Garden.*—Examine Potatoes in pits, and if they exhibit no symptoms of fermentation, they may be finally earthed over, or otherwise made secure from severe frost. If they have not been put together in large quantities, fermentation cannot take place now that the weather is cool. In small pits the heat generated by a few decaying tubers among the lot is abstracted by the cool surrounding earth, and cannot possibly accumulate, as it does to a fearful extent in the case of large quantities.—*E.*

State of the Weather near London, for the week ending Dec. 31, 1843, as observed at the Horticultural Garden, Chiswick.

Dec.		Moon's Age.	Barometer. Max.	Min.	Thermometer. Max.	Min.	Mean.	Wind.	Rain
Fri.	5	6	29.514	29.470	51	30	40.5	W.

The highest temperature during the above period occurred on the 17th 1843—therm. 57°; and the lowest on the 18th, 1841—therm. 16°.

Notices to Correspondents.

Conservatories, &c.—*St Ives*—You may make an evergreen edging in your conservatory with Oxalis Bowiei, or any of the Mexican Woodsorrels, or you may employ such Cape evergreen herbs as Aristea cyanea, Anomatheca cruenta, &c., or you may employ Ferns of various kinds and Lycopods. But you will probably find stones necessary and the best for the purpose. For climbers, take the Hardenbergias, hardier Passionflowers, Mandevilla, Dolichos lignosus, Phaseolus Caracalla, Clematis Sieboldi, Clematis balearica, Tecoma australis, Bignonia capreolata, picta, or Carolinæ.——*Alcatraz*—Sheet iron will not do. You must use wood, or, which is much better, slate, or stone. Peat will do very well for plunging in. Brick rubbish is unnecessary. In placing your bed for Cucumbers over your flue, you will probably render your soil too dry. Why not place the Cucumber pots on the back of the stage, and conduct the Vines to the roof by means of a trellis. We do not see any other point which demands rectification.——*Revertens*—Gas burnt in a greenhouse will keep off frost: but it dries and poisons the air, so that the remedy is worse than the disease.——*D B B*—Metallic roofs are as good as wood, but dearer. They also demand better gardeners. Of course they are much lighter. We should hardly advise you to use metal, unless your horticultural arrangements are very perfect.

Dahlias—*E H L*—On referring to the back numbers, it appears that the reports of Country Dahlia Shows are too few, and too imperfectly given to form a summary from; if you wish to know the names of the favourite show flowers, you had better consult the report of the South London Floricultural Exhibition, at page 642 of the present volume.

Emigration—*R M S*—All European vegetable, fruit, and tree seeds are useful in New Zealand. They will go there readily without loss, if packed in coarse canvas bags, and hung up in a cabin or other well ventilated dry place: and will enjoy that fine climate when they get there.

Filbert-trees—*A Y*—As your trees do not bear, although large, you should root-prune them. ‖

Hardy Climbers—*Sub*—The following may possibly suit you: Pyracantha, Ceanothus thyrsiflorus, Berberis fascicularis, Cotoneaster microphylla and marginata, Escallonia rubra, Caprifolium flexuosum, and Magnolia grandiflora.

Heating—*An Old Sub*—If you can afford it, by all means use one single 4-inch pipe carried all round your house, and a hot-water boiler. If you cannot do that, build a common flue. As your object is merely to keep out frost, a flue is less objectionable. But you might, perhaps, effect the same object by a thatched roof, if you can provide the labour and machinery required to move it daily.

Glass—*O D*—The foreign houses have no agents here, except such as advertise in our columns.

Insects—*A Constant Reader*—I think that heat might be applied to matured trees with good effect, by means of a lighted torch or wisps of straw; or you may first rub off the scales with a blunt knife, and then wash the most infected parts with gas-tar, and the whole, if you please, with train-oil, which cannot injure the tree; but the tar must not be too freely administered. Vide vol. iii, p. 735; and vol. iv, pp. 427 and 499 of this Journal. *R*——*W*.—There is a genus of leaf-cutting bees called Megachile, whose history is given, vol. ii, p. 573; they are not very unlike the hive-bee in size and colour; but the males have palmated fore feet of an ochreous tint, and in flight they carry them, if I mistake not, in such a position that they look as if they were embracing a pebble. May not this have led to the error, if error it be, that the hive bees carry ballast? *R*. See also Curtis's "Brit. Ent.," fol. and pl. 218, for figures of the foot, &c.

Lopping—*R D J*—If the stumps left on your fine old Oaks have any spray upon them you had better leave them undisturbed. If they have none and are decaying, then saw them off close to the main trunk, pare them to a smooth face, and then dress the wounds with Forsyth's composition (see p. 24), or some such preparation. The fellow who lopped your trees should have had his ears cropped for his pains.

Mildew—*R E*—We cannot find any trace of Botrytis on your leaves of Primula sinensis. They have been attacked by some mining insect, and the hairs are somewhat in a morbid condition.

Names of Fruits—*Ald. C*—The Pigeon Apple.‡——*G P*—The Blenheim Pippin.

Names of Plants—*Vicariensis*—Some Daphne, but further we cannot say from one shrivelled flower and no leaf.——*A E N*—Aristotelea Macqui.——*H M C D*—We neither can nor will waste time in finding out the names of fragments of plants having neither flower nor fruit. If names are to be furnished by us, those who send plants must themselves furnish specimens in a state fit for examination.——*W Dingle*—Cæsalpina Sappan from Mato Grosso.

Potatoes—*S S S*—We recommend that which experience shows to have succeeded, and this is no time for experimenting. Probably the rationale of placing littery dung under the Potatoes is, that it keeps them dry, acting as drainage. We see no objection to placing it both above and below: but there is little to fear from frost.——*Enquirer*—It would not be advisable to cut down a single stemmed Potato plant for cuttings; but frequently several stems are produced, some of which may be layered or used for cuttings.——*Lyra*—We do not understand your statement. If your seed Potatoes were attacked by the "late" disease, how could they have already yielded such a crop as you describe? Perhaps you will favour us with some further explanation.

Rhubarb—*Z B*—Plant now in rich rather free soil, well trenched, and manured with rotten dung. ‖

Roses—*Magna Rosea*—You may with safety cut away now the long top-shoot, to about a foot above the buds; you may also roughly prune in the old wood, preparatory to its being entirely removed in spring.‡——*Sub*—Procure Blush Moss, Globe White Hip, Enchantress, Duc de Luxembourg, Riego, Double Yellow, Sweet Briar, Duc d'Aumale, Bernard, Rose du Roi, and Emerance. ¶

Strawberries—*R W*—You may fork over the ground between Strawberry rows at this season without injury to the plants, if you take proper care. ‖

Undergrowth for Silver Firs—*E C*—It is difficult to form an undergrowth in a narrow belt of Silver Firs, which will grow sufficiently high and thick to shut out unsightly objects behind. Common Laurels and Hollies answer the purpose better than anything else.

Vineries—*J A*—Plant your Vines next your rafters. Take care never to place next each other a strong and a weak growing sort. If you can make your border inside the house do so.

Misc.—*H L*—You should refer to some catalogue of garden plants for the information you ask. Sweet's, or Don's, or Loudon's. If we were to answer such questions, we should fill our limited space with matter of no sort of interest to anybody. A good garden catalogue is indispensable to those who wish for information respecting authorities for names.——*J Lanford*—Daphne Cneorum does not require any protection in winter; well-rotted cow-dung, mixed with peat and road-sand from limestone will form an excellent soil for it.——*A B, Bristol*—The Number would be useful.——*Delta*—Where peat cannot be procured, Aquilegia glandulosa may be grown in a light soil, consisting of loam, leaf-mould, and sand.‡——*Ely*—Soho Glass Company, 18, Crown-street, Soho.

*** As usual, many communications have been received too late, and others are unavoidably detained till the required inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

Errata—In "Ruricola's" last paper, pp. 816 and 817, for *Musca stabularis* read *Musca stabulans*, and 20 lines from the bottom for *longest* read *longish*.

STEPHENSON AND CO., 61, Gracechurch-street London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire Work, &c. &c.

DRAINING TILES.—AINSLIE'S PATENT IMPROVEMENTS

For MAKING and DRYING Draining Tiles of the FIRST CLASS.—Gentlemen having works in operation, or who are about to erect them, will find the above worthy their attention.

The PROCESS combines EFFECT with ECONOMY, as Tiles can be made ready for BURNING at all seasons; generally from ten to thirty hours, according to the nature of the clay. To be seen at Alperton, Acton, Middlesex; Mr. HOWE, Engineer. 119, Great Guildford-st, Southwark; the Polytechnic Institution, Regent-street, London. Particulars may be had from JOHN AINSLIE, Alperton, Acton, Middlesex.

The Agricultural Gazette.

SATURDAY, DECEMBER 13, 1845.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Dec. 17—Auricultural Society of England.
THURSDAY, — 18—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 24—Agricultural Society of England.
THURSDAY, — 25—Agricultural Imp. Soc. of Ireland.
FARMERS' CLUB.—Dec. 23—St. Peter's, Kent.

*** Our readers will find in another column, a Report of the SMITHFIELD CLUB Exhibition of Fat Cattle, Sheep, and Pigs, at the Baker-street Bazaar.

THERE has been a good deal of controversial writing in our pages lately on the subject of the capital needed by the farmer, *i. e.*, the amount per acre which he can invest, with the greatest profit to himself and others. It is the object of the young farmer commencing business so to invest his capital as that it shall yield him the largest annual return. And a most important matter for consideration this is, for on the capital invested in agriculture there is, doubtless, dependent much of the national welfare. But it has been urged that this is not a proper subject for discussion; that the amount per acre invested in farming, dependent as it mainly is on the population of the country, and on that of the district, as well as on their will and ability to purchase agricultural produce, is quite beyond the control of writers on the subject—that evils arising out of any existing circumstance on this head must be left to work their own remedy, and so on. But does not this mode of treating the matter sound very like the saying quoted last week by Dr. LINDLEY—"Whatever is, is right"!

One of the circumstances on which the amount of capital invested in farming depends, doubtless, is the degree of security offered to the tenant by the landlord, and is not the endeavour right to point out the true interests of both parties here. For another of these circumstances may be the ignorance of one or other of these parties of their true interests; and is it not always a noble achievement to dispel that? Certainly it is much to be wished that more capital were invested in farming; there is room both for it and its produce, as we lately showed, and that is not lost labour which is spent in pointing out the true policy of all parties on this head. We hope, therefore, that "Falcon," and "J. S.," and many others, will join in keeping alive this discussion: they cannot labour in vain as long as they write with the simple object of eliciting truth.

We may just point out one way in which a skilful investment of capital acts. Everyone knows how dependent the farmer is upon climate: it is not simply that a certain quantity of rain falls—that the thermometer falls to such an extreme in the winter months, and rises in summer, and that there is a certain liability to storms. Two districts shall be perfectly alike in these particulars—in the one the farmer may be entirely enslaved by them, while in the other he feels their influence but slightly. The reason is, that the former occupies undrained land, and the farm of the other is dry and free, either naturally or artificially. A very good instance of this is given by Prof. JOHNSTONE, in one of his District Reports. He says—From St. Abb's Head to the Mull of Galloway, there stretches a broad zone of slate rocks, over nearly the whole of which obstacles (arising from climate) to agricultural improvement exist, and a stationary or slowly advancing husbandry. But if in the midst of this broad tract of country a patch of limestone, or trap, or of old red sandstone appears, all at once the difficulties of climate appear to vanish, and heaven and earth seem to conspire in rewarding the diligent cultivator of the soil. It is the nature of the rock, therefore, on which the soils rest, and by the decay of which they have generally been formed, that has created, as it were, the climate of the spot—has caused the production of its bogs—has subjected its crops to mildew—and has made its harvests scanty and uncertain.

The limestone subsoil is just a natural development of the Deanston frequent drain system. Take a district, itself undrained and wet, and surrounded by an extensive tract of similar soil, and let its occupant, by the proper investment of his capital, drain and cultivate it properly, and it will assume the very same character, of easy cultivation in contrast to the neighbouring farms, as that which Professor JOHNSTONE found on the patches of limestone amid the clay-soils of Lowland Scotland.

This is a point, then, capable of lengthened and instructive illustration. A man farms land with a capital of 5*l.* an acre—suppose his holding and, of course, his rent, to be suddenly reduced one half—how shall he re-invest the unengaged half of his capital?—shall he resume the land of which he has been deprived, and thus double his rent again?—or is it not his interest to farm his reduced occupation doubly as well?—his rent would remain unincreased to the end of his lease, and every fresh outlay of capital, if judiciously invested, while it increased the gross produce of the farm, would *diminish the expense of its cultivation.*

WE are exceedingly anxious to make the *Agricultural Gazette* more the organ of FARMERS' SOCIETIES than it now is, especially of those which are in effect Agricultural Debating Clubs. It would, we are persuaded, be much for the benefit of Farmers' Clubs to possess a weekly periodical in which to publish their debates and resolutions—one in which they might both call the attention of the Agricultural world to the subjects which have engaged their attention, and in which at the same time they might see how far their opinions meet the views of similar bodies of practical men cultivating different soils, under different climates.

The benefit derivable thus, is, we think, sufficiently clear; and we beg to place our columns at their disposal for this purpose. Our circulation is already sufficient to enable us to assume this position if they will only avail themselves of us, and there is a similarity in our objects which should induce them to do so. The rules which guide the management of this Paper are precisely those which have been adopted by the majority of Farmers' Clubs throughout the kingdom—all subjects proper for discussion at Farmers' Clubs are proper for discussion in our columns—and it is only by publishing the experience of practical men, and the opinions on these subjects which that experience teaches, that either we or they can hope to be useful.

Utility in its true meaning—usefulness to the agricultural interest, whether by urging the adoption of means which shall raise the character and increase the comforts of the labourer—or by indicating the general principles and the particular methods of profitable farming—or by exhibiting to landowners how their own interests are concerned in the establishment of an intelligent and wealthy tenantry—usefulness in these ways is the *object* of this periodical, however small may have been the results of its endeavours. And what are the objects of Farmers' Clubs? precisely the same. They are Societies for mutual instruction—communities whose members unite for the common benefit in stating their experience as farmers on all these topics. And it is simply this character of a mutual instruction society that we have long wished our readers increasingly to assume. Our pages, we are happy to say, have this year contained communications from many practical farmers—it is on pens such as theirs that the usefulness of an Agricultural periodical must depend, and the benefit to our pages which the proposed arrangement with Farmers' Clubs would ensure is of course a great inducement to us in seeking for it.

We have a list, compiled chiefly from the results of personal inquiry, of 628 Agricultural Societies and Farmers' Clubs in England, Scotland, and Ireland, with the names and addresses of their secretaries, and with the view of bringing this subject under the notice of these gentlemen, we have sent to each a copy of this day's Paper, and a circular has also been forwarded to them, asking for such information as would enable us at once in a measure to assume the position we desire. Announcements of meetings and of subjects to be discussed, and reports of discussions and resolutions by these societies, will, it is hoped, in future be forwarded to us for the benefit of others. We shall feel highly honoured and delighted to know that Farmers' Clubs have favourably considered and resolved upon these suggestions.

Enquiries frequently reach us as to the best method of starting and maintaining Farmers' Clubs. For the first, all that seems necessary is, that the farmers attending any market town be spoken to upon the subject, and that ultimately a meeting be called to agree to certain rules. On the nature of these rules, and on the preparations which may have been made for carrying on the business of the Society, depend its probability of permanence. The following appear to be a good set of rules:—

1. That the object of this Society is the benefit of its members by the improvement of their agricultural practice. [It is not well, we think, to *say* anything about labourers, or about rewarding them with certificates and sums of money for good behaviour during a number of years' *servitude* (we do heartily agree with Mr. Colman in hating this word.) We may depend upon it that the interests of the labourer will be better served by the Society, should it be influential in inducing a better system of farming, than ever they would be by such means as money rewards. A ploughing match, however, seems to be a very fair mode of employing a portion of the Society's funds, and one which is perfectly consistent with this rule.]

2. That the officers of this Club shall consist of a Chairman, Secretary, and Committee of seven members, all to be elected annually. Three of the Committee, including the Secretary, to be a quorum.

3. That the authority of the Chairman shall suffice to preserve order during discussions, that the Secretary shall receive subscriptions, keep accounts, keep the minutes of the Society, and have the care of the library.

4. In the absence of the Chairman, the Committee shall provide a President for the evening, whose care it shall be to preserve order, and to see that at each meeting a subject is named for discussion at the ensuing one.

5. That any person wishing to be elected a member of this Club must be proposed by one member, seconded by another, and elected by a show of hands.

6. That the annual subscription of a member shall be 5*s.* (?) to be paid in advance, dating from the annual meeting *preceding* his election.

7. The club shall meet monthly on [the market-day, or some day near the full moon]. And that an annual meeting shall be held for transacting the annual business of the society.

8. That all matters of a party, political, or religious nature shall be ineligible for discussion.

9. That the management of the library shall be in the hands of the Secretary and Committee; but that books of an agricultural or horticultural character may be ordered by the Society on the seconded motion of a member.

10. That strangers may be admitted by members; but, if resident within [ ] miles of [ ], not more than once as a non-subscriber; they may take part in the debate, but not vote. That the sons of members intended for the farming business, who are under 21 years of age, shall have free admittance to the club-room.

11. That no smoking or drinking be allowed during the meetings of this Society.

12. That any member wishing to alter any of the above rules must give notice in writing to the secretary at one meeting, and propose it at the next, when it shall be determined by vote.

A very important part of the preparation to be made by any one anxious to start a Farmers' Club consists in the selection of useful subjects for discussion. A Farmer's Club will soon cease to exist if the discussions are of no use to its members. The secretary will need to obtain and engage the assistance of all who are qualified to give useful information; he will need to work hard himself, as on him will devolve the business of sustaining a flagging debate.

For the assistance of secretaries of Farmers' Clubs we prepared hand a list of 150 subjects in another page, with a few references under some of them to the best methods of treating them. It is proposed in the ensuing year to head the section of this paper which is appropriated to Farmers' Club reports with a weekly paragraph, giving full reference to the best sources of information to one or two subjects suitable for discussion.

SUBJECTS FOR DISCUSSION BY FARMERS' CLUBS.

WITH OCCASIONAL REFERENCES TO METHODS OF TREATING THEM.

1. The benefit derivable from Farmers' Clubs, with the proper constitution of such clubs, that the benefit may be the greatest. Shall matters involved in the party politics of the day be deemed suitable for discus-

sion? The causes of a falling off (where this is the case), in the attendance of members.

2. The relative merits of good, middling, and parsimonious farming.

Consider the present condition of the people for food—the present condition of the labour market for want of employment—the present remuneration of the farmer for his capital and abilities. In what does high differ from slovenly farming? It renders cultivation easier and thus more profitable—it provides employment—and increases the produce of food.

3. The advantages of the lease.

Security for the tenant—an inducement to the outlay of capital. Length of tenure causes landowners to be more careful in selection of their tenants. Consider the nature and results of both of these tendencies.

4. What are the merits of a system for securing the "tenants' rights?"

Determine what period of permanence should be allotted as a security for outlay of various kinds. How many years will pay for drainage, for liming, for boning, for the use of oil-cake, &c. See the present condition of some districts in Lincolnshire, compared with what they were formerly. On the other hand, point out the evils of running accounts between landlord and tenant, and the uncertainty of tenure which still remains, however cloaked over it may be. Read letter by "A Looker On," in a former Number of this Paper.

5. The best period and conditions under which to enter upon or leave a farm—reference being had to the interests of the landowner, and of the outgoing and incoming tenants—as well as to any risk of loss to the *nation*.

The object of all conditions should be to preserve high farming on to the *end* of the lease, and this must be by rendering it as profitable for the tenant to farm as well the last year of his lease as during any preceding one. He should get full value for dung and straw, and unexhausted labour; he should have permission to consume his roots on the farm. His successor should be permitted to do any of the labour attending his first year's crops.

6. The importance to the farmer of an acquaintance with the theory of his art.

Consider the advantages of knowing the nature of every farm operation, the certainty of its results under given circumstances.

Exhibit the opinion now prevalent on this subject as evidenced in the establishment of agricultural colleges.

7. The benefits of which science has been to agriculture.

Trace the agricultural history of the past few years: the influence of the full development of the theory of manures, and of the theory of the food of animals, on the farmer's practice.

8. The dependence of soil on subsoil, and an illustration of the connection between geology and agriculture.

See Morton on Soils, and papers by "M.S." on the Geo-agriculture of Gloucestershire, in the *Agricultural Gazette* of last year.

9. The theory of the action of manures.

The soil contains two classes of substances—one of which is in abundance, and confers on it a texture such as will enable it both to hold plants upright upon its surface, and at the same time convey to their roots, dissolved in water, the other substances present in smaller quantity in it, which act as their food. These latter substances are diminished in quantity by the abstraction of successive crops, and the soil loses its fertility. But this may be restored to it by applying to the land in sufficient quantity the substances, ascertained by analysis, of which the crops have deprived it.

10. The principles of vegetable physiology applied to the improvement of agriculture.

Consider what the seed requires to assist its germination—what the young plant requires to favour its growth and the full development of its parts—what is needed while the seed is being matured—and point out what agricultural processes are thus beneficial at the different stages.

11. What is the best seed-bed—the condition of soil most suitable to the process of germination.

See a Lecture on this subject by Dr. Madden, of Penicuick, near Edinburgh, delivered a year or two ago before the Highland and Agricultural Society of Scotland.

12. The principles of animal physiology applied to the feeding of cattle and sheep, &c.

See Dr. Playfair's Lectures before the English Agricultural Society, reported in their Journal, and Boussingault's "Rural Economy."

13. The best methods of improving the condition of the agricultural labourer.

The influence of education, of savings' banks, of benefit societies, of emigration, of allotments, of having farms of various sizes—the steps as it were in a ladder up which an industrious man may mount in the scale of society. The influence of temperance societies, of high farming, of various systems of paying the labourer. The want of cottage accommodation.

14. On the *economic* value of education.

See Dr. Chalmers's works on this subject.

15. On savings' banks and benefit societies in their influence on the labourers contributing to them.

See "North British Review," August 1845.

16. On allotments as a means of increasing the comfort and elevating the condition (?) of the labourer.

See a periodical entitled "The Labourers' Friend," and "North British Review" August 1845, and a pamphlet by Professor Henslow on "The Policy of Landlords Establishing a Spade Tenantry."

17. Should emigration be encouraged?

See "Quarterly Journal of Agriculture," p. 155, vol. 1, and "North British Review," August 1845.

18. On paying labourers partly in kind.

See Mr. Grey, of Dilstone's description of the hind system, in a late number of the "Journal of the English Agricultural Society."

19. On the propriety of reducing horse-culture by a partial substitution of manual labour.

This policy is unquestionably beneficial to the labourer, and it might to a certain extent be profitably adopted by the farmer. As in the cultivation of his headlands, and in the more thorough cultivation of some of his crops.

20. On the best methods of hiring agricultural labourers.

See a paper by Mr. C. H., in one of the Reports of the Gloucester Farmers' Club.

21. On the *professional* education of the agricultural labourer.

See various papers by the late Mrs. Davies Gilbert, upon the efficiency and success of her self-supporting schools.

22. The importance of correct agricultural statistics. How can *this club* best collect statistics of its own district? Is it advisable to correspond with other societies on this subject?

Mutual instruction is the object of the members of this club; how can this object be better fulfilled than by the compilation of a statement of the agricultural practice and experience of each? Let certain monthly meetings be devoted to this object, each member taking up a certain subject, and being assisted by a committee to assist him in obtaining local information upon it.

23. On the prices of labour, and the amount of agricultural labour *within the district* of this club. What alterations in farm practice might be profitably made, in order to increase the demand for labour?

24. On the average expense and amount of horse labour *within the district*, per 100 acres of arable and Grass land respectively.

25. What is the relative extent of Grass and arable land *within the district?* How often is the first mown, and what is the average crop? What is the rotation of crop adopted on the arable land? What are the average crops?

E. g. thus:—Total extent of the district, 50,000 acres, viz.: Arable 30,000; Grass 20,000. The latter mown on an average twice in 3 years: average produce, 18 cwt. per acre. The arable land cultivated thus, say 500 acres of Potatoes, averaging 8 tons per acre; 200 acres of Teasles, averaging 3 packs per acre; and the rest—

1 Wheat	averaging	28	bushels per acre.
2 Turnips	"	15	tons "
3 Barley	"	33	bushels "
4 Seeds mown	"	25	cwt. "

5 Seeds depastured, equal to the keep of — sheep per acre.

Every fact here might be the heading of a whole chapter of valuable information.

26. What implements of agriculture are in use in *this district?* State cases where the substitution of more efficient implements is possible.

27. Describe the breeds of cattle and sheep *within the district*, and discuss the merits of other breeds in relation to their ability to cope with local peculiarities.

28. Is it good policy, and in what cases is it so, to pay for work by the piece rather than by the day?

Give also the prices of various descriptions of piece-work.

29. What is the best system of farm accounts?

Stephens's "Book of the Farm," vol. iii., p. 1341.

30. The importance of employing land agents versed in practical farming.

This is the less necessary in a well cultivated district all let on lease. But in parts, such as the greater portion of Ireland, the evils of mere lawyers being between landlord and tenant are obvious.

31. The influence which railroads may be expected to exert on our agriculture.

Consider the advantages of having markets near and accessible—of a travelling spirit finding its way amongst farmers. Consider also the effects of a large abstraction of hands from the labour market.

32. On making and repairing roads.

33. On the making and management of fences.

See Mr. Gregor's essay in the "Journal of the English Agricultural Society;" also papers by Mr. Bravender in the *Agricultural Gazette*.

34 On the disadvantage to landlord and tenant of hedgerow timber.

See Mr. Grant's pamphlet on the actual waste of land paying no rent to the landowner. Consider the evils of shading arable lands; of obstructing drainage; of harbouring vermin, &c.

35. Advantages and disadvantages of corn-rents.

See a pamphlet on this subject, lately reviewed in this Paper. Consider how the currency laws interfere, occasionally, to spoil the connection between landowner and tenant.

36. Architecture in its relations to agriculture. Main points to be attended to in farm-buildings.

See vol. viii. of "Highland Society's Transactions." The main points are shelter and sunshine for the beasts and other stock; and a ready connection, in fact, between those parts of the buildings between which there is necessarily a connection in labour.

37. The theory of drainage.

See the writings of Mr. Smith, of Deanston, on this subject, and the essays of Mr. Parker, in the "Eng. Agr. Soc. Journal."

38. The relative merits and objects of Smith, of Deanston, and Elkington's, systems of drainage.

The one has reference to the removal of rain, falling on it from the skies; and the other, to water having, of course, a similar origin, but which reaches the land (perhaps from some distance) by means of subterraneous springs.

39. Drain-tiles and tile-machines.

See a capital paper, by Mr. Maughan, in past Numbers of the *Agricultural Gazette*.

40. The cost of drainage, by whom to be borne, its amount under various circumstances.

See information on this subject in the Report of the Lords' Committee on the improvement of settled estates.

41. Policy of breaking up Grass lands, and the best methods of doing it.

See *Agricultural Gazette*, 1844-5.

42. The best methods in which national societies can help the cause of agricultural improvement.

By exhibiting cattle and implements, or by means of disseminating amongst all the knowledge and experience (more especially in the art of *cultivation*) of the few.

43. What is "economy," properly speaking, in farming?

That mode of investing a given capital by which it shall be made to yield the largest annual return. Consider this in detail.

44. "Agricultural Economy the Antidote to Agricultural Distress."

This is the title of a pamphlet, by O. O. Roberts, on the contents of which a useful discussion may be founded.

45. What capital does the Farmer require per acre on clay and light land respectively. (Name the circumstances.)

46. Our neglect of home-made manure. Town waste-liquid manure.

See Hannam on "Waste Manure."

47. Advantages of deepening and mixing soils.

See Cuthbert Johnson's tract on this subject.

48. Relative value of manures, natural and artificial. (Naming them.)

See Boussingault and other writers on the "Theory of Agriculture."

49. The extent to which a farmer is injured for want of suitable buildings. (Naming the circumstances.)

50. Importance of uniformity in weights and measures.

"Quarterly Journal of Agriculture," vol. 2, p. 254.

51. Relative value of different sorts of fodder. (Naming them).

See Boussingault's "Rural Economy," Playfair's Lectures in the "English Agricultural Society's Journal," &c.

52. The best means of hindering adulteration of manures.

How are crimes of other kinds hindered? By the employment of a detective force. This idea may be amplified in reference to the subject in hand.

SUBJECTS AFFECTING THE GENERAL MANAGEMENT OF THE FARM.

53. The best rotation adapted to light soils.

54. The best rotation adapted to heavy soils.

55. The impolicy but occasional necessity (!) of the fallow.

56. What breed of stock is best suited to the district?

57. What breed of cattle for fatting is to be preferred?

58. What breed of sheep is best suited to the district?

59. What breed of pigs is to be preferred?

60. Our means of improving breeds of cattle, sheep, &c.

61. Whether is it better to buy artificial manures, or to enrich the dung of cattle by feeding them with oil-cake?

See reports on artificial manures made to the Highland and Agricultural Society.

62. Best method of managing farm-yard manure.

63. How to preserve and apply liquid manure.

64. Best method of improving poor pastures.

Drainage. Feeding sheep on them with roots and [illegible].

65. The policy of top-dressing.

See articles on this subject by "Oxygen."

66. Whether should dung be used long or well-rotted?

See "Oxygen's" articles and "Rural Economy" by Boussingault.

67. On clay-burning.

See paper by Mr. Randell in "Eng. Ag. Soc. Journal."

68. On bringing peat-land into cultivation.

Ascertain the practice of the fen farmers of Lincolnshire. Drainage, liming, marling, &c.

69. The diseases of plants.

See *Gardeners' Chronicle*, 1844.

70. Hybridising as a means of improving plants.

Gardeners' Chronicle, 1844, *Agricultural Gazette*, 1844-5.

71. On marling, chalking, and claying lands: methods, expense, results, and theory of the process.

72. The quantity of labour necessary, per 100 acres, to the good cultivation of clay and light lands respectively, under given circumstances.

73. The crops to which farm manure can be best supplied.

Green crops or grain?

74. The best seeds to sow for green crops, to plough in as manure.

75. Best methods of eradicating our worst weeds.

76. The use and action of lime in agriculture.

77. Best method of fallowing.

78. Artificial manures.

Each of the various artificial manures may afford suitable subject-matter for discussion: their relative influence on various crops.

79. The quantity and kind of stock that can be kept on clay soil, ½ arable, ½ pasture, compared with when it is all arable (per 100 acres).

80. The dairy versus grazing, their relative profitableness under given circumstances.

81. Under what circumstances is it advisable for the farmer to rear his own stock for fatting in preference to buying them.

82. Propriety of breeding and keeping sheep on heavy land.

83. Best methods of depositing seed, broadcast sowing, drilling, dibbling?

84. Best methods of increasing our stock of manure.

A forced high cultivation by purchased manures for one year, will, by its influence on the straw and green crops of that year—on the crops, in fact, to be consumed by stock—increase the quantity of dung so as to render that method of farming permanent for the future at no additional expence.

SUBJECTS CONNECTED WITH THE CULTIVATION OF PARTICULAR PLANTS.

85. The best varieties of Wheat to grow.

See Col. Le Couteur on Wheat; an article by Mr. Morton in the 1st vol. of "English Agricultural Society's Journal;" Sir G. S. Mackensie's pamphlet and papers on this subject in the *Agricultural Gazette*, &c.

86. The best methods of preparing seed.

Campbell's steeps: Salt and lime, sulphate of copper (blue vitriol), &c.

87. The proper quantity to sow per acre, and the best seed-time.

Hewitt Davis's pamphlet, &c.

88. The crop after which Wheat succeeds best; fallow, Grass, or root crops.

89. The proper treatment of the Wheat crop during its growth, the policy of top-dressing and hoeing, of spring mowing, or eating down with sheep when too forward, &c.

90. When and how to reap Wheat.

91. The cultivation of Bean and Pea.

92. The best varieties of Barley and Oats to cultivate.

93. What treatment should land receive for Barley and seeds?

94. The best mixture of seeds and Rye-grass, Italian or other varieties, for a one-year, or two-year, or permanent pasture.

95. The relative value of Mangold Wurzel, Swedish and common Turnips and Carrots, as food for cattle, &c.

Consider the difficulty of determining this in these roots, each attaining their best state as food at different times.

96. The best varieties of the above roots to grow.

97. The cultivation of the Carrot.

98. The cultivation of the Mangold Wurzel.

99. The cultivation of the Swede and common Turnip.

100. Relative merits of horse and hand-hoeing. The advantage of *deep* stirring in drill-culture.

101. How to harvest roots.

102. Best way to consume roots.

Whether on the ground or cut—whether under shelter or not—whether by sheep or beasts.

103. On stall-feeding as against feeding in yards.

See experience of East Lothian Farmers.

104. On shed feeding of sheep.
See the account of Mr. Childer's experiments; of those by Mr. Barstable. Ascertain the practice at Whitfield farm, near Wotton.

105. Whether should food be given steamed or raw? What kinds, and to what animals?
See *Agricultural Gazette*, 1845.

106. The cultivation of the Potato. Selection of sorts.

107. The disease of the Potato.

108. The cultivation of the Cabbage—of Rape or Cole—of Kohl rabi.
Best methods of preserving and of consuming them.

109. Best substitutes in winter in case of a failure of root crops.
Cake, Linseed, and straw, &c.

110. How to renovate Clover-sick lands.

111. With what to fill up blanks in Clover-fields

112. Cultivation of Lucerne and Sainfoin.

113. On laying down land as permanent pasture.
See Leader, *Agricultural Gazette*, 1845.

114. On the cultivation of Flax.
See Mr. Sproule's letters, *Agricultural Gazette*, 1844. Mr. Dickson's letters, *Agricultural Gazette*, 1845.

115. On the cultivation of Hops.

116. On the cultivation of Hemp.

117. On the growth of seeds, Canary, Clover, Radish, Sainfoin, Lucerne, &c.

118. Proper management of pasture-land. Best method of hay-making.

119. On Irrigation.
Low's "Elements of Practical Agriculture." Stephens on Irrigation.

120. On methods of extirpating slugs and wire-worms.

121. Natural history of the wire-worm, Turnip-fly, &c.
Essays by J. Curtis, Esq., "English Agricultural Society's Journal."

122. On bones as a manure, bones and sulphuric acid, &c.
See the writings on this subject of Mr. Hannam, of North Deighton, Wetherby.

123. Does fibrous covering stimulate vegetable growth, and how?
See *Agricultural Gazette*, 1845, giving the statements on this head of Goldsworthy Gurney, Esq., Launceston.

SUBJECTS CONNECTED WITH THE INSTRUMENTS OF FARMING.

124. The best method of keeping farm horses in summer.

125. The best method of keeping farm horses in winter (comparative advantages of stall and shed-feeding).

126. The policy of employing ox-labour instead of horse-labour.

127. Ploughs and ploughing.

128. The best construction of harrows, cultivators, horse hoes, &c.

129. The efficiency of various kinds of rollers and clod crushers, and their usefulness in various cases to the farmer.

130. The cart and waggon in their relative merits as machines of carriage.

131. What is the best mode of construction for the thrashing and winnowing machines.

132. Chaff-cutters, Turnip-cutters, and corn-bruisers.

133. Drills, dibbles, and sowing machines.

SUBJECTS CONNECTED WITH THE MANAGEMENT OF CATTLE.

134. What is the proper daily treatment of the horse.

135. On horse-shoeing.
"Quarterly Journal" for August, vol. ii., pp. 75, 214.

136. The diseases of the horse.

137. The best method of rearing cattle with a view to early maturity.

138. The details of stall-feeding—policy of using Mr. Warnes's system of box-feeding, and his porridge or jelly.

139. The diseases of cattle.

140. The treatment of ewes during the lambing season.

141. The details of winter-feeding sheep.

142. The diseases of sheep.

143. The details of pig management, where the object is pork.

144. The details of pig management when the object is bacon.

145. The diseases of pigs.

146. Dairy management.

ADDENDA.

147. The management of the orchard, and cider making.

148. The management of poultry.

149. The policy of a labour-rate.

150. A library for a Farmer's Club.
See Stephens's "Book of the Farm," vol. i., p. 6.

The following is a list of works constituting a good agricultural library for a Farmers' Club.

PERIODICALS.

Annual and Quarterly.—1. Journal of the English Agricultural Society. 2. Quarterly Journal of Agriculture, with the Transactions of the Highland and Agricultural Society. 3. Transactions of the Irish Agricultural Improvement Society. 4. British Farmers' Magazine. 5. Johnson and Shaw's Almanac.

Monthly.—Farmers' Magazine, Agricultural Magazine, the Veterinarian.

Weekly.—Gardeners' Chronicle and Agricultural Gazette—Mark Lane Express—New Farmers' Journal—Dublin Farmers' Gazette—Irish Farmers' Journal.—Besides these there are many valuable local periodicals, such as the Ayrshire and Renfrewshire Agriculturist, the Scottish Farmer, &c.

WORKS ON THE THEORY OF AGRICULTURE.

Boussingault's Rural Economy—Chemistry in its Relation to Agriculture, from the "North British Review"—Daubeny's Lectures—Davy's (Sir H.) Agricultural Chemistry—Griesenthwaite's Theory of Agriculture—Henslow's (Professor) Letters to Farmers—Johnson's (Professor) Lectures on Agricultural Chemistry and Geology—Liebig's Agricultural Chemistry; do. Organic Chemistry—Lindley's Theory of Horticulture—Marcet's, Mrs., Conversations on Vegetable Physiology—Morton on soils—Petzholdt's Lectures on Agricultural Chemistry—Reid's Chemistry of Nature—Solly's Rural Chemistry—Squarrey's Agricultural Chemistry—Trimmer's Chemistry for Farmers—Tower's Domestic Gardener's Manual—Topham's Chemistry made Easy—Von Thaer's Principles of Agriculture—Whitley's Agricultural Geology.

WORKS ON THE PRACTICE OF FARMING.

Agricultural Reports of Counties to the Board of Agriculture, 1813—Anderson's Essays—Anderson's Recreations—Alpaca, by W. Walton—Atkinson on the Agriculture, &c., of Australia—Beatson's (Major-General) New System of Cultivation—Blacklock on Sheep—Bayldon on Rent and Tillage—Blacker on Small Farms—Cooke on the Value of Land—Cleghorn's System of Agriculture—Curwin's Hints on Agricultural Subjects—Cobbett's Rural Rides—Cobbett's Woodlands—Code of Agriculture, by Sir J. FOREST PRUNING.

In the whole round of subjects bordering upon agriculture, there is hardly one which has been more unsatisfactorily handled than that of the pruning of forest trees. It would be difficult for any one seeking for information, either from the works upon arboriculture or from general opinion, to come away with any other feeling or conclusion upon this point, than that which leaves him just where he set out, viz., that "Doctors differ." Many, indeed, are the interesting subjects that have been overlaid and stifled by this stupid and stupefying answer. The only conclusion from this conclusion, is either that the question has, in fact, made very little scientific progress, or else that the contending parties have not really defined the subject and object of their discussion. The tall sky-scraping Elm or Poplar, ruthlessly stripped of every branchlet, that tower up, "small by degrees and beautifully less," in the farmer's hedgerow, does not stand in more ludicrous contrast with the wide-spreading Beech or Oak in the "old park" of some ancient baronial domain, than do the written and spoken opinions of the existing authorities on each side as to the adoption or rejection of the pruning-knife. Instead of investigating principles, they all appeal to the results of individual practice, or what is still worse, blindly and authoritatively refer to some recorded opinion. Now, inasmuch as the results of practice vary with every variety of tree, soil, climate, proximity, exposure, purpose, and a great many other obvious causes of difference, and inasmuch as recorded opinion varies with all these inherent causes of variation, it is not to be wondered at that the strife remains still, as ever, *sub judice*. But, surely one might have hoped better things of a matter which has received such ample illumination, collateral and direct, from the labours of such men as De Candolle, Saussure, Macaire, Du Trochet, and many others who have (if one might dare to say so of any physical inquiry), almost exhausted, by analytical investigation, the principles of physiology, upon which, and upon which alone, correct practice can be founded.

The empiric who trims up a tree like a Hop-pole, and the sagacious sciolist who tells you with an air of pompous discovery that "Nature should be left entirely to herself," and be allowed, if it so please her, to rot the decayed lower branches into the heart of the stem, do poor dame Nature equal injustice. Nature laughs at a servile worship, as much as she frowns at ignorant mutilation. The mind of man is an important part of Nature, and was intended to operate upon the material she supplies, and to direct its growth and increase towards the object required by his necessities and use. To prune a park tree (whose purpose is free beauty, and even bold extravagance of outline) as you would a tree in a plantation (whose purpose is clean, long, straight, sound timber, for the saw-pit) is as obviously absurd in theory, when once pointed out, as its converse is in practice; so far from forbidding the removal of the lower branches, in a plantation, Nature herself suggests it, by killing them, which she does not do in the park. Nothing can be more judiciously and kindly discriminating than the opinion which she delivers upon the subject, if man will but open his eyes and read it. "But if Nature herself kills them, why employ the knife?" Why, for the same reason that you cut your nails and your hair, and shave your beard, because it is more convenient to do so; and because the great suggester, who gave you the perception and the means, shows by the consequences that she not only permits, but intended and approves it. If you leave the dead branch to decay into the stem, you will have a dead knot running into the very heart of the tree, which drops out of each plank when the timber comes to be sawed up, and shrinks in the seasoning. The same Power that gave branches to the tree gave us eyes to see, and a mind to prevent for the future the inconvenient consequences of past neglect.

But are no branches, then, to be taken off but such as are dying! Not so. The same perception of future convenience suggests the removal of a double leader, or of a branch, which from accidental advantages of space, light, or aspect, has obtained disproportionate growth; or which, relatively with some contiguous tree, is doing more harm than its removal would to the growth of the first tree; or, lastly, where the internode above the lowest tier of branches is so much smaller in girth than the stem below them, that the disproportion requires to be reduced in order to produce more regularity of girth. This is easily accomplished by the removal of the whole or a part of that tier of branches. Why it does so, and how it does so, are questions, the answer to which is the basis and true principle upon which the whole art of pruning depends. Briefly stated, it is this. The leaves are to the tree what the sucker is to the pump. The roots and stem are the pump-tree, immersed in the soil, which is the well containing the moisture. The sun is the man at the winch, who, with his two arms (light and heat) works the pump. This is no idle metaphor; the analogy is as close as truth can make it. It is no imaginary or hypothetical theory: it has been proved step by step, under the incontestible evidence of repeated unfailing experiment. The moisture is drawn up into the leaf, and we call it sap. The sun exhales off the superfluous water by heat from the upper surface of the leaf, leaving the sap thicker with the salts and other substances, such as soda, potash (and carbon?) that it contained in solution when taken up by the roots. Meantime the light stimulates the pores on the under side of the leaf to a mysterious capacity, which they possess of absorbing the carbonic acid of the atmosphere, appropriating the carbon, and re-emitting the oxygen: this is a second, and probably the main source of carbon (according to Liebig the only one) enriched by which the sap (now called cambium) begins to descend, and as it descends, deposits its rich stores, thus elaborated by the leaf, and adapted to its new existence, as young wood (alburnum) in a thin layer between the inner bark (liber) and the outer (last year's) layer of wood, throughout the branch, and the whole of the stem which lies below that branch. Thus it is by the descent of the sap that the stem increases in girth. Every leaf that is taken off the tree, reduces, *pro tanto*, the growth of the branch it grows on, and that part of the stem which lies below that branch. Cut off a branch, or a whole tier of branches, and you reduce considerably the immediate increase of girth in the stem below, but not above, consequently the proportionate girth above the removed tier increases for a year or two, and a greater equality of girth is obtained. But, then, it is replied, this equality is obtained by a loss of increased bulk to the lower stem. To a very trifling degree: for there is a property called anastomose, in vegetable structure, precisely analogous to the well-known power in animal anatomy, by which when a main artery is tied (as in an amputated limb, or the operation for the cure of aneurism), the small varicose arteries, almost invisible before, are stimulated by the checked blood, swell in dimension and carry on the circulation as perfectly as ever. Now, as the roots of a tree correspond to the quantity of foliage above, if you cut off a branch, you leave a superabundance of root-power. The process of anastomose immediately commences, and the sap which would have gone to the nourishment of the lost branch, finds its way into the upper part of the tree, provided there be still sufficient vigour of foliage left to work it up, and bear the stimulated supply. But this is one of nature's mysterious and beautiful supplementary processes, which must not be pushed too far; for if too many branches be removed at once, as in "stripping up" a tree, the superabundance of roots finding no responsive power in the miserable remnant of foliage, begin to rot for want of vital action, and permanent damage is caused which the tree never entirely recovers. It is needless to add, that this suggests the propriety of early and very gentle and gradual use of the knife, where it is necessary at all.

It is an error to suppose that the same rules do not apply to the Fir-tribe as to other deciduous trees. There is not the slightest foundation for the supposition. In a thick plantation their lower branches soon begin to die, and should be taken off neatly at the stem whilst there is still vitality left in them, and leaving no jagged wound, that the bark may quickly cicatrise over it: but to prevent the too rapid decay of the lower tiers, thinning must be at the same time attended to, for the purpose of admitting light. But thinning, which is often sadly neglected, may also be overdone, especially in a young plantation which is very susceptible of the change of temperature it produces. Both theory and practice are favourable to the postponement of thinning and pruning, until the severity of winter is over. Cicatrisation takes place only in summer and autumn. To prune a tree after they are over, is an useless exposure of the wound to an extra winter's frost beyond what is necessary before the healing process commences, and injures the plant by reduction of its temperature, which has been proved by repeated experiment to be in winter above that of the atmosphere. The great object, in fact, in the pruning of trees intended for the saw-pit, is to prevent dead knots. Brief exposure and rapid

cicatrisation are the only things that will prevent this. There are many reasons which concur to point out the period when the tree has just got into leaf, as the best time for removing small branches. If cut off before the buds are burst, shoots will be thrown out around the wound, causing future trouble: this is not the case after the leaf is out. In making the cut, the edge of the knife should lean a little outwards; for if the cut be quite vertical, a nidus will be left for insects during the ensuing winter upon the under-lip of the bark that closes around the wound. This should be avoided, as they eat into the tender juicy formation, and arrest the future granulation.

This, of course, all applies to those branches only that are small enough (compared with the stem) to be cut close off at once. The gradual excision of large branches by the system oddly enough called "fore-shortening" in previously neglected plantations, is a process requiring so much time, care, and nicety of judgment that it deserves a separate consideration. —*C. W. H.*

POTATO DISEASE IN THE ISLAND OF ARRAN.

In this island, and in many other parts of the highlands of Scotland, and elsewhere, a disease prevailed among the Potatoes for many years, but of a different description from that at present so severe here and elsewhere. It began in 1829, and continued till 1842, doing more or less damage yearly. During the first three years, there was not nearly half a crop of these roots, and the deficiency was great in general, in most places, for years after; but that sort of Potatoes called "Cups" was introduced from Ireland, and although the failure in this kind was not nearly so great as before its introduction, the produce from them was not great for years; still, they did not fail to produce moderate crops, while the other sorts hardly vegetated at all.

This disease, as I have said above, was very different from the present. The Potatoes in the pits and houses were affected, very generally, with what was called the dry rot, the rotten parts being a dun yellowish colour and dry; but it is remarkable that the eyes still retained the power of vegetating, and did grow when planted, putting up dark purple stalks about the thickness of quills, which rarely produced any Potatoes under ground, but a number of small ones, of the size of Peas, above it, clustered on the stalks. The same thing very often happened, even when Potatoes apparently sound were planted, and the fields appeared as if only a few Potatoes had been planted here and there in each drill, as the defective ones made no appearance at a little distance, though they did send up very slender shoots, as above described. This disease gradually wore away, and for three or four years past there was little appearance of its existence, although the principle of life, in most varieties of Potatoes, was hardly so vigorous as it was before the disease commenced. The crop of the year before this malady showed itself was unusually great. Of course no Potatoes, but for experiment, were planted, except such as seemed sound; but it often happened that those planted in the morning failed, while the same sort, cut at the same time, and planted immediately adjoining, grew well, and *vice versâ*. During the prevalance of the disease, I and others imported Potatoes from districts on the mainland, where the disease had never shown itself; and it is remarkable that though beautiful roots, the crops from them were almost uniformly more affected with the disease than those planted with our own seed, among which it was strongly marked. So much was this the case, that we ceased to import seed Potatoes, and planted only such of our own raising as appeared, at the time of planting, to be sound and good. We never plant Potatoes two years in immediate succession on the same ground. So very fatal was the disease in many instances, that not a fifth part of the usual crops were produced; and, as might have been expected, it produced great suffering among the poor in the highlands of Scotland for several years. The crops of Potatoes both in the present year and in the last were very great in this quarter, and I understand from a number of the tenant-farmers here, that in many instances the same disease which at present affects these roots was observed last season, though not by any means to the same extent as in this season.

It is therefore not entirely a new disease here. It may be observed that on the crop, a very great one, which immediately succeeded the failure, which I have shortly above described, the Potatoes produced an immense quantity of seed, or, as they are called here, "bullets," and the same fact was noticed on the crop of 1844. For several years previous to 1844, there were very few "bullets" on the Potatoes. I may further state that during the seasons in which the above-described disease prevailed, I raised a variety of sorts of Potatoes from the seed; but as soon as they were fit for planting for a crop, the disease, or dry rot as it was called, was just as severe on them as on the Potatoes from which they were raised. From these facts I hope, and would infer, that the present disease, though an extremely distressing one, will gradually wear away; as I cannot believe that any vegetable, in present cultivation, has entirely lost the power of reproduction. One of the great revolutions that have taken place on the earth's surface would I think, be required to bring about so important a change; and if such did occur, Potatoes would not alone be the sufferers.

As the most easy and likely means of preserving at least a portion of so bulky a crop as the Potatoes are, the farmers here have put them up in very narrow pits and covered them with rooty turf, which they remove in dry weather, so that the tubers have the benefit of the sun and air; and remove such as appear affected with the disease. In this manner a great deal of the water contained in the Potatoes will be carried off, and thus brought into a dry state, in which they are more likely to be preserved sound till the time of planting. As there is little frost here, this process of drying may be continued, if found necessary, during great part of winter and spring. There are very few Potatoes in this island but are affected, more or less, with the disease so common in almost every part of the empire, and in not a few instances the loss is almost total. The early garden Potatoes are generally almost free of this malady.

I very much approve of planting Potatoes early in winter. I did so last year, and had a very good crop. I believe that the seed is more likely to be preserved in this way than in any other. It is advisable, however, to plant whole Potatoes of the size of pigeons' eggs, or a little larger, rolled in powdery lime before planting. I followed this plan, and found it to answer well.—*J. P. Whitehouse, Arran.*

ON THICK AND THIN SOWING.

The question of thin sowing is a most important one individually and nationally, involving the consideration whether we do not bury in the soil every year wastefully and prejudicially 3 million quarters of corn. I have endeavoured to bring my mind quite unprejudiced to the examination of this question, and present, for the consideration of my brother agriculturists, some facts and reasonings with a view to stimulate unprejudiced experiments, which, I hope, will be fairly tried on a moderate scale, for an average of seasons, in every district.

Before proceeding to the general question, I would propound as theories, supported by facts observable within my own knowledge on my own farm,—

1. That the tendency of thin sowing is to increase the size, vigour, and perfect development of the stem, ear, and kernel, prolonging its growth, and consequently delaying its maturity.

2. That, on the contrary, thick sowing hastens ripening, but renders the plant in every respect more diminutive and less productive.

3. That a large quantity of seed will not produce so large a crop in a short time, as a small quantity of seed in a longer time; the supply of manure, soil, and climate being alike to both.

4. That dibbling delays the maturity of a corn-crop, but promotes its tillering.

5. That drilling and broadcasting hasten its maturity, but diminish its tillering.

6. That the propriety of thick, moderate, or thin sowing must depend on the nature, quality, and condition of the soil; the comparative temperature and moisture of the climate, and the period at which it may be most convenient to the farmer to put in his seed. The quantity that would be judicious in the luxuriant soil and moist warm climate of the south and west of Ireland and England, would most probably be quite insufficient in the highlands of Scotland, or in our cold and dry northern and eastern districts, with long winters and short summers.

7. That neither a large nor a small quantity of seed will produce a full crop if the soil contains only food enough for half a crop.

8. That a small quantity of seed sown at a proper early period, with deep and frequent cultivation between the widely-placed rows, will produce a much larger return than an abundantly-seeded close-sown crop in which the horse-hoe could not be worked. Tillage here supplies manure.

9. That by varying the quantity of seed we sow in our different fields, we can cause an interval of succession in their ripening, and so prevent their all coming ready for the sickle at the same time. This is convenient at harvest time.

10. That on land that has been subsoiled or trenched for the previous root-crop, the Wheat-crop is delayed in its maturity at least one week. This is worth noticing—the fact being obvious in several of my fields this season. The cause is a more vigorous and prolonged growth; which instructs us that in well-drained deeply-cultivated soils we may expect greater bulk, and should therefore give longer time for growth by earlier and thinner sowing.

I am convinced that thin sowing must rank with deep drainage and deep tillage as one of the bases of our agricultural structure. To Jethro Tull in ancient, and to Mr. Hewitt Davis in modern times, belongs the honour and credit of this discovery. The latter gentleman's essay (rejected by the Royal Agricultural Society) supported by long and well-proved practice—is one of the most important agricultural documents ever promulgated—second only to deep drainage and deep and frequent tillage, on which it is dependant. The mere rejection of this document is a great honour to Mr. Davis; for it proves his practice to be so far in advance of his own times, that cautious men are afraid to go with him, even in his facts. It was, no doubt, the fear of a great responsibility * that caused Mr. Davis to lose the prize to which he aspired: but his honour will, and must, nevertheless, soon come, and be followed by an amendment of our at present wretchedly defective system of tillage. I will now proceed to give reasons for the opinions I have expressed. In various portions of my fields I have dibbled and drilled Wheat at the rate of 2¾ pecks, 4 pecks, and 5 pecks per acre. These have been sown in December and January. It will be readily admitted that if I can obtain a crop from such late and thin sowing in a winter like the last (which has been almost a continuous frost since the time of sowing until May), the experiment has been tested under the most adverse circumstances. In fact, so severe has it been that, on the north side, or round edge of the ridges in one well-drained field, some portion of both the dibbled and drilled thick and thin sown have each perished where the snow was blown off, and the birds were most persevering in their attacks.

So thin (but not yellow) have looked my Wheats that we have been most abundantly pitied or chaffed by our numerous visitors, until my late tenant (who manages for me) absolutely fancied they must be right, and quite desponded. 'Tis true, here and there a visitor has remembered that his Wheats, which he had half determined on ploughing up in early spring, owing to their wretched appearance, have always turned out his best crops. And we have been occasionally consoled by a stray remark, "Oh! it will get together, there will be Wheat enough:"—"there will be more than people expect;" and so on. Whilst another has remembered that his luxuriant crop of April has, in a cold and wet July and August, been laid, matted, and rotted, or destroyed. However, amid this storm of conflicting opinions, I have calmly and confidently looked on as an unprejudiced observer depending on facts and common sense, and not on opinions.

I have taken some pains to ascertain how results, adverse to the principle of thin sowing, have been obtained. The following are illustrations amongst others:—Well, you sowed 3 pecks per acre: how did it answer?—We did not get quite so much as with 8 pecks. Did you give it more than the usual hoeings?—No, we gave it two hand-hoeings. Were there not many weeds?—Oh, yes, a great many more than usual. It did not occur to you that the ground being so much less covered in the plant's early growth, that it was necessary to prevent entirely the growth of weeds by additional hoeing?—No, it did not. And do you consider this a fair trial?—We do. Why is Wheat an exhausting crop? and why are roots not considered a scourging crop, although they really are much more so than Wheat? We may safely compare the undisturbed shaded cold and sour ground under a dense Wheat-crop to soil shaded by trees. There is a foul fusty smell in soil that has been long excluded from light, very different from the healthy nosegay of a summer tilth. In one case we see the result: in the other we only see the Wheat. We admit that the benefits of light, air, and evening dews are great; nobody denies the excellence of a clean fallow. That atmosphere which has disintegrated and reduced to dust the solid marbles and cities of antiquity, will alike chemically decompose the particles of earth we expose to its influence. Frequent tillage and comminution is our best and cheapest manure; and yet we obstinately decline following Jethro Tull's and Mr. Hewitt Davis's plan of a fallow amongst the growing corn-crops. This is the great secret of Mr. Davis's subsequent good crops. The soil is ready to receive them. Were we to treat our Turnip-crop as we do our Wheat-crop, where would be the following crop? Imagine a crop of Turnips on the ground 10 months out of the 12, not thinned, and only a couple of scratchings, called hand-hoeings, bestowed on it. Oh! but a Turnip swells so. Well, does not a Wheat plant swell into a giant if you will but give it space and time, with deep and frequent cultivation and ample food? Would you have grown into your well-developed form had you been cramped in the clothing of your boyish days, and had not more room been given to you as you advanced in size! The struggle for air, light, and food is quite as great amongst a crowded Wheat-crop on poor land, as it was amongst our unfortunate countrymen when confined in the black-hole at Calcutta. Like them, many perish in the struggle. The puny ears, shrivelled kernels, and spindling stems, are caused by the plants striving to get their heads above their companions, whose pressure on their sides forces them up to a longitudinal decrepitude. Here let me quote the truthful, eloquent, and impressive words of Professor Johnstone:—"The light of the sun, in the existing economy of nature, is indeed equally necessary to the health of plants and of animals. The former become pale and sickly, and refuse to perform their most important chemical functions when excluded from the light. The bloom disappears also from the human cheek, the body wastes away, and the spirit sinks, when the unhappy prisoner is debarred from the sight of the blessed sun. In his system, too, the presence of light is necessary to the performance of those chemical functions, on which the healthy condition of the vital fluid depends." Who after this will advocate the exclusion of light by thick sowing! A blanched Sea-kale is a powerful illustration of the effect of absence of light.

I do not consider the system of thin sowing can be

* In 19-20ths of the heavy, undrained, weedy, half-tilled lands of this country, thin sowing would be in wet winters a ruinous affair, because we well know in such seasons on such lands, much of the seed rots or perishes. In fact, I have often heard farmers say, the water lies in, or follows the line of drill, and yet such men never dream of drainage. But on chalks, limestones, sands, gravels, and other self-drained soils, thin sowing (or in preference than dibbling, cannot fail to be profitable, provided the horse-hoe and hand-hoe (with heavy autumnal and spring rollings) keep the intermediate surface open and free. It was, no doubt, a consideration of these circumstances that caused the Society to decide as they did.

profitably carried out with the ordinary hand-hoe. My plan is to use Garrett and Son's horse-hoe, which covers a whole ridge, 7 feet 2 inches wide, and will, with two horses, disturb deeply 10 acres per day, and remove all weeds from between the rows. I shall use it, weeds or no weeds, whenever the ground is dry, for the purpose of fallowing the land, and facilitating the escape of moisture and change of air by percolation and evaporation; whilst the warm night dews are in summer admitted into the open comminuted surface. Unless this is done thin sowing must prove a failure. The horse-hoe should precede and succeed such little hand-hoeing as may be necessary between the plants. It is a singular corroborative fact that our dibbled Wheat (on the heavy land, not on the light land), which looked best all the winter, during the spring rains turned yellow, which I attribute entirely to our being unable to horse-hoe between the rows. The thin sowed drilled, which had been horse-hoed, looked beautifully green on the same description of soil. I am having Newberry's dibbling machine altered to cover the whole stetch, 7 feet 2 inches, with 1 foot distance between the rows, so as to enable me to use Garrett's horse-hoe. I am not aware there was any other cause for the yellow appearance of the dibbled portion.

Horse-hoeing, or opening of the soil, I consider indispensable with all crops, but especially dibbled Wheats on heavy land: being deeply rooted, they are deprived by a tenacious surface of a proper supply of oxygen, &c, without which the roots cannot perform their functions.

In light or mellow soils there is no such risk. In such soils all corn should be dibbled; but until I have an opportunity another season of trying dibbled Wheat on heavy land, well horse-hoed, I am not prepared to say whether dibbling with the machine in a late cold and wet season is advisable on heavy lands. I am convinced drilling is to be preferred to dibbling, if we get a cold wet spring and cannot use the horse-hoe. Such soils (even though recently drained) in wet cold weather become so much solidified as to prevent evaporation, and consequently percolation, and the internal circulation of air, unless the surface is frequently opened by cultivation. Even in drained heavy land the surface should be kept well open, for when the surface is sodden or solidified, the internal water cannot descend to the drains. As an illustration, liquid will not flow out of a cask unless we let in air above by removing the vent peg. The deeper the roots the more they suffer.

It may be admitted that, in such rare seasons as the last, dense crops were productive, because from the extraordinary drought, innumerable cracks or fissures were the means of permitting extensive percolation and evaporation, but against such a season must be balanced those more commonly wet ones, which cause loss by mildewed and laid crops. But even last year, I know of thin crops being the most productive on well cultivated soils. The deficiency in the number of stems is compensated by the length, size, and uniformity of the ears, and the greatly increased number of kernels, 110 of which I have frequently counted from one Wheat ear. The blade or flag leaf is also much larger.

It is well known that on poor light lands Wheats never tiller or branch so well as in heavier soils; there is a tendency to a more rapid or surface growth. In order to prevent this, they should, in such soils, be well rolled when sown, and as soon as they are above ground, and again shortly after, as well as in the spring. This checks their upward growth, and obliges the tap root to descend into the subsoil, out of the way of frost and excessive drought, for there are two roots to Wheat, a fibrous surface root and a downward tap root, which are connected by a neck between them (varying from 1 to 6 inches, according to the depth at which the seed is placed).

For want of this autumnal rolling, many thousand acres of light land Wheats have this severe winter been killed by the frost which perished the roots; especially on the north side of the ridges. A farmer who lost 50 acres told me to-day, that where he rolled in autumn he saved his Wheats, having previously observed that where cart-wheels had passed over the land, the plant was vigorous. No implement answers so well for this purpose as Croskill's clod roller. Of course, in heavy land such rolling cannot be required in a wet autumn; in a very dry one it might be useful, although such land would seldom require pressure.

Supposing we are satisfied to receive as a crop 5 quarters, or 160 pecks of Wheat per acre,—what ratio of increase do we require from each kernel, assuming that we sow 2 pecks per acre? Why 80 kernels, or one full sized ear. (I saw some ears last season containing 110 kernels.)

Now where is the man to deny that the average produce from each kernel may be, instead of 80 kernels, from 500 to 2000 or more, with ample space, and absence of weeds, wire-worm, and game.

It is quite clear that on the tillering or branching of Wheat, depends the whole question—that branching or tillering is indicative of vigour in the roots, both tap and fibrous. That vigour can alone be produced by deep drainage, early sowing, frequent, deep, and clean cultivation, a total absence of weeds, occasional top-dressings of manure, if the land is not of rich quality, or the plant be weak; and on light land, ample rollings. With the present defective system of farming, thin sowing must be a failure.

No doubt peculiarity of seasons, such as mild growing winters and moist summers, or severe winters and very dry summers, must always occasionally be alternately favourable or unfavourable to both thick and thin sowing; but that does not alter the general average rule or principle.—*I. J. Mechi.*

(To be continued.)

THE CULTIVATION OF ROOT CROPS ON HEAVY LAND.

We are now to inquire into the best mode of cultivating our strong and tenacious soils for the growth of root crops, and likewise to what extent the cultivation of them can be carried with profit on such soils. I believe it will be readily conceded that roots can be produced on heavy soils, and large crops of them too, by good tillage and careful cultivation; but then comes the grand and puzzling question, "Can we consume the crop when we have brought it to maturity, without positive loss to our pockets, and ultimate injury to the land?" Some time ago I certainly should not have attempted to answer the question, or if I had replied to it at all, it would have been by declaring my conviction of the uselessness and folly of the attempt; but now the case is far different: we have discovered a mode of taking up and stacking away the roots when arrived at their full growth with ease, and certainty of their preservation till a late period in the spring: and we have also by the result of experiments carefully tested and duly registered, found out that sheep as well as other stock, when housed and kept warm and dry, will thrive faster and with less food than when folded in the usual way in the open field. I must remark likewise that the drainage of moist clay soils (which formerly were, from being saturated with surface water, difficult to cultivate) is now well understood; without which drainage the necessary operations of husbandry cannot be carried on to good purpose; and without which the cultivation of roots should not be attempted; for if attempted, it will not be successful. I am sorry that I am not enabled to state as the result of my own experience, facts on which you might safely proceed, but that I shall be compelled instead to resort rather to hints and suggestions for your adoption or rejection. These I leave to your better judgment, and to the test of future experiment and experience.

I will commence then by telling you what I did for upwards of 30 years since, when I began to attempt to be a farmer and a grower of root-crops, and you may take me as an example to avoid: shun my errors. Well then, being aware of the great advantage of a plentiful supply of roots as food for my stock during the winter months, whereby to save my hay-ricks and increase my heap of dung, I divided my arable land into eight parts, taking as a rotation of cropping—Turnips, Barley, Clover, Wheat; Cabbages and Beet, Oats, Beans, or Vetches; and lastly Wheat; thus a fourth of my arable land was annually producing a root crop. This went on for a bit; I grew roots, good ones, and plenty of them; but how were they to be got off the land, at that time not thoroughly drained? I will tell you how it was; got off they must be, for it was out of the question to think of feeding them off where they were growing; so I pulled them and fetched them away in carts as I wanted them, let the weather be as it might, wet or dry. You will say I got into the mire; I did so most certainly: but this was not all, for as the season advanced, and when the spring crops of Oats and Barley were to be planted, the land could not be worked properly, notwithstanding much labour and pains were bestowed upon it, the lent grain was consequently oftentimes a failure, or at best an indifferent crop, and so the scheme was after a time given up; mine was an experiment farm rather than an example, at least one to be followed. I did not, however, like to allow myself to be dead beaten; and finding the great advantage of having a few roots in winter for my stock, I changed my course of cropping, and managed the eight pieces of arable land I at that time farmed as follows, viz., a rotation of six years. First, fallow or Vetches manured, Wheat, Clover, Wheat, Beans, the land previously manured, and lastly, Oats—to be succeeded again by winter Vetches. On this rotation I have no cause to complain of my crops, which have been to the full as good as those of my neighbours.

The two remaining pieces situated near the homestead, and also being tolerably sound land, they having been pretty effectually drained, I reserved for roots alternately with white straw or corn crops. The roots I have always carted off at my convenience, choosing as dry a time as I could, and have stowed them away with various success as to their keeping sound. This plan I have now pursued for several years, and have found the roots so grown to be of considerable advantage to my winter stock of cattle. The quantity of land being small (not exceeding seven or eight acres in a season), I have been enabled to go on without difficulty. These two pieces I consider the most profitable of my whole farm, having always grown me excellent crops of roots and corn alternately, having never lain idle, or having required a naked fallow for upwards of 30 years. I have always kept them clean at a small expense, by forking out the little Couch the land produced at a cost not exceeding in any one year two shillings per acre. The ground is never ploughed more than once in preparation for the root crop, and in alternate years the succeeding corn crops are usually put in, the ground being worked with the scuffler without ploughing. The only difficulty I had to contend with was to get the land into fine tillage for the root crop by once ploughing. This I effected after the following manner. As soon as my winter Vetches were in and my Wheat sowing finished (which I always drilled on a stale furrow, and in many instances after the scuffler, without ploughing at all), I looked over the field intended for a root crop very carefully; forking out with a three-grained fork every blade of Couch that was visible. This, after the land had been once got into condition, was by no means either a troublesome or expensive job; never exceeding, as I before observed, 2*s*. per acre. The ground being thus prepared, at my earliest convenience, and having previously well opened out the old furrows in dry weather, I carted out on the land the usual dose of dung; and spreading the manure by carefully shaking out every lump, so as equally to cover the ground with it, I proceeded immediately to plough it into ridges of 6 feet in width, taking a deep furrow of at least 7 inches. The land thus ploughed remained to receive the benefit of the winter frost, to mellow and sweeten till the spring, at which time, when thoroughly dried, I passed, if found needful, a heavy roller lengthways and across the ridges; and then put the scuffler to work lengthways, with the broad shares, cutting the whole surface about 2 inches in depth, and thereby destroying a multitude of annual weeds which had sprung up since the land was ploughed. The dung ploughed in before winter remained undisturbed and well covered. Nothing now remained to be done till the time arrived for planting the Cabbages and the Beet Root, or for drilling the Swedes; at which time the scuffler was again put through the ground nearly to the full depth of the furrow, now pretty well mellowed, mixing the manure, and further pulverising the soil. By these means I have rarely failed to produce the requisite fine tilth; and have never been compelled to sow the Swedes twice. For should I apprehend danger of losing the plant from an attack of the fly, I have while the dew was on the young Turnip, dusted them with fresh slaked lime; this I have always found a complete safeguard. The roots have been carted off the land and stacked away, and the land immediately prepared and drilled with Wheat, generally with the scuffler alone, or it has got one furrow for some white straw crop, to be planted in the spring.

I have now told you all I know and have practised in the growth of root crops on my land, as grounded on my own actual experience, and shall now have to launch out into the region of fancy and untried experiment. No doubt you will say, why not let well alone; for if you do not you will again, in all probability, stick in the mire. Perhaps I may; I cannot, however, burn my fingers in this matter, and have sanguine hopes of better success than attended me when I commenced farming many years since. Circumstances are now in my favour, which were then against me. I imagine that I possess more knowledge and experience; the drainage of the heavy clays is now well understood; a greatly improved method of storing the root crop is practised; which (since we can by no means reckon upon feeding off the Turnips as they grow), is a necessary part of the business; and Mr. J. Morton, by means of accurate and well-tested experiments, has shown us that sheep can be fed in littered yards and under shelter, well and quickly, with less food than they would have consumed in the exposed and open field fold.

Now, gentlemen, matters standing thus, I confess that I am induced again to tempt my fate, and a second time to alter my course of cropping.

Arable land must, by management and by judicious husbandry, be rendered fit, not only to produce good corn, but also by the introduction of roots, where practicable, and by green crops, be made capable of carrying a large stock of cattle and sheep. I consider that system the best and most profitable where the land is made to produce alternately food for man and beasts; in other words, that two white straw crops should never be permitted to be planted in succession: this is the foundation and the groundwork of all good husbandry, and ought never to be departed from; it is the sole restraining covenant I would ever introduce into an agreement between landlord and tenant as to the cultivation of his arable land; for if this were strictly adhered to, the land and the landlord could never be materially injured by a tenant; and it might also be a means of removing a prejudice, at this time prevailing in the minds of most of the landlords in the vale of Gloucester, against converting worthless pasture into tillage land; which, if it were set about judiciously, would benefit the tenant, the landlord, and the country at large. I can show you two pieces of land which I myself broke up from pasture more than 30 years since; and which at that time produced me little or nothing, but which are now very valuable arable land; and as they have never been over driven, are at present more fitted for being returned to pasture, and are in better heart than when first ploughed up. But, gentlemen, you will say I have been running rather wide of the subject proposed, and I come back to tell you what I next propose doing, or endeavouring to do.

I must first observe that much of my land has been laid out in wide ridges of 8 yards, gathered twice from the flat, and drained where needful, with tiles and stones up every furrow; the remaining part of the farm is in lands of 6 feet or 2 yards wide, and has been drained many years since with shallow stone drains in a direction across the run of the furrows at intervals of 8 or 9 yards, and with tile heads. This method of draining does not answer upon our close and adhesive clay soils, as it does not carry off the surface water readily. It is my intention to set out these lands afresh, and to put them (as I have done the others) into ridges of 8 yards in width, and to intersect the old drains, where

necessary, by running others up the new furrows, at intervals of 16 or 32 yards. By this means I hope to give the old drains a quicker vent, and to enable them to discharge the water more readily than they do at present. Other drains may at a future period be laid in those furrows which are at first missed, whenever it may appear necessary. We will now suppose the ground drained and rendered as sound and dry as such land can be made. We will also suppose the land to be in fair condition and tolerably free from Couch and root weeds (for should the field have been run out, as we say, and full of Couch, a naked fallow on this kind of soil must of course be resorted to). My mode of proceeding will be thus; I shall in the first place have the ground very carefully looked over, and with three-grained forks dig up every blade of Couch and every Dock that can be seen; having previously finished, as I said on a former occasion, sowing my winter Vetches and drilled my Wheat. The land intended for a root crop is then to be ploughed, in a direction diagonally to the run of the furrows, into single bouts of 27 or 28 inches; or into two bout ridges where Cabbages are intended to be grown. The appearance of the field will then be like garden ground laid up in trenches. I should plough as deep a furrow as practicable, exposing a large surface for the winter frosts to mellow and sweeten. After the land has become sufficiently pulverised and the trenches are in a dry state, with a double mould-board plough, I purpose thoroughly to open out and considerably deepen them, directly following with a stout plough, having the turn-furrow taken off, and with a strong team of horses harnessed at length, subsoil or stir the hitherto unmoved soil in the bottom of every furrow trench, as deeply as may be practicable—6 or 8 inches at the least. This being not trampled on while in a moist and tender state, will lie light and hollow for the air and frost to sweeten and pulverise. Nothing will have to be done now to the land till the dry weather sets in in the early spring, be it in February or the beginning of March; at which time I intend to set the dung carts to work, and having spread the manure carefully in the bottom of the trenches, with a pair of horses driven abreast, cover it up, by splitting or reversing the bout ridges. These are again to remain untouched till well dried and pulverised, when an opportunity will be afforded of subsoiling or stirring the intervals. Thus then nearly the whole of the ground will have been loosened to the depth of 12 inches at the least, and a sufficient tilth gained, and that too at no very ruinous expense. I prefer to cultivate my Turnips and other roots (such as Cabbage and Beet) on the ridge system after the Scotch manner, because it will give me an opportunity of working the ground deeply and frequently, during the growth of the crop; and because it will allow me, at the time of singling out the Turnips, to draw the earth well away from the plants, whereby they appear to swell, and form better bulbs. I am now working a piece of 7 acres in this way for roots, and shall be happy to show what I am about, to any of the members who may feel disposed, or who may think it worth their while to pay me a visit.

It is somewhat remarkable that in the autumn of last year, I was suggesting the mode which I have now adopted of preparing my land for roots, by trenching and subsoiling, to one of our members, when he observed to me that he had met with the same idea or something similar to it, in a Gloucester Journal of November last. That member has sent me a copy of the paper, which I have now lying before me. I completely agree with the writer in principle, but not exactly in his practice. In the first place, I do not well understand how land can be ploughed into single bout ridges with a wheel plough, and I consider a swing plough with two horses abreast far better calculated for the operation. I would likewise confine the trench ploughing and subsoiling to the fields under preparation for the root crop; as I well know by practical experience, that a surface which has been exposed to the action of the weather through the winter should by no means be ploughed down, but should alone be worked by the scuffler and harrows in putting in the lent grain. Strong heavy clays, such as I am farming, should be carefully and deeply ploughed before winter; this will enable the farmer (provided his land has been properly drained) to get through the necessary work in a way that would surprise any one who has never given the plan a trial. Our calcareous clays by exposure are rendered so friable that in spring they can be worked quite as readily as the lighter soils; but turn up the stiff and clung bottom after winter, and you will never recover that you have lost—namely a fine workable surface; but instead you will be plagued with clods as hard as brickbats, which you may beat and hammer to all eternity without producing the desired effect, and that too at a vast expense. I am happy to find that some of my neighbours are at length beginning to open their eyes and are following the lead I have given them.

Having thus stated to you in the best manner I am able my opinion of the practicability of raising root crops upon heavy soils, with profit and advantage to the grower, it only remains for me to declare to you to what extent I would propose their culture. I have now before me a paper, sent me by a friend out of the county of Nottingham, wherein Mr. Richard Parkinson, an eminent practical farmer of that county, has stated that on a clay farm, he has for many years past pursued a course of cropping on a rotation of 12 or twice six years. I consider that his authority may be relied upon, and would follow in his track. I myself am holding 12 pieces of arable land which I would crop nearly after Mr. Parkinson's manner:—

1. Cabbages, Carrots, Mangold Wurzel, manured with dung.
2. Oats or Wheat.
3. Seeds (White Clover and Ray Grass).
4. Ditto (red and ditto).
5. Wheat or Oats.
6. Winter Tares.
7. Swedes, manured with dung and bone-dust.
8. Wheat or Barley.
9. Clover or cow Grass.
10. Wheat.
11. Beans or Peas, dunged.
12. Wheat.

Thus one-sixth part of the whole arable land would be under a root crop. I have little doubt of the practicability of this rotation provided the land is furrow-drained as it ought to be, and the ground thoroughly cultivated, and subsoiled on the plan I have proposed. I will now leave the subject in your hands. The cultivation of root crops on such soils as those I am farming, has been little practised and less understood, but is a matter well worthy your serious attention. I would by no means advise you to attempt it till such time as your land has been properly furrow drained. And observe that your roots and Turnips must be planted early, so that they be ripe and ready for stacking away before the bad or wet season sets in in the autumn; for you must not attempt to feed them off where they grow, or you will be, as I was some years since, set fast in the mire; and from which I feel assured you will not get out without serious loss—*Mr. N., in the 4th Report of the Gloucester Farmers' Club.*

* Dressed with lime previous to Wheat, or a light dose of compost.

Home Correspondence.

Soap as a Manure.—Having seen in some late Number of your excellent Paper some discussion on the value of soap as a manure, I am inclined to give you my experience in this matter. I am a silk dyer, and use about 15 cwt. of soap weekly to discharge the gum and oily matter from the silk before dyeing. I also use about 1 cwt. of soda to 3 cwt. of soap, which I presume unites with the oily matter of the silk, forming a species of soap. The result is, that I produce from 4000 to 6000 gallons of strong soap suds per week; and, having a small farm, I have latterly applied the whole of this to my land, and its effect is most extraordinary. My experience in its use has been only one season, and I cannot, therefore, give any comparative results; but I consider it more powerful than any manure that I am acquainted with. If any of your readers will do me the honour to come and see my land next spring, when vegetation begins to move, they will have ample evidence of the value of soap as a manure; and if farmers were allowed the drawback of the duty on soap used as a manure, in the same way that us manufacturers are allowed it by the government, there is no doubt in my mind that soap would soon supersede the use of guano. P.S. There is a very large consumption of soap by the manufacturers of cloth, linen, silk, and cotton goods, and the duty is remitted to such consumers; the farmer has surely an equal claim, as he is the manufacturer of food, and they of raiment. The soap which I use on my land is duty free, because I employ it first as a manufacturer.—*Thomas Dalton, Coventry, Dec.* 10.

Management of Liquid Manure.—The principle of the apparatus is a very ingenious one, by which your correspondent, Mr. Liddell, of Hull, proposes to solve your mechanical problem respecting the drainage of a fold yard, but in a part of the practical details, his invention appears to me susceptible of improvement, which I proceed to point out. Your correspondent makes his float (which is the regulator of the apparatus) to rest on the fluid in the manure-tank, and consequently the degree of its efficiency is entirely dependent on the varying height of the fluid contained therein. One or other of the following results must flow from this arrangement: 1st. Either a constant and harassing attention must be given to adjusting or regulating the float on its stem, which destroys its character as a self-acting instrument; or 2d, if this be not done, and the fluid get low in the tank, it is liable to be inundated with rain-water before the float is in a condition to act upon the stopper or valve. When the rain-water and fluid manure combined have risen to such a height in the tank as to cause the valve to be closed, the latter must remain in that situation until some of the fluid has been abstracted from the tank, or a new adjustment made, and unless one or other of these conditions be complied with, the liquid manure will be detained in the drain, and compelled to flow over into the waste pipe. A sufficient remedy for all these inconveniences will be found by making the float to rest upon fluid contained in a separate well of small dimensions, with a graduated and narrow outlet, ample enough to allow whatever manure may enter the drains to flow off into the manure-tank without materially affecting the float, but also small enough to make it quickly sensible to any unusual addition from an influx of rain-water. In an accompanying drawing I have represented this well, communicating on the one side with the drain from the fold-yard, and on the opposite side by a contracted outlet with the drain leading to the manure-tank, capable of being still further contracted by means of a sliding plate, which is fixed to the float by a projecting arm, and moves up and down loosely, and without friction, in raised grooves, formed parallel with the sides of the outlet or aperture. In the ordinary state of the apparatus, when liquid manure only is flowing into the tank, the upper edge of this plate is on a line with the bottom of the outlet: but when a fall of rain brings into the well a greater quantity of fluid than can flow off by the outlet in the same time, the float will begin to rise, and with it the plate, which will thus assist in restricting the efflux of water from the well, and ensure the speedier action of the valve. It will be seen, then, that the apparatus, when once properly adjusted, is strictly self-acting, without requiring human care and attendance. In dry weather it will remain nearly stationary, with the valve open; but during rain the instrument will be under the influence of successive alternate movements, minute in degree, and regular in time. The influx of rain-water first raises the float and closes the valve, and, accumulating in the drain, flows over into the waste pipe. In the meantime, however, fluid is also escaping from the well, which lowers its level, the float begins to descend, and the valve is slightly raised, and a fresh influx of water again closes it, and thus it goes on as long as the rain continues.—*J. H. H., B—k.* [This is, in effect, an apparatus for regulating the rate at which water shall enter the tank. Supposing the machine able to deliver into the tank one gallon per minute, and rain to pour on the yard equal to 10 gallons per minute, then every minute, *from the very commencement of the shower*, one gallon will be saved and 9 wasted. But we do not want this: we want the whole of the first hour of the rain to run into the tank, because all this is a strongish decoction of the soluble matter in the yard, and, after the first hour, on the assumption that by that time the decoction is so weak, owing to previous washings, that it is not worth keeping to cart on the land, we want the whole of it to run to waste.]

Cabbages, Potatoes, &c.—I am surprised to see so little agricultural matter from Devon or Cornwall, two counties of large extent, and from their situation and state of cultivation well able to contribute the results of good farming. The lack of time, not of inclination, has hitherto prevented me from sending you any little information. I now send an account of some extraordinary Cabbages; there is no doubt of its correctness. "A few days since a wager was decided respecting the weight of some Cabbages grown at Saltash, which speaks well for the cultivation of vegetables in that place. Bets had been laid that six Cabbages could not be produced by any grower in Saltash that would weigh 300 lbs. The requisite number were exhibited last week; they were of the Flat-pole kind, and cut from a field belonging to Mr. William Toms, of the New Inn, Saltash, their total weight being 337 lbs.—viz., 61, 53, 57, 56, 54, 56—337 lbs. when cut; but in taking them to St. Budeaux they lost 5½ lbs., from some of the leaves being knocked off, and the moisture evaporating from them."—(Taken from the *Devonport Telegraph*, Saturday, Nov. 15, 1845.) In the same paper an account is given of a Carrot, drawn in St. Budeaux, 13 inches in girth; and a Turnip 3 feet 3 inches ditto. The Flat-pole Cabbage is the same as the Scotch Drumhead kind; the parish of St. Budeaux, and a small tithing adjoining, named Western Peverell, have long been famed for growing this sort, which is chiefly used for milch cows. Mr. W. Toms, the grower, is a native, I believe, of St. Budeaux, and has lately emigrated to Saltash. I expect he took the art of growing Cabbages of this size with him. I suppose, also, they were grown at a considerable distance apart; but even if the interval were 8 ft., a very large produce would be derived per acre. The strange disease of the Potato in this neighbourhood as quoted in your Paper. It exists almost generally throughout the country, with some exceptions, however, worth remarking. I grow something about an acre, mostly for the family use and for pigs. I planted about 20 land yards with a kind called Gilliflowers, on a dry substratum of slate rock; the ground has for the last 10 years been occupied with forest-trees of various kinds, and I have never applied any manure to them. This last spring the ground was cleared and planted with the above kind, no manure, the result, all good. Again, a small space was planted with Early Frames, the same culture, all good. A large portion of my crop was planted on a subsoil of loam, kind of clay, well manured with dung, and well limed on the top; those of a kind named Spanish Lords were nearly all good; but of the two kinds, Red Lords and Red Ladies, the two prevalent kinds here, one-half were useless; but it should be remarked that where the lime was laid in greatest quantity, the crop is less injured.—*J. B., 5 miles north-west of Plymouth.*

Seed Wheat.—Monsieur Girardin communicated to the French Academy, on the 24th of November the result of some new experiments on the best method of preparing seed-wheat with a view to prevent Smut. It has sometimes been supposed that the principal benefit arises from the skimming off of the light grains, and that it is quite a matter of indifference what the liquor is so long as it be of sufficient specific gravity to make all diseased grains floating. Monsieur Girardin, however, is decidedly against the practice of sowing without the previous use of some chemical substance. He recommends, after many experiments, the method of Monsieur Matthieu de Dombasle, in preference to all others, as simple, economical, free from hazard to the labourers and the public, and yielding the soundest and most productive crops. Since arsenic, blue vitriol, verdigris, and other poisonous substances may be advantageously replaced by sulphate of soda and lime, he recommends the adoption by Government of measures for the prevention of the old dangerous mode of steeping. The method so highly and even exclusively recommended by M. Girardin, is described in Philippar's useful Treatise on the Diseases of Corn, from whence the following is extracted:—Sulphate of soda (Glauber's salts) is dissolved in water in the proportion of 2½ lbs.

to 31 gallons of water * With this solution the Wheat laid upon a paved or slabbed floor is sprinkled, the whole being meanwhile well turned till the grain will absorb no more of the liquid. Twelve pounds and a half of sifted quicklime are then added to each quarter of corn, taking care to mix the seed as carefully as possible. The seed thus prepared should be sown immediately. The sulphate of soda, which is composed of sulphuric acid and soda, combines with the lime; the lime forms sulphate of lime or gypsum; the caustic alkali acts on the diseased germs, and the calcareous salt stimulates the corn. A very simple mode is adopted occasionally in this neighbourhood with perfect success. A large shovelful of sifted quicklime, the fresher from the kiln the better, is mixed with a bucketfull of boiling water. This is poured on 4 bushels of Wheat, the whole being intimately mixed. Each 4 bushels of Wheat is treated separately, and then the whole quantity formed into one heap. The Wheat should be sown, if possible, the next day. This plan has stood the test of above 30 years. — *M. J. B., King's Cliffe.*

Tropical Agriculture.—Though beyond your present sphere of action, you will be glad to hear that the West India planters are becoming more alive to the necessity of scientific culture. You will see that we labour under great difficulties in acquiring the principles of agriculture, because they must be culled from works bearing expressly upon agricultural systems of a very dissimilar character, and, therefore, requiring to a certain extent different means, though, no doubt, based in reality upon the same principles. Thus, in this country, drains, for the most part, are introduced to carry off superfluous water. In the West Indies they should be introduced in order to give access to a store of moisture, whilst in both cases the introduction of air is equally important. Now, to get at these general principles, you will see what more time and labour is required than can well be expected in men exposed for many hours each day to a tropical sun, and you feel, I know, that to advise in such matters requires a particular train of thought and knowledge of local particulars. I gather this from the answers which you have given at different times to the questions I have taken the liberty to put to you. I hope, however, to see the day when colonial planters may peruse your valuable pages with increased advantage, owing to their increased acquaintance with general principles. With respect to the answer to my inquiry as to the best green crop for the West Indies, which appeared in a late *Gazette*, you will, no doubt, perceive that it is unsatisfactory in many points. The writer did not probably see the drift of my question, which was to elicit from you some information, not based upon the practice of the colonies, but upon general principles, and an acquaintance with districts liable to suffer from drought in this or continental countries. Doubtless the cane tops are invaluable food for the cattle, and so are the sprouts of the cane, and the corn-blades mentioned; but, except as regards the cane-tops, which we must have, and therefore should use to the best advantage, such food is rather to be looked upon as a *dernier resort*, than a link in scientific agriculture, because they exhaust the land, which, with very care, can hardly pay the expenses of cultivation. The corn plant, for instance, requires the silicates, and other ingredients of the cane. I apprehend that on many accounts tuberous roots should be cultivated expressly as food for our cattle, and the question is, which would make the best return? I fancy Mangold Wurzel; but I am not competent to say positively. Turnips, I fear, would not answer; Lucerne is, no doubt, good. I hope by the spring to be able to speak with more confidence.—*P. Lovell Phillips, M.D.*

Potato Disease.—Allow me to remark that you may with great propriety suggest to your readers, who are growers of the Swedish Turnips, that each should stack a few tons—say 10 or 20—and thus have the opportunity of rendering their poor neighbours a great service in case of need in the spring, and this without loss to themselves. 20*s.* a ton will pay the grower very well—certainly a moderate price for the consumer to pay. I believe I am correct in saying the crop of Swedes this year is good, as well as hay, so that almost every grower can spare the quantity I mention, which, together, would amount to a great weight.—*Invalid.*

Manure.—F. Marston (page 777) complains that his manure when ploughed into the ground was washed away by heavy rains, and was seen issuing from the drain in a dark stream; and he infers, somewhat strangely, from this, that "Oxygen" is wrong in his view of the affinity of soils for the fertilising salts of manure. The principle maintained by "Oxygen" is, that exposure to rain is necessary to effect that kind of decomposition, oxidation, by which the union of the soil and salts is insured. Had F. Marston put his dressing upon the land, and not into it, the drains would not have washed it away. Much as I have been interested in "Oxygen's" communications, I should be a stronger convert to his theory if he would bring some chemical experiments to support it, or would adduce some analogous facts from nature in support of his views, which, though highly plausible and apparently sound, require more elucidation from science than he has yet given. I quite agree with your remarks on this subject in one of your preceding Numbers, and I hope he will supply the deficiency.—*Lapis.*

* The figures in Phillippar's book are 80 grammes to the litre of water, 8 kilogrammes to the hectolitre of seed. This gives 50 pounds of sulphate of soda to a quarter of Wheat, which is evidently wrong.

House Feeding.—Though deeply interested in the welfare of the agriculture of my country, and fond, or foolish enough to believe that it is able to compete with any competition that can be brought against it, I am only about to put my theory to the test, by engaging an arable farm of middling quality at its present rental, with every prospect of open ports on an early year of my occupancy. I am a grazier of some years' standing, but as the land is of excellent quality this is not considered a fair test. My farm is about 112 acres, divided into 14 fields of nearly 8 acres each, at present all in pasture, except two meadows and two fields of sown Grass. It is my intention to break up 10 fields —half at present for green crop, and half in spring for Oats—bringing them into operation for a five-course rotation. I purpose keeping as large a stock of dairy cows as possible, and had decided on house feeding them as much as practicable, of the advantage of which practice, if the expense were incurred, I had no doubt; but recent communications to your Paper throw considerable doubts on the question. One in last week's Paper (p. 792) states, the quantity of milk was reduced one-half after the cows were eight days in the stalls. I suspect, in this case, the Grass was too old; but the question is so important, and bears so directly against my theory, I shall be extremely obliged if you will favour me with information on the subject. The Potato pits have been examined by our farmers, and I am grieved to say that those which were stored as good, a month ago, are turning out in most cases masses of rottenness. Picked ones are sent to market at present in great abundance, but what the price will be after Christmas is difficult to guess.—*A Subscriber, Whitehaven.* [We have not much experience of stall-feeding cows, and shall be obliged for statements of that of our readers. What experience we have is certainly opposed to the paragraph in p. 792. The glass milk-pan is, we believe, a very excellent one, and now that glass is so much cheaper, good ones—well annealed ones—may, doubtless, be had at reasonable prices. See p. 267, 1844.]

Turkeys and Potatoes. — Having several young turkeys (hatched last July) lately mope about for a few days and die, I should be glad to learn from some kind correspondent if the partly decayed Potatoes, so common this season, could be the cause, or what? though we have very few yet the turkeys might have got at some. I opened their bodies to discover the cause of death, found the entrails quite inflamed, and to all appearance no food could have passed for several days. I administered castor oil, onions, pepper, &c., without effect. Indeed I fear my doctoring hastened the death of the birds.—*Turkeycock.*

Rooks and Insects.—I see the Turnip is much infested by insects in Scotland. Now, very lately they have killed all their rooks in most parts of the country. Do not you think many wish them back again? There ought to be a severe law against shooting swallows, brown owls, and other birds, whose labours are solely directed towards relieving us of animal pests, and not against shooting corn eaters as the law is at present.—*Ornithophilus, Merioneth, North Wales.*

Dairy.—Among the agricultural queries in a late Number of the *Gazette*, is one from "a Subscriber," who complains that his dairy is overheated in summer, and seeks a protection from outside the roof. I beg leave to suggest to your querist that a protection inside his roof would be effectual and more lasting. His roof, he says, is slated, if it is only "rendered" with mortar against the slates, if he will have thin boards nailed against the rafters beginning at the wall-plate, and stuff the space from the board to the slates with straw, fern, or moss, he will have a non-conducting medium which will intercept both the heat of the summer's sun and the cold of winter's frost; if his dairy be already hollow-ceiled, and the envelope of air in the hollow ceiling from its facility of being heated proves still to be an insufficient non-conducting medium, let him put "risers" on his rafters, and a casing of thin boarding to hold a bedding of straw or other material, as above recommended. If the boarding be whitewashed with a good coat of lime-whitening, the sheeting of boards will be less ready to catch fire; but this precaution is scarcely required in a dairy. Our cabins in Ireland, when well built and roomy, are very economical structures for retaining heat, a most important matter in our humid climate, but many of the slated cabins have their walls so thin and their roofs so stingily slated that the poor are often, as Miss Edgeworth says, "kilt with the cough and kilt dead with the rheumatism," but still worse, some of these slated "bird-cages" are not hollow-ceiled, and "rendering" is a poor protection against the "winter's flaw;" whatever little heat the scanty fire below emits, instead of doing the part of an Arnott's stove, and drying and warming the whole house, it is carried off through the leaky slates, and the comfort of even the old and much-abused mud cabin is not secured to the inhabitants; but I do not hereby recommend the dirty and decaying straw roof for the outsides of residences or dairies, I only say that comfort ought to accompany taste in the residences of the poor. With respect to dairies, however, the straw inside-roof is an equaliser of temperature and may be found useful. I would say to your subscriber that this suggestion has had but one experiment to support it, but it seems in theory at least feasible. — *Rd. Dowden, Rathlee, Sunday's-Well, Cork.*

Dairy.—Your correspondent, "A Subscriber" (see p. 762, col. *c*), will find a covering made of straw, or Reed, according to the inclosed pattern, will answer his purpose. (I have also found this kind of covering excellent for frames, &c., in winter.) Milk will turn sour from various causes; an ill-constructed dairy, want of ventilation, allowing the milk to stand too long before skimming, and last, not least, a neglect of scalding the utensils. Your correspondent should also bear in mind that when once the milk is suffered to turn sour, the dairy will not be sweet again for several months, unless every article in the dairy is thoroughly scalded, and in some instances it will be found requisite to whitewash the walls and scald the floor also. The best dairies are those that have the floor about 2 feet below the surface, so that the benches for the milk-pans stand nearly level with the soil on the outside of the dairy.—*W. P.* [The pattern sent was about the thickness of three straws, and consisted of straws combed out and placed parallelly and tied and platted together in threes by means of string. Another correspondent says, "I recommend your correspondent to paint the slates of his dairy-roof white and he will find them cool on the hottest day."]

Salt as Food.—It is to be regretted that there are so many opposite opinions entertained by parties on agricultural subjects. It is in consequence of such a difference of opinion existing on the use of salt in the feeding of stock that I am induced to trouble you at present. In No. 2 of the "Journal of Agriculture" for Scotland, page 136, Mr. James Ol. Fennell, writes unequivocally in favour of the use of salt in feeding, and quotes from a host of authors in support of his statement, of which those that are most to the point, I beg to offer to your notice, viz., Matthew Aphonin, a Russian naturalist, remarks that "Oxen fatten very quickly upon the sea coasts where the Arrowgrass (Triglochin maritimum), their favourite food abounds;" "and if this be so," adds Mr. Fennell, "it is probably ascribable to the saline nature of the plant, and to the sea breezes containing particles of salt, which appear necessary to stimulate their digestive organs, and therefore conducive to their health." Dickson, in his "Husbandry of the Ancients," tells us they were accustomed to prepare the straw for feeding stock, by keeping it for a considerable time steeped in brine; that it was then dried, rolled up in bundles, and given to oxen instead of hay. Dr. Brownrigg, in his "Art of Making common Salt" (1748), remarks that "Black cattle and sheep take a pleasure in licking it (salt), and by it are preserved from many diseases; they also thrive to admiration upon it." Sir John Sinclair tells us that a Mr. Bracebridge, "drenched some rotten sheep night and morning with strong brine, after which he did not lose one; they became fat, and the meat was fine and good, as if the animals had never been affected." Mr. Fennell also states that, "the fattening property of our own salt marshes is well known to graziers and farmers." As I think I have now shown that there is a notion that the use of salt is favourable to fattening, I proceed now to inform you that it is also said that "in fattening salt must be avoided." In No. 5, page 473 of the Journal already named, we find an admirable article on "Animal Life," by that talented advocate of "Shelter," Mr. Donald Bain, of Edinburgh. The following quotation he gives from Liebig's "Animal Chemistry:" — "The presence of free muriatic acid in the stomach, and that of soda in the blood, prove, beyond all doubt, the necessity of common salt for the organic processes; but the quantities of soda required by animals of different classes to support the vital processes are singularly unequal. Again, it cannot be accidental that the life, the development of a plant, is dependant on the presence of the alkalies which it extracts from the soil. This plant serves as food to an extensive class of animals, and in these animals the vital process again is most closely connected with the presence of these alkalies. We find the alkalies in the bile, and their presence in the animal body is the indispensable condition for producing the first food of the young animals; for without an abundant supply of potash, the production of milk becomes impossible." "Alkalies," adds Mr. Bain, "are useful to general health therefore, and indispensable to giving milk. But in fattening, salt must be avoided;" "for it is worthy of observation," says Professor Liebig, "in reference to the production of fat, that the absence of common salt (a compound of sodium which furnishes soda to the animal organism), is favourable to the formation of fat; and that the fattening of an animal is rendered impossible when we add to its food an excess of salt, although short of the quantity required to produce a purgative effect." Mr. Bain now goes on to state that "It is possible that this may account for the fact that the Islands of Guernsey, Jersey, Alderney, and the British Islands generally, being loaded with spray from the sea, their cows are excellent milkers, while the beef of all their cattle is, I believe, indifferent. Our Scottish feeders have at once found out that Grass too much impregnated with salt does not feed, and they have rejected it accordingly. May it not, however, be useful in producing milk?" I trust I have laid the matter properly before you, and now wait the result; but before leaving the subject, I might inquire, seeing that all agree that salt is favourable to health, is fattening a healthy process?—*Young Scotland.*

Salting Pork.—(See p. 777, the Curing of Pork, by "D. M.") Some of your subscribers would be obliged by your correspondent "D. M." stating the reasons why he recommends curing the pork while it is hot; also, why he uses hot water when he desires to increase the quantity of brine; the general practice being that meat should remain till it is cold before it is cut up, and that brine should not be used till it is cold. It would also be desirable to know the weight of the meat, of the sugar, and the salt. If brine is used made of sugar

and salt, the quantity of each, and the specific gravity of the best made brine.—*An Old Subscriber.*

Top-dressing.—The Rev. Mr. Lowder enquires in the last No. of the *Agricultural Gazette* if land, which he purposes to sow with Carrots and Oats in the spring, may be top dressed during the present month instead of the manure being dug or ploughed in before sowing. The land having been well cleared and dug to the depth of 10 inches, after clearing away the Potato crop, there cannot be any doubt of success attending his proposed plan of laying on the manure now, and leaving it to the oxidizing influence of the air and rain. The ground, by the time the seed is put into it in the spring, will be in the best possible state of preparation to receive it. The writer of this has this season some ground preparing in the same way for Turnips. It was forked last month to the depth of 13 inches, and the manure laid on for exposure to the weather during the winter. Over the manure is strewed a mixture of chalk and salt in equal parts, in the proportion of 2¼ cwt. of each to an acre. The chalk and salt had been well mixed and kept for four months before being used, in order to effect a double decomposition by which two soluble salts are formed, muriate of lime and carbonate of soda—both good fertilizing salts, and as effective for Carrots as for Turnips. In using manure for autumn top-dressing, care should have been taken to make it as rich as possible, by mixing with it plenty of liquid manure, especially human if it can be obtained; and the dressing cannot be used too fresh. If left to become very putrid, as is commonly done, the best parts of the manure fly off in the form of ammoniacal gases; and I am inclined to think, from what I have observed of the comparative effects of fresh and putrid manures, that they act on different parts of a plant. Putrid manure makes the green part of Turnips, Carrots, &c., very luxuriant, while the bulb does not grow in proportion. Fresh manure, on the contrary, if left to oxidize on the surface during the winter encourages the growth of the bulb, and makes the plant less inclined to run to leaf. A friend of the writer's took possession of a few acres of pasture on a slope, facing the south; the soil, gravelly loam on chalk. The herbage had been for many years so bad, that he was told by his neighbours that it never had and never would produce a good crop of hay. It had been manured sometimes with common farm-yard dung. The first year he cut a ton and a half of hay per acre, and had as good after feed as any in the parish. The plan he adopted was that which the writer of this advocates; namely, preventing the manure becoming putrid, by taking care that the droppings of the animals (horses and oxen) were spread about at least twice a day. The land so treated during the last autumn and winter is now as rich in good herbage as any in the parish; whereas the former practice of manuring with well rotted dung had only produced a rank grass, not relished by stock, and unfit for hay. Will Mr. Lowder be kind enough to let us know the result of his trial, and oblige, among others—*Oxygen.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Dec. 9th.—The first Annual Lecture was delivered this evening in the theatre of the Royal Institution, by Dr. Lyon Playfair. The subject was the present distemper in the Potato. The lecturer commenced by making some general remarks on the history of the Potato, and its cultivation in this and the other countries of Europe. He also exhibited diagrams of the structure of the Potato, and tables of the chemical composition of the tuber in its healthy state. He then described the nature of the changes which took place in the Potato under the influence of the disease. Much had been said and written with regard to the source of the disease, and since minute fungi were frequently found present in the decayed Potato, the disease had been attributed to them as a cause. Some Potatoes, Apples, and other things had been inoculated with the sporules of the fungus, and these had become diseased. But if there were not some previous disease in the Potato, how was it that some Potatoes escaped whilst others were attacked? The disease, he believed, arose from physical or chemical causes. It was simply a decay of the tissue of the Potato, arising from the union of the tissues of the Potato with the oxygen of the atmosphere. When a decayed Potato was examined, it was found that the diseased spots were always found in the region of the tissue called spiral vessels, whose function it was to carry air into the tissue of the Potato. The reason why the cells entered into this decomposition so rapidly arose from a constitutional weakness on the part of the cells of the tuber. This decay is rapidly spread from one cell to another, and the looser the tissue the more rapid the decay. By grating the tissue of some sound Potatoes, and exposing it to the atmosphere of the lecture-room, it speedily assumed the colour of the diseased Potato. The cause of the constitutional weakness in the cells of the tuber was undoubtedly to be looked for in the weather. A peculiar weather had been observed over the whole of the north of Europe, where the disease had been observed, as well as in America. The disease was no new things and appeared always when such weather occurred. At the time the plant commenced growing, there was very warm and mild weather, and this was followed by cold and wet weather. The consequence was, the cellular tissue of the tuber contained more water than usual. In previous years an analysis of the Potato gave on an average 72 per cent. of water, but analyses which he had made this year of healthy Potatoes, gave from 72 to 75 per cent. of water, whilst the analyses of diseased Potatoes gave as much as 80 per cent. of water. Other plants contained the same increase of water constituents, as Turnips, and Turnips were also affected with the same disease. Turnips were not affected so generally as Potatoes, on account of their nitrogenous principles not being soluble as those of the Potato were. The disease then was a "consumption" of the Potato, arising from the decay of its particles in combination with the oxygen of the atmosphere, produced by the state of the cellular tissue, brought on by the weather. It arises from no degeneracy in the Potato, and it need only to be feared from a repetition of the same circumstances. In the storing and preserving the Potato one great fact should be borne in mind, and that is that the decaying particles were capable of communicating the decay to the sound tissue. Care then should be taken that they be freely ventilated, that they are kept dry and cool, and that there is absence of contact of the Potatoes. He defended the directions given by the Irish Commissioners for the storing and preserving the Potatoes as those best adapted for obtaining the object in view in the community to which those directions were addressed. At the conclusion of the lecture a vote of thanks to the lecturer was proposed by the Duke of Richmond, and seconded by P. Pusey, Esq.

Dec. 10th.—Lord Portman in the Chair. Dr. Playfair commenced by stating that the object of the lecture this evening would be to point out the mode of treating the Potato for the future, and first with regard to planting. He recommended that the Potato should be planted *immediately* for several reasons. 1st. Because there might be little left for seed in the spring. 2d. Because Potatoes planted now might be ready for use at the latter end of May or the beginning of June. Where economy of seed was not necessary, he thought it would be better to plant the whole tuber of the Potato than to cut it. Where economy of seed was necessary, single buds or "eyes" of the Potato might be removed and planted, the rest of the tuber being used as food. With regard to diseased Potatoes, he recommended that they should not be used for seed where sound ones could be obtained, but where these could not be got, then he advised the planting diseased Potatoes rather than none at all. There was no prospect of obtaining sound Potatoes from abroad for seed, and he had the permission of the late government authorities for stating that this was the result of their consular returns. If he were right in his views with regard to the nature of the disease in the Potato, then no evil could arise from planting Potatoes in the same soil in which they had become diseased. The fungus theorists objected to planting Potatoes in the same soil, but he had shewn their theory to have no foundation in facts. He would now consider how the bad Potatoes might be used, and quoted Boujean's experiments, to shew that no injurious effect was produced on the system by eating them cooked; they might when boiled be safely given to animals, which would thrive on them. He described the various processes of procuring the starch which had been brought before the public, and pointed out the fact, that in procuring the starch only one of the alimentary secretions of the Potato was obtained, that which assisted in keeping up the animal heat. The nitrogenous portion is thus lost. The plan he recommended by which these last might be saved to a great extent, was to grate the Potato, and pour water upon it till no more soluble matter was taken up, the remaining insoluble substance should then be dried, when it would be found an excellent meal, with which to make soups, puddings, bread, and other articles of food. He did not apprehend a scarcity of food, but he wished to point out the fact that Potatoes contained a very small proportion of nutritious or nitrogenised matter, and as this was the most important constituent of a working man's diet, he had drawn up a table of the comparative expense at which various articles of food might be obtained which contained one pound of this nitrogenous matter:

lbs.	*Substance.*	Price—*s.*	*d.*
25	of Milk contains 1 lb. of protein	3	1
100	Turnips	2	9
50	Potatoes	2	1
50	Carrots	2	1
4	Flesh	2	2
9	Oatmeal	1	1
7½	Barley-meal..	1	2
7½	Bread	1	2
7½	Flour	1	2
3½	Peas	0	7
3½	Beans	0	6½

He drew attention to the importance of cultivating the Leguminosæ with such plants as the Potato, on account of the large quantity of nitrogen they contain. In conclusion, he hoped the present blight would direct attention to Potatoes as an article of diet, and lead to a much less extensive dependence on them as food, a dependence of which they were unworthy, and in the end, this dreaded visitation might prove a national blessing.

SMITHFIELD CATTLE SHOW.

The Cattle Show of the Smithfield Club is best described this year by the epithet respectable. If we missed some of those astonishing mountains of tallow, which have graced former exhibitions, the level character of the show, and the close approximation of the unsuccessful bovine, ovine, and porcine candidates to their more fortunate brethren who carried off the prizes, or who exulted in the judges' "commendation," demonstrates the extent to which the improved breeds of cattle are diffused. Every animal in the yard was fattened beyond the point which is desirable for the stomach of the consumer, or conducive of profit to the feeder, and the expenditure of food employed in bringing them to that state can only have been incurred to prove a fact which is now questioned by none, namely, the aptitude of the improved breeds of British cattle to fatten at an early age. In one or two instances the weight of the different descriptions of food consumed was stated on the placards exhibited above the animal, and we would respectfully suggest to the ruling powers of the Smithfield Club that by requiring such a statement from every exhibitor, they would add much to the practical utility of the exhibition, accumulate data for scientific agriculture, and establish the best criterion for testing the economical value of the different breeds, and of different descriptions of food. Instead of being merely lost, as now, in vague astonishment that a beast supplied *ad libitum* with the food prescribed to the different classes should attain such an enormous size, we should be furnished with means for estimating correctly the cost of producing a pound of beef and mutton, and of deciding whether they can be obtained respectively from Devons, Herefords, or Short-Horns—from Downs or Leicesters, with Turnips alone, with cake, with linseed, or corn, at the cheapest rate. Economy, meaning thereby not close-fistedness, but a judicious economy must henceforth be the order of the day with farmers, and the practice which is the most profitable will prevail. This, however, can only be ascertained by bringing the feeding department in common with all operations of agriculture to the test of weight and measure.

The candidates—we have hitherto applied the term to the animals; we now use it for their owners—exhibited the usual array of noble and illustrious breeders and feeders, with Prince Albert at their head, and though the aristocratic competitors received a fair share of the prizes, the subjoined list proves that in making their award, the judges paid more respect to the merits of the animal than the title of his owner. When princes and peers enter the lists as competitors at agricultural shows, they must feel more satisfaction in winning a prize, from knowing that they deserve it, and that it was won on an arena where the *yeoman's* toe doth sometimes gibe the courtier's heel, than they would derive from their degree if they were entitled, as at Oxford, to claim it without an examination.

The exhibition of implements and roots, though no part of the Show as regards the Club, and a work of supererogation on the part of the seedsmen and implement-makers, is by no means the least important feature of it. With respect to the roots, Gibbs and Co. seem to bear away the bell for Wurzel, and Skirving for Swedes. As regards White Carrots, we have at home whole acres of much larger roots than any we saw there; the length of the tap-root of some exhibited exceeding 4 feet is a fact well worthy the consideration of your advocates for shallow ploughing. Among the implements we saw no addition worth noticing to the list of agricultural appliances exhibited at Shrewsbury. There were the usual number of machines of which without the information so readily afforded by the inventor would have puzzled not only the old jog-trot farmer but the most refined and scientific agriculturist to guess the name or divine the use. There were the usual number of complicated and expensive chaff-cutters, and we know not whether it is to be regarded as a sign of the revolutionary tendency of the times that the guillotine chaff-cutter, a modification of the old box and knife, made its appearance there, and seemed to promise better for simplicity and effectiveness than most of them. It would be rash, however, to judge of the merits of any implement without witnessing a more extended trial than can be exhibited at any agricultural Show. There is one point we would enforce again and again on the makers of improved agricultural implements, namely, that machines which are to stand the wear and tear of agriculture must be not merely presentable playthings, but simple, substantial and durable; and above all, they must be less costly than most of those which are produced in numbers almost as countless as projected railways. The number of patents which are taken out for agricultural machinery, and the unceasing activity with which mechanists rack their brains to construct traps to catch the farmers, show that they consider the agricultural world worth their enjoying. If they would enjoy it they must think it worth the winning; and the surest way to win it is by the qualities we have mentioned, and, above all, cheapness. That is the best toasted cheese with which they can bait their traps. Farmers are proverbial for liking a good bargain, and, as we have before observed, existing circumstances render the study of economy of more importance than ever to them.

One of the most striking and gratifying features of this, and other exhibitions of agricultural implements, is the activity and energy which is directed to the construction of machines by which the cost of manufacturing tiles and pipes for draining may be diminished. It is a proof that in agriculture, as elsewhere, the schoolmaster is abroad. Thorough drainage is the foundation of all improvement in agriculture, and whatever diminishes the cost of draining, diminishes the cost of producing human food. Dr. Johnson said that any fool could build a fine house, but that every fool could not adorn it with a fine tree. Given an ox of any of our improved breeds, and an unlimited supply of food, and any fool can fatten him; but we have millions of acres on which, in their present state, the wisest of men and the

best of farmers could not raise the Turnips for the ox. Cheap and effectual drainage removes the impediment, and sends up prize cattle from land that previously starved a goose. Machines for making drain-tiles, however, to be of any value, must produce them faster and cheaper than they can be made by hand. This is more than we would venture to affirm of all the tile-machines we have seen in operation to day. Ainslie's was the only one which produced a continuous stream of tiles. As a proof of its merits it may be stated that, a few years ago, we drained some hundred acres with tiles purchased at 40*s.* the thousand, and we have lately purchased the same description of tiles, made within a few miles of us with Ainslie's machine, at 18*s.* the thousand.

But to return to the special object of the Smithfield Club—the fat cattle—the following is the list of the prizes and commendations awarded by the judges :—

Judges.—For Beasts and Long-woolled Sheep : Mr. Thomas Parkinson, Mr. Franklin, Mr. Thomas Harris ; For Short-woolled Sheep and Pigs : Mr. William Tanner, Mr. R. Boys, Mr. Stace.

OXEN OR STEERS.

Class I.—*Oxen or Steers, of any breed, under 5 years old, without restrictions as to feeding, yet the kind or kinds of food must be certified.*

To Mr. Robert Martin Layton, of Thorney Abbey, near Peterborough, Cambridge, for a 4 years and 8 months old Hereford Ox, bred by Mr. Paul Prosser, of Garway Court, near Monmouth, Hereford, and fed on Hay, Green Clover, Swedish Turnips, Carrots, and Linseed-cake. Travelled to the Show on foot 2 miles, by van 60 miles, and by railway 98 miles.—*Prize* 20*l.* and *Silver Medal* to the Breeder, and *Gold Medal* as the best Ox or Steer in the 1st, 2d, 3d, 4th, and 5th Classes.

To Mr. William Woodward, of Bredons Norton, near Tewkesbury, Worcester, for a 3 years and 9 months old Improved Short-horned Steer, bred by himself, and fed on Grass, Hay, Swedish Turnips, Bean, Pea, Barley, and Mixed Meal, and Linseed-cake. Travelled to the Show by van 26 miles, and by railway 95 miles.—*Prize* 15*l.* [This we noticed as having taken the First Prize at the Gloucester Show the previous week.]

To His Royal Highness Prince Albert, of Windsor Castle, for a 3 years and 10 months old Short-horned Ox, bred by the late Lord Huntingfield, and fed on Cake, Turnips, Tares, Hay, Meal, and Potatoes. Travelled to the Show by van 22 miles.—*Prize* 10*l.*

To the Most Hon. the Marquis of Exeter, of Burghley, near Stamford, Northampton, for a 2 years and 11 months old Durham Ox, bred by his Lordship, and fed on Grass, Hay, Swedish Turnips, Oil-cake, Bean-meal, and Linseed-oil. Travelled to the Show by van 89 miles.—*Highly Commended.*

To Mr. John Davies, of Warden, near Biggleswade, Bedfordshire, for a 3 years and 1¾ month old Improved Short-horned Steer, bred by himself, and fed on Grass, Hay, Oil-cake, Swedish Turnips, and Cabbage. Travelled to the Show by van 45 miles.—*Commended.*

To Mr. John Steeds, of Frome Selwood, near Frome, Somerset, for a 4 years and 10 months old Hereford Ox, bred by Mr. Thomas Roberts, of Ivingtonbury, near Leominster, Hereford, and fed on Grass, Hay, Bean and Barley-meal, and roots. Travelled to the Show by van 12 miles and by railway 108 miles.—*Commended.*

Class II.—*Oxen or Steers, of any breed, under 6 years old, weight 90 stone and upwards, that shall not have had Cake, Corn, Meal, Seeds, Grains, or Distillers' Wash, during 9 months previous to the 1st of May, 1845.*

To Mr. Thomas White Fouracre, of Durston, near Taunton, Somerset, for a 3 years and 11 months old Devon Steer, bred by himself, and fed on Hay, Clover, Vetches, Roots, and about 12 bushels or 720 lbs. of Bean and Barley-meal. Travelled to the Show on foot 6 miles, and by railway 163 miles.—*Prize* 30*l.*, and *Silver Medal* to the Breeder.

To Mr. Henry Adams, of Calcut, near Cricklade, Wilts, for a 4 years and 8 months old Hereford Ox, bred by Mr. Charles Mason, of Tarrington, near Ledbury, Hereford, and fed on Grass, Hay, Turnips, and 1800 lbs. of Cake. Travelled to the Show by van 84 miles.—*Commended.*

Class IV.—*Oxen or Steers, of any breed, not exceeding 4 years and 3 months old, under 85 stone weight, that shall not have had Cake, Corn, Meal, Seeds, Grains, or Distillers' Wash, during 9 months previous to the 1st of May, 1845.*

To Mr. Thomas White Fouracre, of Durston, near Taunton, Somerset, for a 3 years and 11 months old Devon Steer, bred by himself, and fed on Hay, Clover, Vetches, Roots, and 720 lbs. of Bean and Barley-meal mixed. Travelled to the Show on foot 6 miles and by railway 163 miles.—*Prize* 10*l.* and *Silver Medal* to the Breeder.

To Mr. Wallett Goodale, of Boroberry House, near Peterborough, Northampton, for a 2 years and 11¼ months old Hereford Steer, bred by Mr. John Bishop, of Aldon, near Ludlow, Salop, and fed on Hay, Grass, Swede Turnips, and 300 lbs. of Cake. Travelled to the Show on foot 4 miles and by railway 110 miles.—*Prize* 5*l.*

Class V.—*Oxen or Steers, of any breed, under 4 years and 6 months old, and under 80 stone weight, without restrictions as to feeding, yet the kind or kinds of food must be specified.*

To Mr. Thomas Umbers, of Wappenbury, near Royal Leamington Spa, Warwickshire, for a 3 years and 6 months old North Devon Steer, bred by himself, and fed on Grass, Hay, Turnips, Barley and Pea-meal, and Oil-cake. Travelled to the Show on foot 5 miles and by railway 103 miles.—*Prize* 10*l.* and *Silver Medal* to the Breeder.

To the Rt. Hon. the Earl of Leicester, of Holkham Norfolk, for a 4 years and 4 months old North Devon Steer, bred by his Lordship, and fed on Swedish Turnips, Mangold Wurzel, Hay, Oil-cake, and Bean-meal. Travelled to the Show by van 40 miles and by railway 70 miles.—*Commended.*

To His Royal Highness Prince Albert, of Windsor Castle, for a 4 years old West Highland Ox, fed on Cake, Turnips, Tares, Hay, Meal, and Potatoes. Travelled to the Show by van 22 miles.—*Commended.*

COWS AND HEIFERS.

Class VI.—*Fattened Cows or Heifers, under 5 years old. Freemartins and spayed Heifers are not qualified.*

To Mr. W. Trinder, of Wantage, Berkshire, for a 3 years and 10 months old Durham Heifer, bred by the Right Hon. Lord Sherborne, of Sherborne, near Northleach, Gloucester, and fed on Hay, Cabbage, Swedes, Mangold Wurzel, Oat, Pea, and Barley-meal, and Oil-cake. Travelled to the Show on foot 2 miles, by van 52 miles, and by railway 63 miles.—*Prize* 20*l.* and *Silver Medal* to the Breeder, and *Gold Medal* as the best Cow or Heifer in Classes 6, 7, and 8.

To Mr. William Bennett, of Lewsey Farm, near Dunstable, Bedfordshire, for a 4 years and 7 months old Improved Short-horned Heifer, bred by himself, and fed on Grass, Hay, Turnips, Cabbage, and Oil-cake. Travelled to the Show by van 36 miles—has had one calf.—*Prize* 10*l.*

To Mr. Drinkwater Scott Hayward, of Frocester Court, near Stroudwater, Gloucester, for a 4 years and 11 months old Short-horned Cow, bred by himself, and fed on Oil-cake, Barley, Bean, and Lentil-meal, Hay, Mangold Wurzel, Swede Turnips, and Cabbage. Travelled to the Show by van 5 miles, and by railway 101 miles—has had one calf.—*Prize* 5*l.*

To Mr. William Firth, of Kirkstall, near Leeds, Yorkshire, for a 4 years and 8 months old Short-horned Heifer, bred by Mr. Jonas Whitaker, of Burley, near Otley, Yorkshire, and fed on Hay, Cake, Turnips, and Bean-meal. Travelled to the Show by van 3 miles, and by railway 234 miles.—*Commended.*

Class VII.—*Fattened Cows, of 5 years old and upwards. Freemartins and spayed Heifers are not qualified.*

To the Right Hon. the Earl of Radnor, of Coleshill House, near Farringdon, Berkshire, for a 5 years and 1 month old Hereford Cow, bred by Mr. Thos. Yeld, of the Broome, near Leominster, Hereford, and fed on Hay, Corn, Cake, Swedes, and Cabbages. Travelled to the Show by van 6 miles, and by railway 71 miles—has had one calf.—*Prize* 20*l.*, and *Silver Medal* to the Breeder.

To Mr. Morris Edward Lythall, of Hartshill, near Atherstone, Warwick, for a 5 years and 7 months old Durham Cow, bred by Mr. John Bowers, of Braunston, near Daventry, near Northampton, and fed on Grass, Linseed-cake, and Barley-meal. Travelled to the Show by van 11 miles, and by railway 94 miles—has had one calf.—*Prize* 5*l.*

Class VIII.—*Fattened Cows, of 5 years old and upwards, that shall have had at least two live Calves at separate births.*

To the Rt. Hon. the Earl of Leicester, of Holkham, Norfolk, for a 11 years and 2 months old North Devon Cow, bred by the late Mr. G. Talbot, of Temple Guiting, near Winchcomb, Gloucester, and fed on Swedish Turnips, Mangold Wurzel, Hay, Oil-cake, and Bean-meal. Travelled to the Show by van 40 miles, and by railway 70 miles—has had four calves.—*Prize* 15*l.*, and *Silver Medal* to the Breeder.

To Mr. James W. Walters, of Barnwood, near Gloucester, for a 9 years old Hereford Cow, bred by Mr. John Walker, of Luisley Court, near Worcester, and fed on Hay, Oil-cake, Carrots, Mangold Wurzel and Barley-meal. Travelled to the Show on foot 3 miles, and by railway 114 miles—has had four calves.—*Prize* 5*l.*

To the Hon. M. W. B. Nugent, of Higham Grange, near Hinckley, Leicester, for a 10 years and 6 months old Pure Leicester or Long-horned Cow, bred by Mr. Edward Thornton Twyeross, of Cauley, near Coventry, Warwick, and fed on Hay, Rape-cake, Grass, and boiled Barley. Travelled to the Show on foot 14 miles, by van 11 miles, and by railway 101 miles—has had five calves.—*Commended.*

To Mr John Smith, of Welton-Garth, near South Cave, Yorkshire, for a 7 years and 2 months old Short-horned Cow, bred by Mr. Samuel Beecroft, of Anlaby-road, near Hull, Yorkshire, and fed on Linseed-cake, Hay, Turnips, Grass, and Green Tares. Travelled to the Show on foot 1½ mile, and by railway 232 miles—has had three calves.—*Commended.*

Extra Stock.

To Mr. Nathaniel Bland, of Randall's Park, near Leatherhead, Surrey, for a 3 years and 10 months old Durham Short-horned Steer, bred by the late Mr. W. Calvert, of Hunsdon, near Ware, Herts, and fed on Grass, Oil-cake, Hay, Carrots, Swedes, Bean-meal, and bruised Linseed. Travelled to the Show by van 20 miles.—*Silver Medal.*

Not Competing.

To the Executors of the late Right Hon. Earl Spencer, of Althorp Park, Northampton, for a 4 years and 10 months old Short-horned Ox, bred by the late Earl Spencer, and fed on Grass, Hay, Turnips, Mangold Wurzel, and Oil-cake. Travelled to the Show by van 10 miles, and by railway 66 miles.—*Highly commended.*

To the Executors of the late Right Hon. Earl Spencer of Wiseton, near Bawtry, Nottingham, for a 4 years and 2 months old Short-horned Ox, bred by the late Earl Spencer, and fed on Oil-cake, Barley and Bean-meal, Turnips, Cabbages, and Hay. Travelled to the Show by van 21 miles, and by railway 172 miles.—*Highly commended.*

To the Executors of the late Right Hon. Earl Spencer, of Wiseton, near Bawtry, Nottingham, for a 9 years and 4 months old Short-horned Cow, bred by the late Earl Spencer, and fed on Oil-cake, Barley and Bean-meal, Turnips, Cabbages, and Hay. Travelled to the Show by van 21 miles, and by railway 172 miles.—*Highly commended.*

SHEEP.

Class IX.—*Long-woolled fat Wether Sheep, 1 year old, that have never had Cake, Corn, Meal, Seeds, or Pulse.*

To Mr. John Painter, of Burley, near Oakham, Rutland, for a pen of three 20 months old New Leicester Wethers, bred by himself.—*Prize* 20*l.* and *Silver Medal* to the Breeder, and *Gold Medal* as the best Pen of Long-woolled Sheep in the 9th, 10th, and 11th Classes.

To Mr. Thomas Twitchell, of Wellington, near St. Neot's, Beds, for a pen of three 20 months old Pure Leicester Wethers, bred by himself, from Rams hired of Mr. Samuel Bennett, of Bickerings Park, near Woburn, Beds.—*Prize* 5*l.*

Class X.—*Long woolled fat Wether Sheep, 1 year old, under 8 stone weight, that have never had Cake, Corn, Meal, Seeds, or Pulse.*

To Mr. Thomas Umbers, of Wappenbury, near Royal Leamington Spa, Warwickshire, for a pen of three 21 months old New Leicester Wethers, bred by himself.—*Prize* of 10*l.* and *Silver Medal* to the Breeder.

Class XI.—*Long-woolled fat Wether Sheep, 1 year old, without restrictions as to feeding.*

To Mr. Thomas Twitchell, of Willington, near St. Neot's, Beds, for a pen of three 20 months old Pure Leicester Wethers, bred by himself, from Rams hired of Mr. Samuel Bennett, of Bickerings Park, near Woburn, Beds.—*Prize* 20*l.* and *Silver Medal* to the Breeder.

To Mr. Richard Redgrave, of Bunker's Hill, near Boughton, Northampton, for a pen of three 21 months old Leicester Wethers, bred by himself, from Rams hired of Mr. Manning, of Orlingbury, near Wellingborough, Northampton.—*Prize* 5*l.*

To the Right Hon. the Earl of Aylesford, of Packington, near Coventry, Warwick, for a pen of three 20 months old Leicester Wethers, bred by his Lordship, from Rams hired of Mr. Pratt, of New Fields, Southam.—*Commended.*

Class XII.—*Long and Short-woolled Cross-bred fat Wether Sheep, 1 year old, without restrictions as to feeding.*

To Mr. John Hitchman, of Little Milton, near Wheatley, Oxford, for a pen of three 21 months old Hampshire and Oxfordshire Cross Wethers, bred by himself.—*Prize* 10*l.* and *Silver Medal* to the breeder.

To Mr. Charles Thompson, of Sundon, near Luton, Beds, for a pen of three 21 months old Down and Gloucester Cross Wethers, bred by himself.—*Prize* 5*l.*

Extra Stock—Long-woolled Sheep.

To Mr. William Sanday, of Holme Pierrepoint, Nottingham, for a 57 months old Leicester Ewe, bred by himself.—*Silver Medal.*

To Mr. Charles Large, of Broadwell, Oxfordshire, for a 56 months old New Oxfordshire Ewe, bred by himself.—*Highly Commended.*

To Mr. Wm. Smith, of Gaydon, near Kineton, Warwick, for a 116 months old Improved Cotswold Ewe, bred by himself, from a Ram hired of Mr. Garner, of Aldsworth, Gloucestershire.—*Highly Commended.*

To Mr. William Hewer, of Northleach, Gloucester, for a 57 months old Cotswold Ewe, bred by himself.—*Commended.*

Class XIII.—*Short-woolled fat Wether Sheep, 1 year old, without restrictions as to feeding.*

To Mr. Samuel Webb, of Babraham, near Cambridge, for a pen of three 20 months old South-down Wethers, bred by himself, from rams hired of Mr. Jonas Webb, of Babraham.—*Prize*, 20*l*., and *Silver Medal* to the Breeder, and *Gold Medal* as the best pen of Short-woolled Sheep in the 13th and 14th Classes.

To Mr. David Barclay, M.P., of Great Bookham, near Leatherhead, Surrey, for a pen of three 21 months old South-down Wethers, bred by himself.—*Prize* 5*l*.

To His Grace the Duke of Richmond, of Goodwood, near Chichester, Sussex, for a pen of three 20 months old South-down Wethers, bred by His Grace.—*Highly commended.*

To Mr. John Williams, of Buckland, near Farringdon, Berks, for a pen of three 21 months old South-down Wethers, bred by himself.—*Commended.*

Class XIV.—*Short-woolled fat Wether Sheep, 1 year old, under 8 stone weight, without restrictions as to feeding.*

To Mr. John Harris, of Hinton, near Abingdon, Berks, for a pen of three 18 months old South-down Wethers, bred by himself.—*Prize* of 10*l*. and *Silver Medal* to the Breeder.

To His Grace the Duke of Richmond, of Goodwood, near Chichester, Sussex, for a pen of three 20 months old South-down Wethers, bred by His Grace.—*Highly commended.*

Class XV.—*Short-woolled fat Wether Sheep, 2 years old, without restrictions as to feeding.*

To Mr. Samuel Webb, of Babraham, near Cambridge, for a pen of three 32 months old South-down Wethers, bred by Mr. H. J. Adean, of Babraham, from rams hired of Mr. Jonas Webb, of Babraham.—*Prize* 20*l*., and *Silver Medal* to the Breeder.

To His Grace the Duke of Richmond, of Goodwood, near Chichester, Sussex, for a pen of three 32 months old South-down Wethers, bred by His Grace.—*Prize* 5*l*.

Extra Stock. Short Woolled Sheep.

To Mr. W. B. Harris, of Hinton, near Abingdon, Berks, for an 18 months old South-down Wether, bred by himself.—*Silver Medal.*

To Mr. John Harris, of Hinton, near Abingdon, Berkshire, for a 32 months old South-down Wether, bred by himself.—*Highly commended.*

To Mr. Samuel Webb, of Babraham, near Cambridge, for a 20 months old South-down Sheep, bred by himself, from rams hired of Mr. Jonas Webb, of Babraham.—*Highly commended.*

PIGS.

Class XVI.—*Pigs, of any breed, above 13 and not exceeding 26 weeks old.*

To Mr. Charles Eley, of Heathfield Farm, near Hounslow, Middlesex, for a pen of three 18 weeks and 2 days old Berkshire and Yorkshire Pigs, bred by Mr. C. Eley, Sen., and fed on Buckwheat, Barley, and Pea-meal, and Milk.—*Prize* 10*l*., and *Silver Medal* to the Breeder.

To the Right Hon. the Earl of Radnor, of Coleshill House, near Farringdon, Berkshire, for a pen of three 18 weeks and 6 days old Coleshill Pigs, bred by his Lordship, and fed on Whey, Skimmed Milk, Barley-meal, and Potatoes.—*Prize* 5*l*.

Class XVII.—*Pigs, of any breed, above 26 and under 52 weeks old.*

To H. M. L. Whiting, of Heston, near Hounslow, Middlesex, for a pen of three 32 weeks and 4 days old Improved Buckinghamshire Pigs, bred by himself, and fed on Barley and Pea-meal, Skimmed Milk, and Linseed.—*Prize* 10*l*. and *Silver Medal* to the Breeder.

To Mr. W. F. Hobbs, of Marks Hall, near Kelvedon, Essex, for a pen of three 29 weeks and 2 days old Improved Essex Pigs, bred by himself, and fed on Oats, Peas, Meal, Potatoes, Mangold Wurzel, and Milk.—*Prize* 5*l*.

Extra Stock.—PIGS.

To Mr. H. M. Whiting, of Heston, near Hounslow, Middlesex, for a 32 weeks and 4 days old Improved Buckinghamshire Pig, bred by himself, and fed on Barley and Pea-meal, Skimmed Milk, and Linseed.—*Silver Medal.*

B. T. Brandreth Gibbs, *Hon. Sec.*

Miscellaneous.

Management and Composition of Manure (Boussingault, vol. ii. p. 52.)—In some farms it is the practice to keep the different kinds of manure distinct. The stable manure is kept apart from that of the stall; the produce of the sty from that of the fold. Circumstances sometimes make this necessary, but the supposed advantages may be doubted, and the notions on which they are maintained depend on observations which are far from being rigorous. Without denying the fact that certain crops flourish most with certain manures, it appears to me best to make one common heap only where there are no local difficulties: a mean quality is thus obtained, which, in all ordinary cases, is the most advantageous. The supposed distinctions are far too absolute, and, for this reason doubtless, it is very difficult to reconcile the various accounts. Thus, according to Sinclair, pig-manure is of all the strongest and richest in fertilizing principles, while, according to Schwertz it is, on the contrary, the worst.—The truth is, that manure heaps, arising from the same species of animal, differ often more in quality from one another than those which arise from various sources. The quality depends on the kind of food, the age, and condition of the animal which produces it. It is well known that the dung of beasts in the straw-yard is far inferior to that of the stall. When litter impregnated with animal digestions is accumulated in sufficient quantity in the yard, fermentation soon takes place; the temperature rises, and abundant vapours are disengaged. As amongst these volatile substances carbonate of ammonia is one, it is important to moderate its production; this is effected by keeping the mass tolerably moist, and preventing as much as possible the access of atmospheric air. The daily addition of new litter from the stable contributes greatly to prevent the dispersion of the volatile principle, which it is important to retain in the manure; properly spread it becomes an obstacle to evaporation; it forms a covering which condenses the vapour, while it keeps the lower bed from too intimate a contact with oxygen. While the manure heap is managed in this way, the fermentation is confined to the lower part of the mass. Thaer believes that air collected from the surface of a dung-heap in a moderate state of fermentation does not contain more carbonic acid than that which is collected from the atmosphere at a distance from the heap. Neither does a vessel containing nitric acid when placed near the fermenting mass produce those thick white vapours which are the sure sign of the presence of ammonia. The slow decomposition, which it is so desirable to produce, is not easily realized, except in sufficiently compact masses, in which the manure has been spread as equally as possible. An important point is to cart out the dung before the upper more recent portions are in a state of decomposition; otherwise the whole mass enters into an active state of fermentation, and the volatile substances being no longer arrested by the upper stratum escape and are lost in the air. A means of preventing this loss in the rare cases where it is desirable that the whole mass should be decomposed, would be, to cover it with vegetable soil, which would condense the volatile matters, and itself become a powerful manure. The dissipation of carbonate of ammonia is further prevented, during fermentation, by the application of salts capable of changing the ammoniacal carbonate into a fixed salt. On this account Monsieur Schattenmann, after having himself made trial of the plan, proposes to apply a certain quantity of sulphate of iron, or sulphate of lime, to fix the ammonia which is formed during the process of putrefaction. We must not, however, exaggerate the loss of ammonia in manure managed in the way we have recommended. It is in such cases, I believe, very trifling. Gentle fermentation presents characters essentially different from those of rapid putrefaction, which never fails to take place where proper precautions are not used. I have even seen horse-manure left to itself, without any addition of water, in the course of a few days acquire an immense heat, and take fire. I have seen it also reduced to an earthy state. Such are not the results of gradual decomposition. When the yard is cleared after a slow fermentation has taken place, the upper layer is almost in the same state as when brought from the stall or stable; that beneath it emits a slight smell of ammonia. In the inferior strata the change is greater; the straw has lost its consistence, is fibrous, and breaks with great ease; the colour is dark in proportion to the depth. Near the ground it is quite black, and smells like hydrosulphuric acid; it contains sulphuret of iron, the sulphuret arising doubtless from the decomposition of the sulphates under the influence of organic matter. It is from this indication that I judge best whether the manure hea hasp been well managed. The presence of sulphurets and hydrosulphate of ammonia need not be any cause of anxiety, for no sooner is the dung spread than they are transformed into sulphates, and it emits the musky odour which is peculiar to it. Doubtless such a condition of the manure is due to the treatment to which it has been subjected; the elements would have then another course in their decomposition had they been left to themselves. The purely ammoniacal odour developed in stables where the urine of herbivorous animals accumulates is a striking proof of the truth of this assertion. We can easily conceive how unfavourable to the proper preparation of manure, the practice, common as it is in some countries, must be of turning and exposing the manure to the air. It decomposes, indeed, much more rapidly, but it is at the expense of the quality, for it is clear, the more the surface in contact with the air is augmented, the more easily the volatile principles evaporate.—*M. J. B.*

Notices to Correspondents.

Berkshire Agriculture—*H*—The date of the work "Knight's Journey Book of Berkshire," quoted at p. 777, is 1840; published by Charles Knight and Co.

Bishop of Derry's Churn—*C*—Mr. Alex. Weston, Liverpool. See page 824.

Eccaleobion, or Apparatus for Hatching Eggs by Heat—*Rasore*—Can any of your correspondents give me any information concerning this art? I have a plan of my own, but think there is a way of doing it in a less time.

Gas-lime—*J A, Bromley*—Do not apply it fresh from the works, but mix it up in a compost of loose vegetable matter, leaves, &c., and after some months' exposure to the air apply such a quantity of the compost per acre as contains a waggon-load of the gas-lime.

Legislative Protection to Agriculture—*X X*—We cannot discuss this subject in our columns. We have read the pamphlet you allude to, and if you will favour us with your address, we shall be happy to give a private answer to your question.

Markets for Short-horns—*T Bowen*—Ashbourn, Derbyshire. 1st Tuesday in January and 13th February, is said to be a very good fair. We mention this as we suppose you are in immediate want. We shall shortly be prepared to give a fuller answer.

Skim Milk—*Rusticus*—What is the most profitable mode of consuming the milk which has been skimmed for churning, in a place where it cannot be sold or given to the poor?

Spring Manure for Potatoes—*Clericus*—4 cwt. of guano per acre early in *spring* is a very good dressing for autumn planted Potatoes. We have planted a lot of cut Ash-leaf Kidneys, at about 6 inches from the surface. The following is the figure of a good fork, only it is rather heavy:—

Fig. 1. Fig. 2.

Fig. 1. Front view of the fork. Whole length, 3 ft. 4 in. Handle, 2 ft. 2 in. Diam. 1⅝ in. Diam. near cross-piece, 1¼ in. Width of cross-piece or base of the trident, 7 in.; at the points, 6 in. The upper part of each lateral trident is ¾ in. in front, by ⅝ at the sides, where more strength is required; the centre one is ⅝ by 1 in., all gradually tapering to a point. Each strap appears to be ½ in. thick at its junction with the base of the trident, diminishing up the handle; they are 11 in. long, 2 in. wide. The handle goes down nearly to the cross-piece. The length of the trident is 1¾ in. Weight of the fork, 8 lbs. It appears to be made of a good material, as it is as sonorous as bell-metal: a file makes but little impression on it.

Fig. 2 is given to show the curve, which is similar to that of a spade or shovel.

Storing Roots, &c.—*R Taylerson*—You had better get your roots home, and on dry ground erect two parallel rows of hurdles about 3 yards apart: fill the interval with roots, pile them up in a roof-like form, and thatch them over. The Swedes are not nearly so sound this year as they were last; most of ours exhibit a tendency to rot in the appearance of a sort of juicy semi-transparent discoloration at the heart. Cattle and sheep eat them readily enough, however; but there is a good deal of waste owing to rottenness. Mr. Mecht is both alive and active, and you need not fear as to any non-performance by him of any of his engagements to the public, as soon as we receive them again.

Scotch Carts—*H Dawkins*—Our plans are quite at your service.

Supersulphate of Lime—*P L P*—There is no salt of the kind you describe. Sulphuric acid does not form a supersulphate with sulphate of lime; a *mixture* of gypsum and sulphuric acid forms a very good fixer for ammonia. *E.*

Terms of Entry and Board per annum at Cirencester College—*Oxygen*—Nomination by a shareholder, and £31 per annum. Application to the principal at Cirencester will obtain the fullest information.

Markets.

SMITHFIELD, Monday, Dec. 8.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	4s	6	to 4s	4	Best Downs & Half-breds	4s	8	to 5s 0
Best Short Horns	3	10	4	2	Best Long-wools	4	4	4 6
Second quality Beasts	3	0	3	6	Ewes and second quality	4	0	4 4
Calves	4	4	5	2	Pigs	4	0	5 0

Beasts, 3441; Sheep, 25,409; Calves, 59; Pigs, 381.

We have but a moderate supply of Beasts to-day, the time of year considered, the trade is somewhat depressed, yet late prices are fully maintained for the best qualities. There are a few more sheep in market, the trade is very heavy, the late prices for best qualities are with difficulty obtained, and second-rate descriptions are a trifle lower. Good Calves and Pigs continue dear.

Friday, Dec. 12.

The quality of this day's supply is interior, generally speaking, amongst which description trade is heavy. In the few best qualities prices of Monday are fully supported. Mutton is not very plentiful but is adequate to the demand; the best qualities are readily disposed of at Monday's quotations—inferior ones heavy on hand.—Good Veal is dear; choice Calf is worth 5s 4d; as also is good Pork.—Nice small Porkers make about 5s 4d.

Beasts, 1155; Sheep, 3090; Calves, 144; Pigs, 350.

WOOL.—British, Friday, Dec. 12.

There has been little or no variation in our market for some time past. The demand is still very limited, but prices cannot be said to have declined materially.

	per lb.				per lb.	
Long-woolled Wethers	1s	0	to 1s	1½	Southdown Hoggitts	1s 1d to 1s 3d
Do. Hoggitts	1	1	1	3½	Kent Fleeces	1 1
Southdown Fleeces	1	0	1	1		

James Perrin, Wool-Broker.

HOPS, Friday, Dec. 12.

The Market is in a very quiet state; we expect an advance as soon as Christmas is over.

Patterson & Swift, Hop-Factors.

HAY.—Per Load of 36 Trusses.

Smithfield, Dec. 11.

Prime Mead. Hay	85s	to 90s	New Hay	—s	to —s	New Clo. —s to —s
Infr. New & Rowen	35	75	Clover	85	to 115	Straw 25

John Cooper, Salesman.

Prime Mead. Hay	90s	to 95s	Old Clover	115s	to 120s	Straw 33s to 36s
Inferior	70	84	Inferior do.	86	102	
New Hay	—	—	New Clover	—	—	

Joshua Baker, Hay Salesman.

Whitechapel, Dec. 12.

Fine Old Hay	90s	to 95s	Old Clover	120s	to 126s	Straw 33s to 36s
Inferior Hay	—	—	New Clover	100	105	
New Hay	70	84	Infr. do.	70	80	

Supply large and trade very dull at the above prices.

COVENT GARDEN, Dec. 13.—Little alteration in anything has taken place during the week; the supplies of most articles have been good, and trade tolerably brisk. Pine-apples continue to be sufficient for the demand, and Hothouse Grapes, although scarcer, are brought in considerable quantity; foreign sorts are plentiful. The supply of Apples is well kept up, and that of Pears also sufficient for the demand. Oranges are becoming more abundant, and prices for them are in consequence lower. Lemons are also cheaper. Nuts are not so plentiful. Of Vegetables the supplies of most articles are sufficient for the demand. Cauliflowers are, however, scarcer; but Broccoli is abundant and Savoys, Brussels Sprouts, and other winter Greens are plentiful. Carrots and Turnips are excellent in quality, and sufficient for the demand. Potatoes have altered very little in price since last week, and, although a great many of them are still affected by the prevailing disease, yet, upon the whole, they may be said to be better in quality than the samples hitherto produced. Seakale is more plentiful, and the same may be said of French Beans. Celery, both red and white, is good and abundant, and Lettuces, Endive, and other kinds of salading, are sufficient for the demand. Cut Flowers chiefly consist of Euphorbias, Bignonia venusta, Epiphyllums, Acacias, Heaths, Heliotropes, Cinerarias, Pelargoniums, Camellias, Chinese Primroses, Chrysanthemums, Violets, and Roses.

FRUITS.

Pine-Apple, per lb., 4s to 6s
Grapes, Hothouse, per lb., 3s to 6s
— Spanish, per lb., 9d to 1s
— Portugal, p. lb., 9d to 1s 6d
Melons, Spanish, each, 4s to 10s
Apples, Hess., per bush., 4s to 6s
— Kitchen, 2s 6d to 5s 6d

Chervil, per punnet, 2d to 3d

POTATOES.—SOUTHWARK, WATERSIDE, Dec. 8.

There has been a considerable clearance of Potatoes at the Waterside during the past week, and the town markets would have felt the shortness of the supply had it not been for the quantity that was sent by the railways and through the canals principally from the inland counties that do not usually contribute to the supply of the London market. There was some few fresh arrivals from Yorkshire and Scotland on Saturday and Sunday last, and considering the length of time that some of those cargoes had been on their passage they looked in better condition than many of those of former shipments. Prices range as follows:—York Reds, from 10s to 120s per ton; ditto Regents, 100s to 130s per ton; ditto Blues, 55s to 60s per ton; Scotch Reds, 30s to 80s per ton.

MARK-LANE, MONDAY, Dec. 8.

The supply of Wheat by land carriage samples from Essex, Kent, and Suffolk, was small this morning, and the millers availing themselves of the present uncertain state of the trade, (created by the report of the *Times* paper, which we believe to be false), succeeded in purchasing the same at a reduction of 3s. per qr. under the prices of this day se'nnight; holders of free Foreign and Bonded refusing to sell at any decline, few, if any, transactions occurred in these descriptions. Fine Malting Barley sold freely, but secondary qualities were difficult of disposal. Beans must be noted 1s. and Peas of all kinds 2s. to 3s. per qr. cheaper. Oats are a slow sale, at a decline of 1s. per qr. The top price of Flour is altered to 57s. per sack.

FRIDAY, Dec. 12.

As it is generally considered that the change of Administration must prolong the uncertain fate of the Corn-laws, business this morning in all descriptions of Grain, either free or bonded, was completely at a stand-still, and the value of each may be considered nominally the same as on Monday.

KINGSFORD AND LAY.

Sales by Auction.

HORSELL, SURREY, HALF A MILE FROM THE WOKING STATION ON THE SOUTH-WESTERN RAILWAY.
VALUABLE NURSERY STOCK.

MR WATERER will sell by Auction on Monday, December 15, 1845, and following day, at 10 o'clock for 11 precisely, on the premises, the whole of the valuable and well-selected NURSERY STOCK of Mr. Stephen Spooner (declining business), at Horsell, comprising One Hundred Thousand FIRS AND FOREST TREES, including Spruce, Larch, Pinaster, Stone Pine, and other Firs, from 1 to 12 ft.; Poplars of sorts, Turkey and common Oak, Ash, Beech, Birch, Alder, Lime, and other varieties; two thousand Flowering Shrubs and Evergreens, Portugal and common Laurels, Laurestines; Alexandra Laurel, striped and green Holly, Berberis, and Althænas, from 1 to 4 ft.; Phillyreas and Yew, from 3 to 5 ft.; green and variegated Box, from 1 to 5 ft.; Pyruses of sorts; 300,000 bedded and Seedling Quick, a large quantity of Seedling Oak, Birch, Ash, Spruce Firs, and Sycamore; eight thousand Standard and Dwarf Roses of the most choice sorts; six thousand Standard and Dwarf Fruit Trees, including Apples, Pears, Cherries, Peaches, Apricots, and Plums of the best sorts; Rhododendrons, Kalmias, and Azaleas; Honeysuckles, a large quantity of Mussel, Brussels, Crab, and other Stocks; the whole in great perfection, and will remove safely, having been transplanted within the last three years. May be viewed three days previous to the sale, and Catalogues had on the premises, and will be forwarded by post on application by letter, inclosing four postage stamps, to Mr. STEPHEN SPOONER, Horsell, Surrey; or to Mr. WATERER, Auctioneer, Land and Timber Surveyor, Chertsey, Surrey.

EXTENSIVE SALE OF NURSERY PLANTS.

MESSRS. TOMPSETT & ALLEN have received directions from Mr. HOOKER, to Sell by Auction, on Wednesday, the 17th of December, and the Six following days, the whole of his STOCK OF PLANTS, now standing upon more than Twenty acres of land, in the Parish of Brenchley, Kent. The STOCK comprises the usual variety of Nursery Plants, many of which are rare and of large size. The Sale to commence at Ten o'clock precisely on each day, in consequence of the shortness of the days. Catalogues may be had of Mr. G. Charlwood, Seedsman, Covent-garden; of the Auctioneers, West Peckham; and on the Premises, one week before the sale. Brenchley is 7 miles from Tunbridge-wells, and 3 from the Paddock-wood Station of the Dover Railway. Post town—Cranbrook.

TO NOBLEMEN, GENTLEMEN, FLORISTS AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Monsieur Louis Van Houlte, (Nurseryman and Florist to the King of the Belgians), to submit to public competition at the Auction Mart, Bartholomew Lane, London, on Friday, Dec. 19, 1845, at 12 o'Clock, about Eight Hundred CAMELLIAS, consisting of all the esteemed varieties, most of which are beautifully furnished with bloom buds. Also Two Hundred GHENT AZALEAS, comprising all the finest sorts, which are also well furnished with bloom. The Plants will be on view at the Mart one day prior and morning of Sale, where Catalogues may be had: also of the Auctioneers, American Nursery, Leytonstone.

FENCING, GYMNASTIC, AND CALISTHENIC EXERCISES.

MR. J. CHIOSSO, Superintendent of the above branches of physical education at University College, London, begs to announce that his Academy, 21, New-road, corner of Gower-street, is open on Monday, Tuesday, and Thursday from 10 till 7 in the afternoon, and will be open every day during the Christmas Holidays. Exercises adapted for peculiar cases of Debility or Deformity will be attended to individually at convenient hours. Schools and private families attended. For terms apply at the Academy.

SALE OF PLANTS, THE PROPERTY OF A GENTLEMAN LEAVING THE NEIGHBOURHOOD.

MR. DUCKWORTH WILL SELL BY AUCTION, on Thursday the 18th December, on the premises, New Lodge, near Barnet, a quantity of fine healthy GREENHOUSE PLANTS, including Indian Azaleas, Camellias, &c. Some of the latter are extra fine specimens, and well set with bloom.

There are also 800 pots of Strawberries in first-rate condition, for early forcing. Sale to commence at 1 o'clock.

Barnet, December 10.

DORKING, SURREY.—TO NURSERYMEN.

TO BE DISPOSED OF immediately, the old-established NURSERY BUSINESS OF MR. ROBERT WESTLAND, in an eligible situation at Dorking, fronting the Turnpike-road. The whole of the Stock to be taken at a valuation. The commodious House, with the Seedshop, useful Out-buildings, and Nursery Garden, is let at a moderate Rent, and may be entered upon immediately.

For particulars, apply to Messrs. HART & HART, Solicitors, Dorking, Surrey.

THE URATE OF THE LONDON MANURE COMPANY, FOR TARES, TURNIPS, WHEAT, &c., at Four Guineas per Ton.—The above Manure having stood the test of many years' experience, is recommended with the greatest confidence: being uniform in its manufacture, it may be relied upon at all times, thereby preventing those great disappointments which frequently occur from the difficulty of obtaining Guano and other Manures in a pure state. It will be found most useful for Wheat on all soils, where it is requisite to procure a full plant early in the autumn. Full particulars and testimonials forwarded on application. The Company also supply genuine Peruvian and African Guano, Sulphuric Acid, Gypsum, and every artificial Manure, at the lowest market price, and warranted of the best quality.

40, New Bridge-st., Blackfriars. E. PURSER, Secretary.

LIEBIG'S WHEAT MANURE now ready for delivery.

GYPSUM.—PURE GYPSUM (in fine powder), in 5-ton lots at 25s. per ton in the stream, or 27s. 6d. per ton landed. Also Guano (Peruvian and African), Superphosphate of Lime, Bones, Sulphuric Acid, and all other manures of known value, on Sale. By MARK FOTHERGILL, 40, Upper Thames-street, London.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed: Garden, Ship, and Barge Pumps; also those for Distillers, Brewers, Soap Boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

FOREIGN SHEET GLASS.

C. JARVIS having just imported a large quantity of the above article, in quality and substance hitherto unequalled, can offer it to purchasers at a lower price than any other house in the trade, at his old established WINDOW GLASS WAREHOUSE, 38, Great Castle-street, a few doors from Regent-street.

CROWN GLASS in Crates or Squares equally low.

IMPROVED DIBBLING MACHINE.

JOHN WEATHERSTONE begs to inform the Agricultural Public that his PATENT HORSE-DIBBLING MACHINE is now ready, whereby the greatest regularity may be insured in the deposition of all Seeds. A team of four horses will be found sufficient power to draw one of the largest size.

Price of Machine, with six rows £35
„ eight rows 40
„ ten rows 45

Applications for further particulars may be made to Mr. JOHN WEATHERSTONE, Cassington, near Oxford; or to Messrs. GILL and WARD, High-street, Oxford.—Agents wanted in all parts of the country.

DINGLE'S HAND-DIBBLING MACHINE.—Twelve of these Machines were be exhibited at the Great Smithfield Cattle Show, on Wednesday, December 10th and following days. Two are now manufactured together to plant a double quantity, thereby effecting a great saving in labour and seed.—WILLIAM E. RENDLE & Co., Plymouth, Dec. 13.

THRASHING MACHINES, made Warranted not to Damage the Straw.—Mrs. MARY WEDLAKE, Widow of the late Mr. THOMAS WEDLAKE, of the original Fairkytes Iron Works, Essex, and 118, Fenchurch-street, opposite Mark-Lane, City, established upwards of 40 years, begs respectfully to remind Agriculturists that she continues to manufacture these excellent Machines, made, and first introduced, by her late husband these 30 years, and now much improved. Warranted not to damage the Straw. Numerous references to parties using the Implement may be had.

Patent light Ploughs, and Superior Dressing Machines, also patent Chaff-cutting Machines made on scientific principles, may be seen at 118, Fenchurch-street, repository opposite Mark-lane; also, Horse-Rake, and DINGLE'S new Hand Dibbling-Machine so much approved of. City Repository for Agricultural Implements, 118, Fenchurch-street, opposite Mark-lane.

CHEAP AND DURABLE ROOFING,
AND THE BEST RESISTER OF FROST FOR GARDEN PURPOSES.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers and only Patentees of
THE PATENT ASPHALTED FELT FOR ROOFING,

and which for many years has been in extensive use for Roofing Houses, Verandahs, all kinds of Farm Buildings, Sheds, and for COVERING GARDEN FRAMES. TO PROTECT PLANTS AGAINST THE EFFECTS OF THE FROST, beg to call the attention of Gardeners and others to their superior article, *which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and obtained the Prize for being the best and cheapest article for roofing, &c.*, and is also patronized by Her Majesty's Board of Ordnance, Commissioners of Woods and Forests, the Hon. the East India Company, and the Botanical Gardens, Regent's-park. It is extensively used in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference is made. This Felt is composed of the strongest and most durable materials, and is saturated with the BEST OF ASPHALTE OR BITUMEN (THE SAME AS SELECTED AND USED BY SIR ISAMBERT BRUNEL FOR THE THAMES TUNNEL, BEING FOUND THE MOST ELASTIC AND EFFECTIVE RESISTER OF WET). NO OTHER FELT HAS THIS ASPHALTE BUT F. M'NEILL & CO.'s, and which renders it impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience (which contain much useful information), from Noblemen, Gentlemen, Gardeners, Architects, and Builders, SENT FREE to any part of the Town or Country, and orders by Post executed.

The new Vice-Chancellor's Courts, the Offices attached, and Passages leading to Westminster-hall, Dr. Reid's Offices, and other Buildings at the New Houses of Parliament, are roofed with F. M'NEILL and Co.'s Felt, and is known by its having the appearance of lead roofs.

☞ The Public are respectfully cautioned against misrepresentation, as the only Works in Great Britain where the above Patent Roofing is made, is F. M'NEILL & Co.'s Manufactories, Lamb's-buildings, Bunhill-row, London.

PHOSPHORIC RAT POISON.—This preparation is offered to the Public with the greatest confidence, being decidedly superior to all those poisons containing arsenic and other minerals. It is most greedily eaten by rats and mice as long as it is offered to them and invariably proves certain destruction. Prepared only by EDWARD PURSER, 40, New Bridge-street, London. Sold in pots, with full directions for use, at 4s., 8s., and 20s. each.

MECHI'S NOVELTIES FOR CHRISTMAS PRESENTS.—The greatest variety for Ladies and Gentlemen, both in price and choice, are at MECHI'S Manufactory, and Emporium of Elegance, 4, Leadenhall-street, London, where may be suited the economist or the luxurious. Bagatelle tables, 3l 10s. to 13l 10s; writing desks, 10s. to 20l; dressing-cases, 20s. to 100l; work-boxes, 12s. to 20l; leather writing-cases (with or without dressing-case), 18s to 16l; tea-chests, 7s 6d, to 8l; envelope-cases, 10s. to 10l; inkstands in bronze, wood, and papier maché, 5s. to 4l 8s; splendid papier maché work tables, 10l 10s; sets of tea-trays, 8l to 20l; work and cake baskets, 25s. to 50s; card-racks, 26s. to 40s; hand-screens, 18s. to 48s; netting-boxes, 25s to 27s; card-boxes, 2l, to 3l 3s; pole-screens, 4l 10s per pair; ladies' folios, richly painted, 30s, to 3l 3s; ladies' companions, or pocket work-boxes, in pearl, shell, paper, and leather, at all prices; ladies' scent and toilet bottles, 7s 6d, to 3l 3s; ladies' card cases, 10s to 5l; elegant chess-boards, and ivory chess-men, various prices, to 16l 16s; watch-stands, 27s each; gold and silver pencil-cases; elegant cases of seven-day razors, from 25s, to 10l 10s; ivory-handled and Scotch strops in every variety; sporting knives, 10s to 3l; splendid Wharncliffe knives; ladies' scissors, 5s to 50s per pair; cases of plated and silver desserts, to 25l; cases of splendid table cutlery, to 40l; and a variety of other articles, of which catalogues may be had gratis. As MECHI manufactures extensively on his own premises, the quality of every article is warranted. Table-cutlery, Sheffield-plate, &c.

THE ARCHÆOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.

Editor of the Publications of the ARCHÆOLOGICAL INSTITUTE and Resident Secretary, T. HUDSON TURNER, Esq. Hon. Member Ant. Soc. of Newcastle.

THE ARCHÆOLOGICAL INSTITUTE of Great Britain and Ireland is formed in order to examine, preserve, and illustrate all Ancient Monuments of the History, Manners, Customs, and Arts of our Forefathers.

The means by which the Central Committee propose to effect this object are—

1. By holding communication with correspondents throughout the Kingdom, and with provincial Antiquarian or Architectural Societies: as well as by direct intercourse with the Comité des Arts et Monuments of the Ministry of Public Instruction in France, and with other Associations on the Continent instituted for the advancement of Antiquarian Science.

2. By holding frequent and regular meetings for the consideration and discussion of communications received from correspondents and other persons.

3. By procuring careful observation and preservation of Antiquities discovered in the progress of Public Works, such as railways, foundations of buildings, &c.

4. By encouraging individuals, or public bodies, in making researches and excavations, and affording them suggestions and co-operation.

5. By opposing and preventing, as far as may be practicable, any injuries with which Ancient National Monuments of every description may from time to time be threatened.

6. By using every endeavour to spread abroad a correct taste for Archæology, and a just appreciation of Monuments of Ancient Art.

7. By collecting accurate drawings, plans, and descriptions of Ancient National Monuments, and by means of correspondents preserving authentic memorials of antiquities which may from time to time be brought to light.

8. By establishing a Journal devoted exclusively to the objects of the Institute, as a means of spreading antiquarian information, and maintaining a constant communication with all persons interested in such pursuits.

9. By taking every occasion which may present itself to call the attention of the Government to the conservation of our National Monuments, and to the other objects of the Institute.

RULES AND REGULATIONS OF THE ARCHÆOLOGICAL INSTITUTE.

I. THE ARCHÆOLOGICAL INSTITUTE of Great Britain and Ireland shall consist of Life Members, contributing a donation of not less than 10*l.*, of Annual Members contributing not less than 1*l.* each year, and of Corresponding Members who, taking an interest in the objects of the Institute, and being disposed to give furtherance to them without any pecuniary contribution, may desire to attach themselves to the Institute. The Corresponding Members shall not be entitled to vote, nor have any other privileges.

II. The Government of the Institute shall be vested in a Central Committee, consisting of a President, four Vice-Presidents, three Honorary Secretaries, a Treasurer, and twenty-four ordinary Members.

III. The President's tenure of office shall be for one year.

IV. The Honorary Secretaries and Treasurer shall be elected by the Committee, who shall also have the power of electing a Secretary, at such a salary as they may consider proper.

V. The Election of the President, Vice-Presidents, and Members of the Central Committee shall be made by the ballot of the Life and Annual Members at the Annual Meeting. The Committee shall select one Vice-President and six members of their body, who are to go out annually, and shall nominate one Vice-President, and six other Members to fill up the vacancies. The names of those who go out, and of those who are proposed to supply their places, shall be hung up in the Local Committee Room during the whole time of the Annual Meeting, and a printed copy of such lists furnished to each Member of the Institute, with his ticket for the Annual Meeting. No Member of the Committee, except the Honorary Secretaries and Treasurer, shall remain on the Committee more than four years, or be eligible to serve again until after the lapse of one year. Any Member of the Institute is at liberty to substitute on the list other name or names for those proposed by the Committee.

VI. The Committee shall be empowered to fill up *pro tem.* by election all occasional vacancies that may be caused by the death or resignation of the President, or any of the Vice-Presidents or ordinary Members of the Committee.

VII. These vacancies shall be supplied on the recommendation of at least three Members of the Committee, made in writing at one of the ordinary Meetings; the proposed Member to be balloted for at the succeeding ordinary Meeting.

VIII. The Annual Meeting shall be holden in one of the cities or principal towns in the kingdom, at which the elections, the appointment of the place of meeting for the ensuing year, &c., shall take place. Notice of this Meeting shall be given by one of the Honorary Secretaries, by order of the Committee.

IX. The Committee shall have the power of nominating a certain number of Local Vice-Presidents.

X. No other General Meeting of the Institute shall be holden without the consent of at least three-fourths of the Committee, expressed in writing; for such Special Meeting, a notice of at least three weeks shall be given by advertisements in the public papers. At this Special Meeting, the President, or, in his absence, one of the Vice-Presidents, shall take the chair, and, in their absence, the Committee shall appoint a Chairman.

XI. Neither at the General Annual Meeting, nor at any Special General Meeting, shall any alteration of, or addition to, any of the Rules or Regulations of the Institute be submitted to the Meeting, unless upon a proposal in the form of a resolution in writing, signed by two Life or Annual Members: which shall have been sent to the Committee one month previous to the Meeting, and suspended in their committee-room.

The Summons for the Special General Meeting shall specify the Resolution or Resolutions to be submitted to the Meeting, and the discussion shall be confined to that object only: in case such proposed Resolution or Resolutions shall be carried, another Special General Meeting shall be summoned by the Committee after the lapse of not less than a fortnight, or more than a Month, for the sole purpose of ratifying or rejecting such Resolution. If, however, the first-mentioned Special Meeting take place at a tme not more than two Months before the Annual Meeting, then such Resolution or Resolutions shall be ratified or rejected at that Annual Meeting.

XII. The Chairman of the Annual, or any other General Meeting, shall have an Independent as well as a Casting Vote.

XIII. A certain number of persons, not usually resident in London, shall be associated with the Central Committee as Honorary Members of that Body, and shall be entitled to a Vote at their Meetings. Such Honorary Members shall be proposed on the recommendation of at least three Members of the Committee, and the Election shall take place at the succeeding Ordinary Meeting.

XIV. The Committee shall appoint a certain number of persons, not resident in London, as their Local Secretaries.

XV. The Election of Local Secretaries and Corresponding Members shall be made by the Committee on the proposal of one of the Members thereof, either on his own personal knowledge or on the recommendation of two subscribing Members of the Institute.

XVI. In these and all other Elections made by the Committee, it shall be allowable for any Member thereof to demand a Ballot.

XVII. Subscriptions and Donations may be paid to the Treasurer, to any Member of the Committee, or to the Account of the Archæological Institute with the Bankers of the Institute, and no Subscriber shall be entitled to Vote at the Annual Meeting who has not paid his Subscription. The Year shall be considered as closing with the termination of the Annual Meeting; from which time the Subscription for the ensuing year shall become due.

XVIII. The Cash Book, and an account of all Receipts and of the Balance in the Bankers' hands, shall be laid on the table at each Meeting of the Central Committee. All Bills having been duly examined, and approved in writing, shall be paid by Cheque upon the Bankers, signed by the Treasurer.

XIX. The Accounts of the Institute shall be submitted Annually to two Auditors, who shall be elected for that purpose by the Members of the Institute at the General Meeting, and who shall attest by their Signatures the accuracy of the said Accounts. The Accounts having been thus approved, shall be submitted to an Annual Meeting of the Committee, to be holden on the First Wednesday in May, and shall be printed and published in the Journal of the Institute as part of the proceedings of the Committee.

XX. A Report of the Proceedings of the whole year shall be submitted to the Annual Meeting.

XXI. The Central Committee shall be empowered to make such Bye-Laws as may, from time to time, appear to them expedient.

The Central Committee request the Local Secretaries to attend, whenever it may suit their convenience, the Ordinary Meetings, which take place once in every fortnight at the apartments of the Institute, 12, Haymarket, for the discussion of Archæological communications and the exhibition of objects of interest.

ORDINARY MEETINGS OF THE CENTRAL COMMITTEE

12, HAYMARKET. *The Chair taken at Four o'clock.*

Subscriptions may be paid to the Bankers, Messrs. COCKBURNS, 4, Whitehall. All communications should be addressed to T. HUDSON TURNER, Esq. 12, Haymarket,

Introduction to Liebig's "Agricultural Chemistry."
People's Edition, small 8vo., 4*s.* 6*d.*, sewed; 5*s.* cloth
LECTURES TO FARMERS ON AGRICULTURAL CHEMISTRY. By ALEXANDER PETZHOLDT.
"It is the first work we have seen in which the chemist has condescended to write so as those not initiated in the mysteries of the science may understand what he writes about."—*Northern Star.*
London: TAYLOR and WALTON, 28, Upper Gower-street.

On the 1st of January, 1846 (to be continued Quarterly), will be published PART I. of
THE JOURNAL OF THE HORTICULTURAL SOCIETY OF LONDON, containing 96 pages in 8vo with one Coloured Plate and other Illustrations, price 5*s.*
In this work it is intended to publish periodically an account of the Proceedings of the Society, the Journals of the Society's Collectors, Papers on Horticultural Practice, or Subjects connected with Gardening, Reports upon the new Esculents, Fruits, or ornamental Plants, that may be from time to time introduced, an account of all Experiments tried in the Garden, and such other matter bearing upon Horticulture as may appear interesting to the Public. It will be distributed gratuitously to the Fellows of the Society, instead of the 4to Transactions: which will be discontinued after the completion of the current volume.
Fellows, Corresponding Members, and others, are invited to forward communications upon all matters *of either theory or practice*, to the Vice Secretary, at the House of the Society, 21, Regent-street, London.

THE TENANT FARMERS' ADVOCATE.—It is abundantly manifest that the position of the Agricultural Interest as a class is undergoing and must undergo a great change. In such change the relative position of "LANDLORD AND TENANT" will form the most important feature, and the establishment of a sound system of "Tenants' Rights" will be a cardinal point for "Tenant Farmers." For 14 years THE MARK-LANE EXPRESS AND AGRICULTURAL JOURNAL has been the zealous and uncompromising advocate of the TENANTS' RIGHTS, and with the conviction that the interests of the Tenantry are vitally involved in the question, the columns of this Journal will be continuously devoted to its discussion and elucidation. Published every Monday in time for Post. May be had by order of all Booksellers and Newsmen.—Office, 24, Norfolk-street, Strand, London. Price 1*l.* 10*s.* 4*d.* per annum.

THE CORN AND PROVISION TRADES.—The deficiency of the Harvest, the failure of the Potato Crop, and the consequent serious effects upon commercial and monetary affairs, excite great apprehension. Under such circumstances, correct information as to the produce of the harvest, the extent of the failure of the Potato Crop, the state of the markets, the stock of grain on hand, on the continent of Europe, and in the United States, is of the highest importance. No trouble or expense is spared to furnish such information, which is brought down to the latest moment of going to press, in the MARK-LANE EXPRESS, which has been for many years the authority in the Corn and Provision Trades in England and in foreign countries. Published every Monday in time for post, and may be had by order of all Booksellers, Newsmen, &c. Office, No. 24, Norfolk-street, Strand. Price 1*l.* 10*s.* 4*d.* per annum.

ROWLAND'S MACASSAR OIL, for inducing an *exuberant growth of HAIR*, and for imparting a *permanent gloss*, and *a tendency to curl*. REMAINS UNRIVALLED—Weakness, Premature-Greyness, Relaxation, and tendency to fall off being entirely prevented by this "incomparable" Oil.
Its purifying properties dispel all Scurf and Dandriff, and for Children it is especially recommended as forming the Basis of a BEAUTIFUL HEAD OF HAIR. As a mild stimulative, corrective and preservative agent, ROWLAND'S MACASSAR OIL has the exclusive Patronage of the several Sovereigns and Courts of Europe, and with rank, fashion and discernment, supersedes all preparations of professed similar import.
Being universally preferred, its consequent great demand excites the cupidity of unprincipled Shopkeepers, who vend the most spurious trash as "*Macassar Oil.*" It is therefore imperative on Purchasers to see that the words
ROWLAND'S MACASSAR OIL
are engraved in two lines on the Wrapper; and on the back of the *Wrapper* nearly 1,500 times, containing 29,028 letters.—Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small) 10*s.* 6*d.*, and double that size, 21*s.* per Bottle.
Sold by the Proprietors, A. ROWLAND & SON, 20, Hatton Garden, London, and by Chemists and Perfumers.
*** All other "*MACASSAR OILS*" are FRAUDULENT COUNTERFEITS!!!

Printed by WILLIAM BRADBURY, of No. 6, York-place, Stoke Newington, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday December 13, 1845.

ROYAL BOTANIC SOCIETY OF LONDON, REGENT'S PARK.—The days fixed for the Exhibition of Plants, Flowers, and Fruit, in the Gardens of this Society next year, are Wednesdays, May 20, June 3, and July 1. Schedules of Prizes will shortly be ready.

SEED TRADE.

J. G. WAITE'S WHOLESALE CATALOGUE of GARDEN SEEDS is now ready, and can be had on application at 4, Eyre-street Hill, Hatton Garden.

SUPERIOR NEW EARLY PEA.—WARNER'S "EARLY EMPEROR" Pea, the earliest in cultivation, quite hardy, a good Cropper, with fine Pods, and most delicious flavour. Height about 2 ft.—5*s*. per quart.—To be had of Warner and Warner, Seedsmen, 28, Cornhill, London.

"CINERARIA BLADWOOD"—THE GREATEST NOVELTY OF THE SEASON.

S. WALTERS, Florist, Hilperton, Wilts, has much pleasure in offering to Public notice, the above truly beautiful Variety. (See *Gardeners' Chronicle*, May 27, 1845, under the initials "H.D."):—"Your Cineraria is the most novel in appearance which has come under our notice this season; the dark disk, with petals equally even, divided into white and crimson, with the colour breaking off abruptly, gives it a singular and gay appearance."

Plants in April 7*s*. 6*d*. each. Early orders only can ensure plants.

JESSOP'S NURSERY, CHELTENHAM, Established in 1815, from its extensive connections offers peculiar advantages to Noblemen and Gentlemen requiring Gardeners, Foresters, or Farm-Bailiffs of established skill and reputation. All communications promptly attended to.

BECK'S SEEDLING PELARGONIUMS, 1844.—E. Beck informs the public that his sale of the above will terminate on January 1st, 1846. The small portion remaining are well established in 4½-inch pots. N.B.—E. B. proposes to send out another selection after the Exhibitions of 1846.

Worton Cottage, Isleworth.

TO THE PLANTERS OF ENGLAND AND LOVERS OF THE PICTURESQUE.

JAMES GRIGOR, Nurseryman, Norwich, begs to state that he is now sending out plants of the True HIGHLAND PINE, a noble landscape ornament, and a tree which produces very superior timber.

"I very particularly admire the Highland Pine; its growth, and leaf, and bark, are beautiful. I shall be truly proud of my first specimens, of which I beg you will send me 1000 of your finest for trial. I am very much obliged to you for calling my attention to trees of such value."—*Newcastle (Duke of), Clumber, December* 2, 1844.

"Now that we are on the subject of trees, I may mention what I have very likely told you in some of my previous letters, that I prefer the Highland Pine to all other trees except the Oak, taking into consideration its beauty in winter, and by moonlight, and in the evening."—*Wm. Wordsworth, Rydal Mount, Dec.* 7, 1844. Who, then, would be without this tree?

Plants	1 to 2	inches	.....	5*s*. per 1000

Norwich, Dec. 20.

TRANSPLANTED LARCH 3 TO 4 FEET.

MESSRS. WILLMOTT and CHAUNDY, Nurserymen and Seed Growers, Lewisham, Kent, have a quantity of twice-transplanted LARCH, 3 to 4 feet high, to dispose of at a moderate price; also a good and healthy Stock of Fruit Trees of all descriptions, Forest Trees (particularly English Elms 9 to 12 feet high), Shrubs, and Evergreens of various sizes, well-grown plants, which will remove with safety from their being often transplanted.

NEW SEEDS.

MESSRS. SUTTON & SONS have the pleasure of intimating that they have now harvested and arranged for delivery all their new KITCHEN GARDEN SEEDS, consisting of all the most esteemed sorts in cultivation, among which the following are particularly recommended:—

Peas.
Fairbeard's Early Surprise
Sutton's Superb
Waite's Queen of Dwarfs
Cormack's Prince Albert
British Queen
Hay's Mammoth
Green's Superb
Shilling's Early Grotto
Thompson's Early Dwarf
And many other fine sorts.

Broccoli.
True Walcheren
Chappel's Large Cream
Sutton's Early White
Hammond's White Cape
Large German Cauliflower

True Beechwood and other Melons
Cuthill's Black Spine, Latter's Victory of England, and other Cucumbers
Fine new sort Bath Cos Lettuce
Adey's Large Cos Lettuce
Shilling's Queen Cabbage
Early Dutch Horn Carrot
Fine Long Surrey Carrot
Whyte's New Dark Beet
True Reading Onion
Seymour's Superb and Lion's Paw Celery
Soden's Early Oxford Potatoes
Swaine's Early Frame, Ash-leaf Kidney, and others.

And many others too numerous for insertion, any of which may be purchased at moderate prices separately, or more economically in collections as under:—

NEW KITCHEN GARDEN SEEDS.

		£	s.	d.
No. 1.	Complete Collection, consisting of 20 quarts of best kinds of Peas, and all other seeds in proportion, for one year's supply	3	10	0
No. 2.	Complete Collection, in smaller quantities	2	2	0
No. 3.	Ditto Ditto	1	1	0

Messrs. Sutton & Sons have the honour and privilege of referring to Gardeners and Gentlemen residing at the undermentioned places, who have annually availed themselves of this economical and advantageous mode of obtaining the best sorts of Garden Seeds, and have expressed themselves in the highest degree pleased with the crops; viz., at or near Glasgow, Perth, Edinburgh, Aberdeen, Castle Douglas, Berwick upon Tweed, Newport, Monmouth, Cardigan, Carlisle, Ludlow, Carmarthen, Gloucester, Hull, Newcastle-upon-Tyne, Bury St. Edmund's, Lynn, Wolverhampton, York, Bristol, Exeter, Brighton, Ventnor, Plymouth, Windsor, Bath, Newbury, Oxford, and many others, of whom the addresses may be had on application.

Early Orders are requested and recommended, as some sorts are in great demand.

Parcels delivered free to any office in London, or any Station of the Great Western Railway between London and Bristol.

Remittances are not required from known correspondents, nor from those who give satisfactory references.

Reading Nursery, Reading, Berks, Dec. 20.

GREAT YARMOUTH NURSERY, NORFOLK.

YOUELL and CO. beg to offer the following good and desirable plants to the notice of their Friends and Amateurs, feeling assured from their well known mode of executing all orders, that those favouring them with their commands will receive none but articles of the very best quality.

Superb new heavy-edged PURPLE PICOTEE, "BURROUGHES'S PRESIDENT," 15*s*. per pair. For particulars, see *Gard. Chron.* of 11th Oct.

Great Yarmouth Nursery, Dec. 20.

POTATOES FROM THE SCILLY ISLANDS.

W. E. RENDLE and CO. have been fortunate in procuring a few Tons of these POTATOES, *all of which are entirely free from the prevailing disease, and will be found most valuable for seed.* Refer to the Rev. C. A. John's Letter in the *Gardeners' Chronicle* Nov. 29, page 801.

*** Price on application.

Plymouth, Dec. 20, 1845.

THE TRUE FASTOLFF RASPBERRY.

GREAT YARMOUTH NURSERY. NORFOLK. 1845.

YOUELL & CO., being the parties who first introduced to the notice of the Horticultural world the above truly excellent Raspberry, unequalled for the size of its fruit and richness of flavour, and possessing an extensive Stock of fine Canes, beg to offer the same upon the following terms, guaranteed to be of the same quality as those they had the honour of supplying Her Most Gracious Majesty the Queen, His Grace the Duke of Northumberland, His Grace the Duke of Rutland, His Grace the Duke of Marlborough, the Earl of Harrington, the Earl of Liverpool, the Earl of Abergavenny, the Earl of Egremont, the Lord Bishop of London, Lord Viscount Lorton, Lord Sondes, and most of the Nobility, as well as the Horticultural Society of London, the latter having awarded Youell & Co. two prizes for it.

FINE STANDARD ROSES, by name, 15*s*. per dozen.

Great Yarmouth Nursery, Dec. 20.

CHARLES FARNES, Seedsman, 128, St. John's-street, London, respectfully informs his Friends and the Public generally, that he will be enabled to supply orders for the following new and choice VEGETABLE SEEDS:—

ROYAL GREEN MARROW PEA.—This most excellent Variety may be sown as a second early Pea, and will be fit for use about the same time as the Early Warwick: it will be found on trial that no Pea can surpass its flavour or rich colour when boiled. Price 2*s*. 6*d*. per quart.

QUEEN OF DWARF PEA.—It is superior to all the dwarf Peas known, and only requires more general cultivation to test its merits, when it will supersede every other variety of the same habit. Price 2*s*. 6*d*. per quart.

DANCER'S MONASTERY PEA.—This fine large Pea will be found superior to all the old sorts for a middle crop. It is an excellent bearer, and of good flavour, and merits a place in all gardens. Price 2*s*. 6*d*. per quart.

A general CATALOGUE of all the new Vegetables, &c., will be forwarded on application.—Dec. 20.

VICTORIA NURSERY, CORK.—FOREST TREES.

J. & H. HAYCROFT can deliver free at any of the undermentioned ports, strong transplanted LARCH, 2 to 3 feet high, at 15*s*. per 1000, and 3 to 4 feet high at 18*s*. per 1000; also small LARCH 9 to 15 inches high (fit for planting in clean ground) at 7*s*. 6*d*. per 1000. By steam-vessels to London in four days, to Liverpool, Bristol, and Plymouth, in 30 hours, and by sailing vessels to Newport, Cardiff, Neath, Swansea, and nearly every port in South Wales.

TO GERANIUM EXHIBITORS AND CULTIVATORS.

JAMES WHITE, Florist, Shacklewell, near London, having purchased the undermentioned Seedlings of Mr. R. Catleugh, has fine strong plants ready for delivery at the undermentioned prices:—"Clio," clear white purple spot, good shape, fine trusser, and fine show flower, very early and free bloomer, *H.* 10*s*. "La Polka," upper petals deep crimson purple, surrounded by a margin of rosy tint; under petals of an even rosy purple, close habit, and abundant bloomer, *H.* 10*s*. "Sunbeam," fine smooth orange, dark spot, good shape, fine trusser, and fine show flower, *H.* 1*s*. "Duke of Wellington," upper petals of a light crimson, surrounded with a dash of scarlet, under petals of a deep rosy pink, free bloomer, and good habit, *H.* 1*s*. They have all been successfully exhibited, and can be recommended. All the old-established varieties at the lowest prices.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s*. per dozen.—The importation of the above-named Bulb has just been received at A. Corbett's Italian and Foreign Warehouse, 16, Pall Mall. The Orange, Lemon, Citron, Lime, and Shaddock Trees, Catalonia, Agorian, and Arabian Jessamine Plants expected early in January.

SEEDS.—CORNER OF HALF-MOON-STREET

THOMAS GIBBS and CO.

(by Official Appointment) the SEEDSMEN to the "ROYAL AGRICULTURAL SOCIETY OF ENGLAND," Beg to remind the Members of the Society, and Agriculturists in general, that their only Counting House and Seed Warehouse is at the Corner of HALF-MOON-STREET, PICCADILLY, LONDON, as for the last Fifty Years.

Priced Lists of Agricultural Seeds are always ready, and may be had on application.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea. By special appointment to the Queen and H.R.H. Prince Albert.

PHEASANT POULTS.—Gentlemen stocking their preserves are respectfully informed they can be supplied with any quantity of TAME BRED AND WILD PHEASANTS, as above, also a great variety of useful and ornamental Water Fowl, Domestic Poultry, including Malay, Cochin China, Dorking, Spanish, &c., Fancy Bantams, &c., &c., 3, Half-moon-passage, Gracechurch-street.

TO NURSERYMEN, GLASS MANUFACTURERS, and OTHERS.—A person just commencing the Nursery Business is in want of the following as a beginning, delivered free in Liverpool, for cash :—

2000 squares of German Sheet Glass, not less than 20 oz. to the foot, say from 18 ins. to 2 feet long, and 10 or 12 wide, as may best cut. 2000 do., from 6½ to 8 ins., by 6½, good strong Crown do. 200 White and Red Currants. 200 Gooseberries, good sorts. 100 each Standard and Dwarf Cherries. 200 Dwarf Apples; 100 Standard do. 200 Dwarf Pears; 100 Standard do. 50 each Apricots, Nectarines, Peaches, maiden and trained. 200 Canes of the Red and White Antwerp Raspberries. 200 do. of Fastolff do. 50 good strong Vines, from 3 to 5 years old. Together with a general assortment of Stove and Greenhouse Plants, Flowers, Shrubs, and Forest Trees, and a general assortment of Seeds.—Direct to J. ORLTON, Frodsham, Cheshire, stating the lowest price for the whole or any part.

POTATO SEED.—Important to Gentlemen, Nurserymen, Seedsmen, and others.—A. HARDY and SONS, seed-growers, Maldon, and Bures, Essex, beg to offer their carefully selected POTATO SEED of 1844 and 1845 from the best early kinds extant, in pockets at 2s. 6d. each, with directions for sowing, &c., &c.: and their SEEDLING POTATOES, warranted free from disease, at 2s. 6d. per 100: also their very large and choice assortment of Vegetable and Annual Flower Seeds, wholesale and retail. A. H. & Sons strongly recommend early applications, as their stock is getting low. Town orders received by H. J. Hardy, Agent, 7, Windsor Place, City Road, where samples may be seen, and every information given.

FINE SUCCESSION PINES ON SALE.

TO BE SOLD, about 120 fine SUCCESSION PINES, principally of the sort known in Lancashire as the Black Jamaica. Also six or eight Providence in the lot. The Pines are of three sizes, and will be sold cheap; they are beautifully grown and warranted free from every insect that attacks the Pine. All applications to JOSEPH and CHARLES WHALLEY, Nurserymen and Seedsmen, South George Crescent, Liverpool, will be immediately responded to.

MR. GEORGE CORNWALL, MARKET GARDENER, Barnet, begs to recommend his New VICTORIA RASPBERRY to the notice of Gentlemen, and likewise Gardeners, as being the finest fruit and best flavoured Raspberry of any grown—it was sold in Covent-garden last season higher than any other; it is likewise a most abundant bearer, and grows 10 feet high. To be had at E. CHARLWOOD'S, Covent-garden; Messrs. W. and J. NOBLE, Fleet-street; of Mr. GEORGE CORNWALL, opposite the Red Lion, Barnet; and all the principal Seedsmen in London, at 3l. per 100, or 9s. per dozen.

BEE GLASSES, FISH GLOBES, FRENCH SHADES FOR FERNS, &c.

R. COGAN, GLASS, LEAD, and COLOUR WORKS, 48, LEICESTER SQUARE, LONDON.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & OTHERS.

BRITISH AND FOREIGN SHEET GLASS for Horticultural purposes, Sky-lights, &c., may be had at JAMES BROMLEY'S, 315, Oxford-street, London, at the Reduced Prices; also Microscopical Glass, French Shades, Plate and Crown Window-glass.

J. B. will be happy to furnish Lists of Prices, or any other particulars that may be required.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHUBCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to the inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their Manufactory.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire Work, &c. &c.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus; and B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices at 130 Fleet-street.

THE TANK SYSTEM.

BURBIDGE AND HEALY having heated a considerable number of Pits and other Horticultural Structures, for the cultivation of Pines, Melons, Cucumbers, and other tropical plants, particularly upon the plan recommended in Mr. MILLS's recent work on the Culture of Pines and Cucumbers, many of which are working at the present time, prove beyond a doubt that every kind of structure may be heated by BURBIDGE and HEALY's peculiar Tank Apparatus, with the absolute certainty of producing the desired result. Their Apparatus may be seen at work at the following places:—Horticultural Gardens, Chiswick; Royal Botanic Gardens, Kew; Baroness Rothschild's Gardens, Gunnersbury; Mr. Glendinning, Chiswick Nursery; Messrs. Henderson, Pine-apple-place; and in more than one hundred other places.—130, Fleet-street, London.

GYPSUM.—PURE GYPSUM (in fine powder), in 5-ton lots at 25s. per ton in the stream, or 27s. 6d. per ton landed. Also Guano (Peruvian and African), Superphosphate of Lime, Bones, Sulphuric Acid, and all other manures of known value, on Sale. By MARK FOTHERGILL, 40, Upper Thames-street, London.

GUANO (GENUINE PERUVIAN & BOLIVIAN,) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTHONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL;

And by their Agents,

COTSWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, AND CO., LIVERPOOL and BRISTOL.

47, Lime-street. Dec. 20.

THE URATE OF THE LONDON MANURE COMPANY, FOR TARES, TURNIPS, WHEAT, &c., at Four Guineas per Ton.—The above Manure having stood the test of many years' experience, is recommended with the greatest confidence; being uniform in its manufacture, it may be relied upon at all times, thereby preventing those great disappointments which frequently occur from the difficulty of obtaining Guano and other Manures in a pure state. It will be found most useful for Wheat on all soils, where it is requisite to procure a full plant early in the autumn. Full particulars and testimonials forwarded on application. The Company also supply genuine Peruvian and African Guano, Sulphuric Acid, Gypsum, and every artificial Manure, at the lowest market price, and warranted of the best quality.

40, New Bridge-st., Blackfriars. E. PURSER, Secretary.

LIEBIG'S WHEAT MANURE now ready for delivery.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also those for Distillers, Brewers, Soap Boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

DRAINING TILES.

AINSLIE'S PATENT IMPROVEMENTS.—For MAKING and DRYING Draining Tiles of the 1st CLASS. Gentlemen having works in operation, or who are about to erect them, will find the above worthy their attention.

The PROCESS combines EFFECT with ECONOMY, as Tiles can be made ready for BURNING at all seasons: generally from ten to thirty hours, according to the nature of the clay. To be seen at Alperton, Acton, Middlesex; Mr. HOWE, Engineer, 119, Great Guildford-st., Southwark; the Polytechnic Institution, Regent-street, London. Particulars may be had from JOHN AINSLIE, Alperton, Acton, Middlesex.

LIQUID MANURE.

METROPOLITAN SEWAGE MANURE COMPANY.

The Plans, Sections, and Books of Reference, in accordance with the Standing Orders, have been deposited, and the proper Notices given, so that the Company is now prepared to apply to Parliament in the ensuing session for an Act of Incorporation.

An early allotment of Shares will be made.

Applications for Shares and Prospectuses to be addressed to the Provisional Committee of the Metropolitan Sewage Manure Company, at No. 5, Berners-street, Oxford-street.

IMPROVED DIBBLING MACHINE.

JOHN WEATHERSTONE begs to inform the Agricultural Public that his PATENT HORSE-DIBBLING MACHINE is now ready, whereby the greatest regularity may be insured in the deposition of all Seeds. A team of four horses will be found sufficient power to draw one of the largest size.

Price of Machine, with six rows..... £35
" eight rows..... 40
" ten rows..... 45

Applications for further particulars may be made to Mr. JOHN WEATHERSTONE, Cassington, near Oxford; or to Messrs. JOHN and WARD, High-street, Oxford.—Agents wanted in all parts of the country.

THE FAILURE IN POTATO CROPS.

R. BENNETT'S IMPROVED ALEMBIC or POTATO STEAMER.—The disease in Potatoes so prevalent at the present time, has given rise to many inquiries and suggestions. But all agree that steaming is the best mode of cooking them, as according to the opinion of scientific men, heat at which steam is produced, destroys anything injurious they contain; and if the steamer is constructed so as to carry off the condensed steam instead of allowing it to fall back upon the Potatoes, the acid and unwholesome flavour complained of will be entirely removed.

R. B. feels great pleasure in recommending his Steamer as possessing all the above advantages, in addition to which it can be fitted to any saucepan or boiler, or condenser and receiver, attached to steamers at present in use. As all Potatoes are more or less affected, no family should be without an article possessing such great advantages at this lamentable season of failure in Potatoes.

Manufactured and sold wholesale and retail, by R. BENNETT, 22, Shoemaker Row, Doctor's Commons, London.

FENCING, GYMNASTIC, AND CALISTHENIC EXERCISES.

MR. J. CHIOSSO, Superintendent of the above branches of physical education at University College, London, begs to announce that his Academy, 21, Newman, corner of Gower-street, is open on Monday, Tuesday, and Thursday from 10 till 7 in the afternoon, and will be open every day during the Christmas Holidays. Exercises adapted for peculiar cases of Debility or Deformity will be attended to individually at convenient hours. Schools and private families attended. For terms apply at the Academy.

HEAL AND SON'S LIST OF BEDDING containing a full description of Weights, Sizes, and Prices, by which purchasers are enabled to judge the articles that are best suited to make a good set of Bedding. Sent free by post, on application to their Establishment, the largest in London exclusively for the manufacture and sale of Bedding (no bedsteads or other furniture being kept).—HEAL and Son, Feather Dressers and Bedding Manufacturers, 196, opposite the Chapel, Tottenham-court-road.

PHOSPHORIC RAT POISON.—This preparation is offered to the Public with the greatest confidence, being decidedly superior to all those poisons containing arsenic and other minerals. It is most greedily eaten by rats and mice as long as it is offered to them and invariably proves certain destruction. Prepared only by EDWARD PURSER, 40, New Bridge-street, London. Sold in pots, with full directions for use, at 4s., 8s., and 20s. each.

CHRISTMAS HOLIDAYS.

ROYAL POLYTECHNIC INSTITUTION.—The Lectures selected for this period of the year, by Dr. Ryan and Professor Bachhoffner, in CHEMISTRY and NATURAL PHILOSOPHY will be illustrated by interesting and Brilliant Experiments. A LECTURE on the PREVALENT DISEASE in POTATOES will be delivered by Dr. Ryan, and also on the ATMOSPHERIC RAILWAY, by Professor Bachhoffner, a Working Model of which, carrying several Persons, is exhibited daily. The additions of the OPAQUE MICROSCOPE, DISSOLVING VIEWS, and CHROMATROPE, are very effective. The PHYSIOSCOPE. Submarine Experiments by Means of the DIVER and DIVING BELL. Among the various additions to the Working Models is COLEMAN'S NEW AMERICAN LOCOMOTIVE ENGINE, for ascending and descending inclined Planes. A Magnificent COLLECTION of TROPICAL FRUITS. Mr. DOWNE, the celebrated Flute-player, will take part in the Music, conducted by Dr. Wallis. Open from Eleven to Half-past Five, and from Seven to Half-past Ten in the Evening.—Admittance, One Shilling. Schools, Half-price.

THE POPULAR REMEDY.

PARR'S LIFE PILLS.—The extraordinary success of this medicine is the wonder of the age; it has been tried by hundreds of thousands as an aperient, and has in every instance done good: it has never in the slightest degree impaired the most delicate constitution. Tens of thousands have testified that perseverance in the use of PARR'S LIFE PILLS will completely cure any disease, and are living witnesses of the benefit received from this invaluable medicine. Testimonials are received daily, and it would be impossible in a newspaper, to publish one-half received; and the following are selected as people well known in their respective neighbourhoods, and whose testimony is unquestionable. Further sheets of Testimonials and the "Life and Times of Old Parr" may be had gratis of all Agents.

The following important testimony to the efficacy of PARR'S LIFE PILLS has just been received by the Proprietors:—To Messrs. T. Roberts and Co., London. Athlone, Dec. 7, 1844. Sirs,—You will please to send me six dozen more PARR'S LIFE PILLS, I am just out. They are taking well, and, I can assure you, they are doing an immensity of good; everyone who has tried them in affections of the Liver and Stomach derives a great deal of benefit. Yours, &c., WILLIAM [illegible], Apothecary and Surgeon.

"Long Benton, near Newcastle, August 11, 1845. Sir,—I beg to thank, and inform you, of the wonderful cure PARR'S LIFE PILLS have effected in me. I was long subject to Shortness of Breath, with Cough, &c., but after taking your Pills a short time, I am not only cured but feel quite young again, and, although an old man of 60, I feel so much better that I think I shall live to be 90 at least. If you think this will be of service you are welcome to print it. Yours, with much respect, PETER MOFFAT."

Beware of spurious imitations of the above medicine. None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS ON A RED GROUND, engraved on the Government Stamp, pasted round each box; also the fac-simile of the Signature of the Proprietors, "T. ROBERTS and Co.," Crane-court, on the directions.

Sold in boxes, at 1s, 1½d., 2s. 9d., and family packets at 11s., by all respectable druggists and patent medicine retailers throughout the kingdom.

☞ Full directions are given with each box.

RANUNCULUSES.

HURST and M'MULLEN, SEEDSMEN & FLORISTS, 6, Leadenhall-street, London, beg to offer the following very splendid RANUNCULUSES for sale. As the Stock is limited early orders are requested.

All other kinds of SEEDS 30 per cent. lower than any house in London.—4, Eyre-street Hill, Hatton Garden.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 20, 1845.

MEETING FOR THE FOLLOWING WEEK.

WEDNESDAY, Dec. 24—Society of Arts . . . 8 P.M.

ALTHOUGH we regard the notion that the RACES OF PLANTS WEAR OUT as utterly baseless and visionary, we are by no means opposed to certain conclusions at which writers adopting that erroneous hypothesis have arrived. We admit that their statements are in many instances correct; we have nothing to offer in the way of objection to their experiments; it is only against their false reasoning that we are obliged to protest.

Mr. KNIGHT found that diseased Apple trees produced diseased descendants, and that the evil of the parents went onwards to their children from generation to generation: and therefore he concluded that the Apple trees were dying of old age. A writer of elaborate articles in the *Morning Herald*, Mr. TOWNLEY, infers because the Gooseberry growers of Lancashire find the weight of their fruit diminishes "after the varieties have been cultivated some time," that therefore these varieties are dying of old age, and he has expended no inconsiderable quantity of learning in attempting to fit this speculation to the Potato. So impressed, indeed, is he with a conviction of its truth, that he recommends people to be sent to Peru, or wherever else the Potato grows wild, in order to get seeds and tubers of vigorous wild plants. And all this is imitated by a shoal of persons who catch up the idea, and forthwith write letters to newspapers, or men in office, or rush into pamphlets with all the complacency which invariably attends an ignorance of facts, or even of sound principles. When we read these things, we cannot but exclaim with the old satirist

Hos pueris monitus patres infundere lippos
Cum videas, querisne, *unde* hæc sartago loquendi
Venerit in linguas?

Whence indeed?

It is very singular that not one of all those writers who have of late been fatiguing the public eye should have perceived that the very few facts on which they rely are susceptible of a much more simple interpretation than that given by Mr. KNIGHT, and caught up by themselves. It is marvellous that they should have imagined that the common sense, to say nothing of the science, of the intelligent cultivators of the present day, should accept for truth such an extraordinary exhibition of false reasoning. One would think that all death or disease was exclusively the consequence of old age.

It has been well known from all antiquity that if vigorous children spring from vigorous parents, so also is a diseased and debilitated progeny the sure issue of parents weak in body and mind. Among men this is notorious. The obvious interpretation of the Apple tree and Gooseberry bush cases, which have so perplexed the minds of the little patriots of our day is this; a tree is allowed, from some cause or other, to become unhealthy; a piece cut from it and put upon another tree carries its disease with it; when again divided, the disease is again propagated; and this will go on so long as the unhealthy plants remain exposed to the circumstances which originally caused their bad health. But change those circumstances, place the plants in more favourable circumstances, keep off the cause of the evil, and the evil will gradually disappear, as has actually happened in the instances mentioned last week, which are a conclusive answer to the whole wearing out hypothesis.

These were the just views of Mr. GARDEN, of Glenae, to which we alluded last week. "We may for a time," says this gentleman, "raise species of DISEASED plants, and employ these as the seed (sets) of the next crop. Nothing can be more manifest than that the offspring of diseased parents will participate in their disease, and even be incapable of cure, or of becoming the seed of a healthful crop on any soil. * * It is evident that diseased plants may be more easily cultivated on a healthful and fresh soil than on one which is diseased and run out. * * But the *abundance* and *healthfulness* of the crop are two very different things. It is well ascertained that seed Potatoes (sets) taken from fields on the higher grounds, and where Potatoes have been much seldomer cultivated, are less liable to fail than those raised on fields which have produced *many* Potato crops. * * The latter *forced* in diseased or exhausted fields are unfit for seed (sets) in any situation."

Nothing can be more true. The health of the Potato crop is not with any certainty to be increased by raising new varieties from seeds. The result of that operation may be better or worse according to the health or constitutional peculiarity of the individual from which the seeds were gathered, or according to the way in which those mysterious influences which cause constitutional difference operate while the young seedling is passing through the processes of organisation. We all know that some seedlings are tall, others dwarf, some early, others late, some robust, others delicate, some extraordinarily rich in starch (as, for example, the famous Rohan sort), others deficient in that product; and we can never tell beforehand, with any certainty, what peculiarities a given seedling will possess. The idea, therefore, of renovating the Potato crops of Europe by raising them from seed is a dream.

What is really wanted, and what *must* be better attended to, is the renovation of the crop by a skilful cultivation of the Potatoes we already have. We do not mean that general cropping demands much alteration, for that we believe to be in a satisfactory state, now that autumn-planting has been hit upon. What is very bad is the total want of all care in procuring good, healthy, vigorous sets. As the case now stands a man gathers his Potatoes into heaps, keeps them there all winter, allows them to commence growing in the spring, then uncovers them, rubs off their sprouts, lets them dry, cuts them into sets, and finally after six months of unnatural treatment commits them to the soil. He thus plants the germs of disease; and although we have no reason whatever to connect this practice with the late murrain, yet it is impossible to doubt that such a treatment, long persevered in, must have a tendency to diminish the constitutional vigour of the crop.

Fortes creantur fortibus et bonis.—In no department of nature is this more true than among plants. A Potato, forced in rich land, nursed in a warm valley, and unnaturally expanded into a monster of its kind by high and debilitating manure, becomes well suited to the table, but has an uncompacted tissue, and a feeble constitution. A small matter makes it ill. Its unhealthiness is communicated to its successors, and so the evil is ceaselessly augmented. On the other hand a Potato, raised in poor or rocky ground, small and compact, thoroughly organised by the action of healthy foliage operating upon a small surface, will not answer indeed the purpose of the grower of a crop, but is admirably adapted for his sets. It is not in itself marketable, but it forms the best of seed. Thus it was that the small green stem-Potatoes, which high cultivation has almost driven out of recollection, always proved the best of all for sets, though utterly uneatable and useless for the table.

What we, then, would advise growers to do, is not to indulge in a vain hope that seedling Potatoes will be any better than what they now have; but to adopt the practice of raising Potatoes for sets upon a different principle from those which are for the table. To treat the latter as they now do; but to grow the former in poor, light land, where there shall be no excessively rapid growth, and no great produce; but where a small, compact Potato, thoroughly ripened, thoroughly organised, and therefore thoroughly healthy, will be a guarantee that all the freedom from disease, which in the nature of things is to be expected, shall be secured for the crop it is to furnish beyond all chance of risk.

If such Potatoes are left in the ground all the winter undug; or are planted in the autumn; or, if taken up, are thoroughly greened, and packed in sand, and planted before sprouting, a far more rational means of renovating the Potato crop will be adopted than running to Peru for seed not half so good as our own.

WE observe that his Excellency the Lord Lieutenant of Ireland has placed 500*l.* at the disposal of the ROYAL IRISH AGRICULTURAL IMPROVEMENT SOCIETY, to be expended by them in such a way as they may deem most expedient, with reference to the operation of thorough draining.

We cannot allow this circumstance to escape without offering our humble testimony to the excellent management of this Institution; and we regard the assistance thus rendered far more valuable as an acknowledgment, by Lord HEYTESBURY, of the national value of a most admirable working body, than for its pecuniary amount. We have had means of seeing how the Irish Agricultural Society is managed, how its funds are expended, and how its business is transacted by its indefatigable secretary, Mr. BULLEN; and we should regard it as a dereliction of public duty if we did not use the opportunity now afforded us of expressing our opinion, that no association of individuals, to work out a great public good, has ever been formed upon better principles, or with a more entire absence of all personal objects.

The accounts of the Society for 1844 show that, with an ordinary income of 1501*l.*, they actually awarded 1526*l.* in premiums; the whole of their other expenses being defrayed by the interest of a small capital invested in the funds, and by the profits upon their annual cattle show. They have local farming societies in constant correspondence with them in every district of Ireland, and through these Societies prizes are offered for various objects, while information is collected or dispersed with a rapidity and certainty that are admirable.

It is impossible that such a Society, if its present excellent system of management is persevered in, should not be productive of the greatest benefit to Ireland; and we cannot but again express our satisfaction that the Irish Government should have thus significantly expressed its entire approbation of their proceedings.

OF all the vermin that infest gardens, WATER-RATS are the most mischievous in low situations, where ditches or ponds are numerous. They feed on the roots of trees, and we have known them do incredible mischief in the course of a hard winter. On one occasion, Hollies of large size were observed as the spring advanced, to grow pale, and shrivel, and put on the unmistakeable symptoms of death from no apparent cause. At last a high wind threw them on their sides, and then it was discovered that their roots had been so entirely devoured, that only the stump of the main stem remained, and that was cut by the creatures to a smooth surface, as if it had been operated upon by a keen-edged gouge. The rats had made a gallery from a neighbouring ditch to the roots of the Hollies, and there had formed a chamber in the dry bank, roomy and warm. In another instance, a long Whitethorn hedge, of vigorous growth and some years old, placed near the edge of a ditch, was so entirely cut through below the ground level, that every plant could be pulled up by the hand. In short, the destructive habits of these little animals are notorious, and most inconvenient.

Some time since (p. 489, 1844), we published a statement by Dr. URE that water-rats could be certainly poisoned by phosphorus. The method of using it having been also given, a friend of ours made an experiment with it. A ball of the preparation, as large as a pigeon's egg, was placed in each hole, as far within the mouth as it could be introduced by the hand. In a short time the rats disappeared. Whether they perished, or whether they merely took to their heels; whether phosphorus pills are unsuited to a rat's stomach, or whether these creatures were terrified by the unwonted phosphoric gleams that illuminated their galleries, we do not know: but it is certain that they went away.

After a few months, however, they returned in very small numbers, and we hear that they are again taking possession of the ground. But the owner of the premises has no one to blame on that account except himself. He should have kept off the marauders as soon as their long trails among his Duckweed indicated their presence. Had he repeated the dose, he would have been rid of the second colony as he was of the first: and so convinced is he of the value of phosphorus, that we know him to have now ordered a supply of the phosphorus pills advertised in our columns by Mr. PURSER.

For the convenience of those who prefer making the material for themselves, we reprint Dr. URE's directions.

Melt hogs'-lard in a bottle plunged in water heated to about 150 deg. Fah.; introduce into it half-an-ounce of phosphorus for every pound of lard; then add a pint of proof-spirit, or whisky; cork the bottle firmly after its contents have been heated to 150 deg., taking it at the same time out of the water-bath, and agitate smartly till the phosphorus becomes uniformly diffused, forming a milky-looking liquid. This mixture being cooled, with occasional agitation at first, will afford a white compound of phosphorus and lard, from which the spirit spontaneously separates, and may be poured off to be used

again, for none of it enters into the combination; but it merely serves to comminute the phosphorus, and to diffuse it in very fine particles through the lard. This fatty compound, on being warmed very gently, may be poured out into a mixture of Wheat-flour and sugar incorporated therewith, and then flavoured with oil of Rhodium, or not, at pleasure. The flavour may be varied with oil of aniseed, &c.

THE AMATEUR GARDENER.

Preserving Plants in Winter.—Nothing has more discouraged the cultivation of flowers than the supposed difficulty of preserving them in winter; and as this apparently formidable obstacle disappears as the amateur acquires experience, I shall endeavour to detail some of the methods I have employed, and their successful results. Of course, my remarks are intended for those who garden on a small scale, and who have not greenhouses for winter protection. At the same time, the principles of the treatment about to be described will apply to the largest collections, and may be of service to all whose object is to secure the beauties of the spring and summer from the desolations of winter.

Those whose stock of flowers consists of a few greenhouse plants, which they have cultivated in windows, have a very easy task to perform in protecting their favourites, as far as frost is concerned; for a very small amount of care will suffice when the plants are in a dwelling-house. The temperature of an occupied sitting-room will always be sufficiently high to keep out the frost in the day time, even if the plants are close to the light, and they may easily be removed in the evening to that side of the apartment which is furthest from the window. If the amateur has a large number of plants (young Pelargoniums, for instance) arranged on shelves close to the window, to remove these would be troublesome, and they may therefore be allowed to remain in their places in ordinary frosty weather, the precaution being taken to interpose the blind between them and the window. I once preserved 200 plants in good health through a severe season, in a room having only one large window, which admitted a good deal of sun. Some of the pots (which were all small 60s) were placed on narrow shelves, ascending to the top of the window, and as near the glass as possible; the others were set on a table. An Arnott stove was lit when required either by very damp or very cold weather; air was given as often as possible; the whole collection was often moved, that light might be equally dispensed, and advantage was taken of mild rains. I succeeded in preserving the whole, without any sickly growth being developed, and was rewarded by having an abundance of strong plants for bedding out in the spring. Most of these were Pelargoniums.

Many plants may be more summarily dealt with. Cactuses and Scarlet Pelargoniums will do well in any dry cellar, provided no water is given them. The latter when taken up from the flower-garden, I have preserved by shaking off the soil, and hanging them, root upwards, in a shed or coach-house from which frost could be excluded. In the spring they were found in full possession of their vital powers, and on being trimmed and potted, made handsome plants. In all the cases to which I have alluded it will be seen that care and forethought are the requisites demanded of the amateur. Attention must not be remitted for a day. I have always found that more plants are lost in the winter by damp than by frost. Much water, therefore, must not be given; indeed it should be altogether withheld so long as the plants do not flag. A plant in a moist growing state will yield easily to frost, while, if it had been kept dry and dormant, its powers of resistance would have been great.

But no plan of preserving plants from frost, independent of a greenhouse, is equal to a well-regulated pit or frame in the open air. I have tried this in various ways and always found it succeed if properly attended to. At the present time all my plants, intended to be put into the borders next year, or brought into the house, are in a large two-light frame, the management of which I will endeavour to describe. The frame stands about 2 feet from the ground, sheltered by a south wall, on an exhausted hot-bed, on which Cucumbers were grown in the spring. The mould of this bed having been kept from rain in the early autumn, at the close of October the pots were sunk into it up to the rims. A double light was then put on, by which wet and frost are more effectually excluded, and at the present time, Dec. 16th, the soil around the pots is quite dry. Around the frame long stable dung is piled up about 18 inches in width, and level with the top. Over the whole, an old carpet is thrown when necessary, and I have no apprehension that I shall lose anything if damp does not defeat my efforts. Every day when it is not frosty, air must be freely admitted, and dead or mildewed leaves must be carefully removed. When frost sets in, two or three extra mats may be laid on, and the whole kept on till a thaw takes place. On no account remove the coverings until at least a day after the frost is gone. This is a very important rule, for the admission of light may be fatal if any of the leaves should be frozen. In this way I have preserved Pelargoniums, Calceolarias, Verbenas, Hydrangeas, &c.; and the freshness of the whole collection after the winter has passed away has always been encouraging. Ordinary greenhouse plants may therefore be preserved by every one during the hardest winter. With reference to tender plants in the open air, my observations on the treatment adapted to defend them must be deferred until another opportunity.—*H. B.*

THE BEURRÉ DIEL.

Synonymes.—Poire des Trois Tours, Diel, Diel's Butterbirne, Dorothée Royale, Grosse Dorothée, Beurré Royal, Grosse Dillen, Dillen, De Melon, Melon de Kops, Mabille, Beurré Magnifique, Beurré Incomparable, Fourcroy Bouvier; Beurré d'Yelle, Beurré Spence (of some).

This Pear, possessing the most noble appearance, is said to have been raised by Dr. Van Mons, of Louvain, in 1805. At all events it was named by him in honour of Dr. Augustus Friedrich Adrien Diel, of Nassau Dietz, one of the best Pomologists, not excepting the celebrated Du Hamel. Its primitive name is, however, stated to have been that of the Poire des Trois Tours, from the Chateau des Trois Tours, where the original tree stood; a statement which throws considerable doubt as to whether it was actually raised by Van Mons, or whether it had been obtained for his collection of varieties not raised by himself. Nor is it certain whether this is the identical variety which Van Mons named the Beurré Spence, and which he said was the best of all Pears. The Beurré Spence was, of course, eagerly sought after; and it has been a subject of inquiry for the last 25 years, but no distinct variety has yet been ascertained; under that name Beurré de Capiaumont, Beurré Diel, Beurré de Mons, and Urbaniste, have been fruited, and in some instances the Beurré Diel was received direct from Van Mons' collection under the name of Beurré Spence.

The fruit from a wall is often much larger than the accompanying representation, and frequently quite as large from vigorous standards. Flesh, yellowish white, a little gritty near the core, melting, buttery, with a rich aromatic, sugary flavour. In perfection between the end of October and beginning of December, succeeding the Marie Louise, and preceeding the Glout Morceau. The tree is a very strong grower, and bears most abundantly in any situation; the best flavoured fruit being from standards or dwarfs, the latter are most to be recommended, because the fruit, being heavy, is apt to be blown down prematurely from high standards. The shoots are somewhat pubescent, of a dull olive brown, sprinkled with a few small linear specks. Leaves large, roundish-ovate, acuminate, nearly flat, slightly pubescent beneath, irregularly toothed on the margin. Flowers large, petals roundish-oval imbricated; stamens strong, with large anthers.

The tree, owing to the great breadth of its foliage, requires to be well thinned in pruning. In periods of several successive warm summers the fruit was highly esteemed. I am aware it has lost much of its former reputation in recent cold seasons; but its cultivation ought to be pursued. If it should prove gritty from old standards, let them be headed back, or young trees will soon grow up from which the fruit is usually more melting, though perhaps less sugary. If it can only be obtained in full perfection, its rich cinnamon flavour will afford general satisfaction.—*R. T.*

NOTES ON A COLLECTION OF WOODS.

Some years ago I devoted much attention to the collection of specimens of every British species of wood that I was able to procure, together with others from trees introduced into England; and I have now in my possession a nearly perfect set. There is in Sir Hans Sloane's collection (I believe) in the British Museum, a collection of above 800 square pieces of the woods of different parts of the world, neatly arranged in the drawers of small chests; but I object to the specimens being all cut square without any regard to the grain of the wood; and I have adopted the plan of cutting the wood from a bough or stem, if a small tree, or shrub, on which I left the bark, and directed the carpenter to plane it obliquely at one end, and straight across at the other, so as to stand conveniently, a second specimen of each piece being made to present a longitudinal section of the wood; the surfaces were then all varnished to exhibit the grain as nearly as possible in perfection. It is true that specimens from the boughs present the characters of the wood in miniature when compared with pieces from the trunk; but this disadvantage is small, and compensated for by the convenience with which it is otherwise attended.

In all ordinary wood or timber work, we are so little accustomed to be shown the true features of the structure of the wood, that under the treatment I have described, almost every specimen discloses elegant lines, indented circles, and many an ornamental touch of a beauty little expected in so unlikely a material. Among the most beautiful are the Furze, Laburnum, and Phillyrœa.

Among the facts generally known respecting this subject is the existence of distinctly marked concentric rings, surrounding the pith as a centre to the bark, each of which represents the space of one year of the tree's existence, though it is said that a sudden check to vegetation by cold winds during the summer will have the effect of producing a second fresh ring for that season; but in this case the additional one is so faint as to be readily distinguished from those caused by a winter's rest. As a warm genial season promotes a rapid increase of vegetation, it follows, of course, that more wood will be formed during a favourable than a cloudy, cheerless summer, and hence the inequalities in the thickness of the rings of trees; thence, indeed, might be deduced a sort of calendar of seasons, a narrow ring recording a cold, a wide one a warm summer. When the pith is not in the centre of the wood, it is that part which faced the south, or which was most exposed to the light, which is most developed.

Besides the annual concentric rings, most woods exhibit a number of whitish lines, formed not of fibres but of cellular tissue, radiating from the pith to the circumference, and which are termed medullary rays. I would request especial attention to these, because I conceive that an examination of them will generally afford at a glance an idea of the relative strength and tenacity of the wood. Whenever wood splits, it is almost invariably through the comparatively weak line of a medullary ray, which is abundantly testified to my view by the yawning gaps in those of my specimens which are strongly marked with rays. If, therefore, a species of wood is free from these lines it may safely be inferred that it is possessed of superior tenacity. It is one of my chief objects in this paper to furnish from my collection lists of those woods in which either the concentric zones, or the medullary rays are most conspicuous, with another list of those in which both are marked, and which are usually most adapted to ornamental purposes.

Between the two British species of Oak (Quercus pedunculata and Q. sessiliflora) the former of which is by far the most common, there is a remarkable difference of structure; Q. pedunculata (the Oak whose Acorns are stalked) being decisively marked with medullary rays, and hence liable to fracture; Q. sessiliflora, so free from them, and so clearly marked with annual rings alone, as to be called by carpenters "Chesnut Oak," in allusion to the character in the Spanish Chesnut. As the superiority, in point of weight, also rests with the latter, it appears to me to be beyond doubt that it should be acknowledged and planted as the true, that is, the most substantial and durable naval Oak. Observations on the "Botany of Sussex," by Mr. T. H. Cooper, fully carry out this opinion by numerous interesting observations. It is well known that the wood of the Cork Oak (Q. Suber) is

nearly worthless; and why? because its medullary rays are of the greatest breadth, dividing, for instance, a circular piece in my collection, 5 inches in diameter, into 70 distinct sectors.

In the following woods the annual rings predominate; sessile-fruited Oak; Mountain-Ash; Service; Lime, which owes its suitability for ornamental moulding to this quality combined with its lightness; Alder, Horse-Chesnut and Birch. All trees of the Fir tribe (Coniferæ), Willow, which from its extreme lightness, and the absence of medullary rays, is so well adapted to works subjected to concussion, as cricket-bats, &c. In Apple and Pear, the rings are indistinct; in Yew and Spanish Chesnut, there is not the least appearance of medullary rays; Acacia and Phillyræa, very handsome indeed, especially the latter, which is cream-coloured, profusely marked with white dots; Lilac, Walnut, Sumach, a deep brown glossy wood; Camellia japonica, which, like other hothouse shrubs, has even regular rings.

The following have the medullary rays conspicuous: Cork Oak and Hazel have them decidedly marked; common Oak less so. In Plum, Blackthorn, Cherry, Alder and Holly, they are abundantly and delicately traced; Beech and Ivy have them at irregular intervals; the former presents a handsome section. In the Vine and Clematis vitalba, the rays are broad, the wood very porous; black and red Currant, very spongy woods; Dog-wood has wavy rays; the cause, perhaps, of that toughness, for which it is always used in making butcher's skewers. Mistletoe has no appearance of annual rings. Both the medullary rays, and the annual zones are exhibited in these. Box, rays fine and rings very close; Hawthorn, Laurel, Elm, Ash, Damson, Plum, Hornbeam, and Peach, have numerous delicate rays with distinct rings. Both the common and the dwarf Furze are beautiful woods, richly variegated with white and grey dots. Sycamore, which is sonorous, and best adapted of British woods to the construction of the stethoscope. Gooseberry, wild Cherry, and Laburnum, are handsome woods; Mulberry, Maple, and Rose.

I offer this list, which I have drawn up with careful observation, rather with the hope that practical uses may be derived from it, than with the present view of pointing out all its utility; and I trust that a comparison of the known qualities of particular woods, with the characters here specified, will tend to particularise certain rules which have hitherto stood as generalities—one of the constant aims of science. I once entertained an idea that it was possible to arrive at rules for ascertaining the age of a tree from the simple datum of its circumference, and an arithmetical rule; and took the trouble to make numerous observations on the annual increase of different trees; but I noticed so much irregularity attending the rate of increase of individuals of the same species, arising firstly, from soil and situation; and, secondly, from a diminished rate of growth at advancing periods, that it was impossible to arrive at anything like an accurate result. I found, for instance, the annual rings of the Elm to vary between $1\frac{1}{2}$ line, and $2\frac{4}{5}$ lines per annum; the Oak from $1\frac{1}{6}$ to $2\frac{3}{4}$, and so on with the rest. It is evident that an average between such widely different results as these would not prove satisfactory even when allowance should be made for the nature of the situation in which the tree grew. Again, after the first 50 years, a tree adds less to its girth the next 50 years and so on continually, until, when arrived at its full maturity, it ceases growing, and the diminished vigour with which it puts forth its foliage points out the sinking of its vital powers. In such a condition it is evident that no records the tree possesses in itself, will serve to chronicle its true age.—*F. A. Malleson, Pulborough.*

WINTER FLOWERS.

The Cactus Family.—These showy flowers, although not usually seen in bloom during the dull winter months, nevertheless possess very considerable capabilities for that purpose, provided room can be made, and special treatment afforded them at proper periods.

Like most other tribes adapted for forcing, in the strict sense of the term, early growth, with a corresponding early rest are the only principles by which we can expect success. To accomplish this with the Cactus family, a pit or other close structure should be appropriated to them, as early as the middle of January in the spring previous to the forcing period. Having received a decided rest or cessation from growth for three months previous, they may readily be excited into growth with a lively temperature of 70° by day, and from 55° to 60° by night; more especially if a bottom-heat of from 75° to 80° can be afforded.

The refuse wood should be pruned away previous to this, and the main shoots placed in proper order. Nothing more is wanted to carry out and do justice to the plan than a very light roof; this is indispensable, and the glass should therefore be previously well washed.

The constant use of clear liquid manure for a month or two whilst the plants are making their wood, will be of great service; for, like the Pine-apple, rapid growth is everything for a while. They enjoy while in this stage a tolerably moist atmosphere, especially at night; but equally enjoy a free circulation of air through the day, accompanied with very high temperature during sunshine; with the thermometer ranging to 90°, or even 95° in such cases.

By the early part of May they will have made sufficient growth, and should be withdrawn from all excitement of bottom heat and atmospheric moisture, and placed on the back shelf of any very light and warm house. The liquid manure should now be withheld, and very moderate watering, with clean water, substituted.

They may remain here until Midsummer, when about the beginning of July they should be removed to a sunny and somewhat sheltered situation out of doors, and there remain, very sparingly watering them until the end of September, when they may be removed to a cool greenhouse, and thence progressively introduced to the forcing pit, where a temperature of 70° will be necessary, with abundance of light.

They must still be rather sparingly watered, until the blossom buds are of the most decided character, when, if size be an object, weak liquid manure may be again resumed. All shoots made after midsummer should be disbudded, and the terminal bud of all the principal young wood destroyed with the thumb nail about that period. These plants to force early should be always what gardeners term "pot bound."

The best soil for them is composed of one part chopped turf, if from a roadside all the better, and the other part coarse leaf mould, sandy heath soil, coarse bone, waste coarse charcoal, and lime rubbish: these materials should be rough, and the best of drainage secured in the pots. They will, however, grow well in chopped roadside turf alone, in a fresh state.

Lachenalias.—This interesting little family, especially L. tricolor, is of very easy culture, and when well blossomed, has much the appearance of a pot of cowslips. If the roots are potted and set to work early in autumn they will be in blossom by the first week in January, provided a shelf near the glass in a warm stove can be provided for them. They delight, however, in a bottom heat, and should, like most other bulbs, be most sparingly watered for some time after emerging from a rest state. I have some this season placed on a hot water pipe by way of experiment, and kept almost without water, which are doing extremely well: there is no occasion, however, for this extreme.

When their leaves turn yellow in March or April, water should be entirely withheld, and when decayed the pots may be placed under any dry arches in houses, or laid upon their side at the back of a wall until the end of August, when they must be taken out of their pots and sorted, the largest planted five in a five-inch pot, and the rest thinly in store pots for the year ensuing. Soil: equal parts of sound loam, sandy peat, rough leaf mould, and sharp sand.—*R. Errington, Oulton.*

PICOTEES AND CARNATIONS.

As many most beautiful Picotees and Carnations have made their appearance during the last two or three years, and as most of them have come under my observation, I venture to offer the following remarks made during the blooming season. Carnations usually take precedence at exhibitions, but I will devote the first part of my paper to Picotees, as they are generally more highly esteemed by the many. Some few years ago the class of yellow Picotees was composed entirely of flowers which now would be considered sad frights, more like Ragged Robins (Lychnis Flos-cuculi), in the deep serrature of their petals, than anything else; and whilst rapid improvements were making in the other varieties, this class was comparatively neglected. Martin's Queen Victoria was the greatest advance, having a very fair yellow ground, with an almost unexceptionable petal, laced with crimson. Fox's Beauty of Miltown is a fine and attractive flower, though, unfortunately, serrated; still, its fine colour, size, &c., cause it to have many admirers. But, perhaps, one of the handsomest is Barraud's Euphemia, which has a fine pod and petal, of good form, with a violet-purple lace, or feather, on a rather deep yellow ground colour. Very fine varieties, but not in general cultivation, are Hoyle's Topaz, Barraud's Favourite, and Brooks's Aristides.

When prizes are more generally given at floricultural exhibitions for yellow Picotees, there will undoubtedly be more attention bestowed by florists in the seeding and fertilisation of their flowers. Formerly the varieties cultivated were tender, and difficult to keep, but those lately raised (as noticed above) in this country appear to have more robust constitutions, and will become general favourites. Proceeding to the rose-edged class, I would observe that, singular enough, when seedlings of this description were raised in some parts of the country, they were discarded as comparatively worthless, though in the neighbourhood of the metropolis their beauty has always been appreciated, and from thence I first had that fine, heavy-edged variety, Green's Queen Victoria, a flower possessing a striking contour, having petals enough to make a full and noble flower, rising tier above tier in most beautiful style. Yet, however high an opinion I may entertain of the Queen, the Princess Royal (Wilmer's), a variety of more recent date, must, I think, take precedence. The petals are so very fine, the white pure, and the broad lacing of rosy salmon, is less disposed to bar or strike down, than in the previous sort; it is, indeed, an admirable flower. Occasionally it is called Lovegrove's No. 5, but the former designation appears to be in most general use.

In addition to the above two first-rate sorts, I have seen a seedling this season raised by a most enthusiastic and first-rate cultivator near Leeds, which ranks very close, if not equal, to the preceding. It is styled "Proconsul," and is a large bold flower possessing the requisites of a first-rate variety in an eminent degree.

Wilson's Fanny Irby must not be forgotten; this is a good and useful sort, fine petal, and of good size. The margin is rather paler than the above sorts, and it is likewise an older flower: still it is a general favourite. Twitchett's Fair Rosamond I have grown, but perhaps my expectations had been raised too high; with me it striped too much, and certainly last year did not realise my anticipations. Wilmer's Agnes is of fine form and petal, not very heavily edged; in fact it is one of the intermediate varieties, though rather inclining to this class; it often comes with a slight bar about the eighth of an inch in the centre of each petal, but is a most pleasing variety. Ely's King of Roses is not so good as many of his flowers are, the margin is too much like some of the striped Picotees shown in Lancashire a few years past, having a "scratchy" appearance (if I may so term it), and, consequently, is but second-rate. Trude's Queen Victoria is immeasurably inferior to Green's, and though a large and bold flower, will not do, as the petals are too rough to be now tolerated. Amongst other varieties worth adding to collections, I may mention Sykes's Eliza, Kirtland's Mr. Annesley, and Gidden's Miss Desbro, forming with those above described (the two latter ones excepted) the cream of the sorts now out.

Light-edged Rose Picotees are generally delicate and beautiful flowers. Gidden's Beauty of Hemmingford and Vere's Belle of the Village being two of the older favourites. I well recollect receiving a description of Wain's Queen Victoria from a first-rate amateur with whom it bloomed the first year after letting out. He was, and I believe now is, a most successful cultivator; and he wrote me that on its blooming he was so enraptured with it, that he could hardly tolerate any other Picotee in his garden. When bloomed well, it certainly deserves very high encomiums; the white is good; the margins smooth, and the colour laid on delicately and truly; but it is a sort that requires most careful watching during expansion, and assistance as it blooms; for it is more apt to come with confused and ill-arranged petals than any other sort with which I am acquainted. Those who flower Wain's Queen Victoria well, may certainly take their stand as good florists. I have this season seen it in very fine character, but even then it was not equal to that pre-eminent variety—Barnard's Mrs. Barnard. This is one of the most beautiful and attractive sorts grown, having fine broad, smooth, and wax-like petals, delicately margined with rosy-salmon; its pod and habit is likewise good, and no one who makes any pretension to a good collection ought to be without this chaste and lovely flower. Unfortunately it is not plentiful, and its quality may be inferred from the high price it bears, and that price increasing.

Garrett's Lady Dacre is another first-rate flower, though I give the decided preference to Mrs. Barnard; and Wood's Marcus is an old sort with an ugly pod, but fine petal, and can only now be called second-rate.

Crouche's Ivanhoe is also a delicate and finely-coloured flower, of good form, and will be extensively grown; and though I have not yet bloomed Dickson's Sophia, I am given to understand that it will run the established favourites hard. I shall close this notice by observing that in this class, Gidden's Diana and Brooks' Miss Brooks are not to be despised, which, with Barraud's Bride and Portia I bloomed this season very prettily; and all four may be very safely added to collections, certain of increasing their efficiency.—*W.*

Home Correspondence.

Wearing out of Races.—I have two old Apple trees, and have endeavoured to continue them by grafting. The new trees have in every instance had the marks of old trees, and would not grow but as old trees do, with dead branches to be removed continually, year after year. None of these young trees are of the least use to me. One of the old trees is, I believe, the Juneating, the other an excellent large baking Apple, but I do not know its name. Potatoes, when the sorts get old, are discarded in this neighbourhood. The Strawberry, when it becomes old, will not produce its fruit as when young. This is the case in my garden, and I have been obliged to give up a favourite kind, after every care with it. The Abele or White Poplar bears marks of old age in young trees. Let grafts be taken from very old Oak trees, and could you have such confidence in them that you would raise a plantation by grafting them on young stocks? There is a very old Oak tree near Shrewsbury into which it is said Owen Glendower climbed to see the battle of Shrewsbury. This would be a good one from which to make such an experiment as I have mentioned. I have not the least confidence that it would succeed.—*C. A. A. Lloyd, Whittington, Oswestry.* [We would represent to our correspondent that this is answered in a Leading article of to-day.]

Quercus sessiliflora.—A great deal has been said respecting the relative value of our two indigenous species of Oak, Quercus sessiliflora and Q. pedunculata; and generally speaking, it appears to be satisfactorily proved, that the wood of Q. sessiliflora is more durable and more valuable than that of Q. pedunculata, but there are two points connected with the subject which require further investigation; first, the relative qualities of the different varieties or races of each species; and second, the relative pecuniary advantage to the planter of each species. The different varieties of each of the two Oaks often appear to differ full as much or more from each other in point of luxuriance of growth, and perhaps even in the quality of the timber, than the species, and as probably these varieties are generally owing to local circumstances, such as soil, climate, &c., they would be permanent only under those circumstances which gave rise to them, and might degenerate if

transplanted to other localities less favourable. It might thus turn out, that in one part of the country the Q. sessiliflora may be the most advantageous, whilst in others the Q pedunculata would be preferable. and it would always be advisable to select the acorns for sowing from a good variety. The common Oak of Herefordshire, Monmouthshire. Shropshire, &c., is the Q. pedunculata; in the greater part of Herefordshire it is a tree of very fine upright growth, and the timber is as highly esteemed by shipbuilders as that of any wood in England. In some parts of Herefordshire, bordering on Radnorshire, and in Radnorshire, this Oak is replaced by a variety of Q. sessiliflora of a slow spreading growth, which in the cold higher parts of the latter county is a stunted tree, of little value. In the valleys, and where it spreads into Herefordshire, it is a fine tree, but of slow growth, makes very strong spreading limbs, but seldom produces a good upright bole. Here, therefore, whatever be the real difference in the durability of the timber, both are so durable that that difference makes none in the marketable value, and the Q. pedunculata, from its better and more rapid growth, makes a better return to the planter. In some parts of Shropshire there is a variety of the Q. pedunculata, of which the fruit-stalk remains very short, and has been confounded by some with Q. sessiliflora, but the foliage is very different. Its general aspect is that of the Herefordshire Q. pedunculata. In Buckinghamshire, and some neighbouring Counties, there is a variety of Q pedunculata, with the leaves downy underneath (they are quite smooth in Herefordshire), the qualities of this variety are unknown to me, but the mode of growth has struck me as not near so fine as that of the Herefordshire Oak. On the Continent (that is in western states), the Q. sessiliflora and pedunculata are the two finest Oaks, but there the sessile one is generally the most spreading, whilst the pedunculata tends rather to assume the pyramidal form, making a better bole, but inferior limbs. There are, however, many varieties of both, as to hairiness or smoothness of leaves, the duration of the leaves, falling off in some early in autumn, in others remaining green til January, or turning brown in November or December, but not falling off till they begin budding in spring, and most of these varieties differ from each other in the general form and mode of growth of the tree, which of course affect the value of the timber. The great difference in the value of Deals from different countries, though all the produce of one species (but of different local varieties), is well known. In the mountains of Styria I have been shown two varieties of that species (Pinus sylvestris), scarcely distinguishable botanically, but which I have been assured are well known as yielding Deals of very different qualities, and all over Europe the Deals from Norway and North Germany are much more highly esteemed than those from the centre of Europe. In the warmer hilly parts of France and of Italy the Q. sessiliflora is replaced by the Q. pubescens, which some have considered to be a mere variety of it. It is a tree of small stature, and very little value.—*G. B.*

Resinous Timber.—What is the proper season for felling resinous trees, viz.:—Larch and Fir, winter or summer? The above is a very important, but I believe as yet an unsettled question; some persons entertaining the notion that such trees should, like all others, be felled in winter; others that their timber will be more durable if felled in summer, when the whole tree is thoroughly impregnated with resinous juices. I am informed, on what I consider good authority, that all the Baltic timber is felled in summer, and in Cumberland, where Larch bark is used for tanning, the trees are of course felled in the same season. Any of your readers who should visit Switzerland, might easily obtain decisive information from the mountain guides, who no doubt are thoroughly acquainted with the subject.—*X. Y. Z.* [Perhaps this matter will receive the attention of some correspondent who has experience concerning it.]

Glass.—As you have deemed it justice to Mr. Cogan to print his letter, I doubt not you will think it equally just to publish the condescension of my notice of it. Mr. Cogan states, "an article in your Paper of Nov. 29 (page 802) signed 'A., Walton,' is a mis-statement I feel it necessary to contradict." He then proceeds to state facts which corroborate to the letter every circumstance I, in that article, asserted. My statement was simply that he, Mr. Cogan, sent me a sample of good glass, with which he undertook to furnish me at a named price; that I ordered 14 dozens of small squares of such glass, and that he sent me 14 dozens of an article (of both of which I enclosed you a sample), which you, yourself, pronounced to be, not only inferior, but of not half the value. After a bungling attempt at sarcasm, Mr. Cogan proceeds in his "reply" (?) In this he frankly, though for his purpose not very wisely, admits that he sent me the sample of thick, good glass, and executed the order with thin, bad glass—the very commonest of the old window glass! So much for my "mis-statement," and for Mr. Cogan's "contradiction". He says, "when this order came (without a sample inclosed), I concluded from the smallness of the size that crown was required," omitting the broad fact, which I am confident was contained in my first inquiry, that the two sizes were therein mentioned, and he concludes with asserting: "I shortly afterwards received a most uncivil letter, and judging I had to do with some ill-tempered or litigious person, I wrote to say if he was not pleased, I would take the glass back. What fairer proposal could a tradesmen make?" None, certainly, if he paid the carriage to and fro. But Mr. Cogan may think it "uncivil," that I doubt the fact of his having ever written any such letter at all, as certainly I never received it; as to the "incivility" of which he complains, persons in general do not, I believe, bandy compliments with tradesmen whom they deem guilty of fraud; and though Mr. Cogan, for aught I know, may be far above the suspicion of any such delinquency, his mistake, if mistake it were, would have been more judiciously repaired by a frank private acknowledgment of error, than by an evasion which, if he possesses common sense, he must have foreseen would draw upon him this unanswerable *exposé* of his mode of transacting business.—*J. Arnold, Walton-on-Thames.*

Heating and Ventilating.—I am glad to see the subject of keeping the atmosphere of hothouses in constant motion, brought into notice; as Mr. Glendinning observes, it is a subject which has had much less attention than it deserves. On referring to the section given at p. 834, I can easily comprehend how the atmosphere will be set and kept in motion while the external air is admitted, but as it would be alike desirable to keep up this motion in the house at seasons when it would not be advisable to admit a rush of external air, I do not quite understand how this could be effected, unless the air tunnel was in some degree converted into a syphon, the openings B B being the longer legs, and A the shorter. I am perfectly sensible that the hottest portion of the house is, as Mr. G. observes, where the hot-water pipes are placed, yet surely a greater impetus and certainty would be communicated to the motion of the atmosphere, if the air at B B made its escape at a higher point (or level) than where it enters the air-tunnel at A.—*Wm. Henderson, Oxton-hill Nursery, Birkenhead.*

Morphology.—A short time ago, while describing a new species of Glochidion, I casually met with a very curious flower, of which I send you a sketch and description, as a contribution to the articles which occasionally appear in the *Chronicle* on vegetable morphology. The genus Glochidion is monœcious, belongs to the natural order Euphorbiaceæ, and is nearly related to Phyllanthus. The calyx in both the male and female flowers is six-parted, with the divisions in two series. The male organs in the species in question consist of a central column, round the axis of which are six adnate linear two celled anthers; the whole very much indeed resembling the antheriferous column of Myristica or Nepenthes. The ovary in the female flower is six-celled, each cell containing two collateral pendulous ovules. In the flower of which I send you a sketch, you will find that the one-half of it is male and the other female, there being three cells on one side with two ovules in each, and three anthers in the other attached to a semiterete fleshy column. The calyx was exactly similar to that of a normal female flower. In the median line the male and female organs have firmly united to each other. In this case there can be no doubt that one-half of the elementary organs of a male flower have become feminine, or *vice versa*, and it is another of the many instances already on record which prove that the different parts of a flower are not special organs, but modifications of a simple elementary organ—a leaf—liable to particular changes under particular circumstances.—*G. Gardner, Ceylon.*

The spot on the Pelargonium leaf.—I am of opinion that this is caused by cramping the roots, and the following are my reasons:—In a miscellaneous collection of Pelargoniums, I observed that some plants were much affected by spots, while others standing close beside them were perfectly free from the evil. Upon examination of their roots, I found that those most affected had become pot-bound, while others not so much disfigured, had not quite filled their pots with roots; and those perfectly free from spot had their roots scarcely through the mould. Those that were pot-bound I shifted, and watered with guano-water, which induced them to produce new leaves, and although this was done nearly three months ago, they have, as yet, shown no symptoms of disease, while the old leaves remain spotted, clearly indicating where the disease stopped. I still continue occasionally to water the plants with guano-water, with beneficial effect. Surely this goes far to prove that cold and damp is not the cause of the spot.—*S. Hood, Ickleford Gardens.*

Horticultural and Agricultural Societies.—In an editorial article some time back, I think you pretty well set the question at rest, as to the beneficial tendency of Horticultural and Agricultural Societies. Previously I had always endeavoured to advocate them in my small way, whenever I heard their utility, or beneficial tendency impugned. It will be no new thing to you to be told that there are some "croakers" still—some so selfish, that unless they can see a Society so constructed and managed as in a direct way to promote their own interests, they scruple not to raise the hue and cry that these Societies are a great evil, and predicate all evil things concerning them—as their ultimate extinction—coming to nought, and "like the baseless fabric of a vision, leaving not a wreck behind," &c. I, for one, have no such gloomy apprehension, but just the reverse. One notion I have often combated, with a "croaking" friend of mine, viz., that these Societies are injurious to the nursery trade. Now, of all possible things that may be charged against them, this is one of the most baseless. What in the name of wonder has created, and what sustains the unprecedented taste (rage shall I call it?), for horticultural pursuits and ornamental gardening, so widely, I may say universally, diffused throughout the length and breadth of the land?—what but these very Societies? And has not the stimulus thus given created a demand for the productions of the nursery infinitely exceeding all former example?—so that now there is hardly a town, or even a village from John o'Groats to the Land's End, but what can boast of possessing its nursery—many of a plurality and of no mean extent either. Away, then, with the absurd outcry, which is as groundless as it is untrue. Some, also, object to detail and management, and one of the principal parts of which, as regards the public, is the exhibitions. Unsuccessful exhibitors are not unfrequently "croakers," and find all sorts of faults, some with the placing of their articles, some with the blindness and stupidity of the judges, who cannot discern the merits of their articles; and finally, some find fault with the appointment of the judges and those who appoint them, &c. It would be a hopeless task to try to satisfy all the "croaking" fraternity: at the same time, it would be presuming too much to aver that everything is conducted up to the very acme of perfection. Of the two great Societies, the Horticultural and the Botanic, which adorn the vicinity of London, some say this of one, and some that of the other; but one point in regard to the latter Society (the Botanical), I have heard many remarks about, and a great degree of dissatisfaction expressed in the mode of choosing judges for their exhibition. If I understand it rightly, a circular is sent to all the exhibitors, and they choose each a name, or set of names, and those having the majority are appointed. This may seem a very fair mode, but some say it brings in a host of nurserymen, whom they object to as likely to be biassed in favour of their own customers. Others say that nurserymen should never be so employed at all: to this I demur. Others say that the exhibitors choosing, is like a person on trial choosing his own judge, instead of that appointed by the Crown, which involves a corrupt bias. All this I mark down as showing so many currents of opinion; my own comes last, and it is this: that in all cases the Council, or officers of these Societies, should select the judges; and, to use a phrase of jurisprudence, the exhibitors should be tried by their peers: to this no one could reasonably object.—*Q.*

Potato Murrain.—It is the belief of some that a fungus is the cause of this disease. From facts, however, which have come under my own cognizance, I am led to hold a contrary opinion. I have about three or four bushels of last year's Potatoes (they have been above twelve months out of the ground) that have been since spring in a corner of a tool-house, held up in front by a few loose bricks, and, as might be expected, they have put forth numbers of small tubers, and the greater part of these small tubers are diseased and bad as any that have been grown in the soil in the open air. I should suppose that the manner in which the fungus is conceived to affect them is by a transition from the leaf to the tuber; however, in my case it will be perceived that such is not the case, as not a single leaf has been formed. The small tubers have been produced from the intercellular tissue, or elaborated matter of the old Potato, and without the assistance of any foliage whatsoever; but as the tool-house door stands open all day, and the Potatoes are not far from it, they are consequently under atmospheric influence, and the greater portion of them are covered with fungus, which seems to have proceeded from the top to the bottom of the heap. I have likewise some early Potatoes that are diseased to the very centre without a fungus having yet made its appearance upon them. These two facts surely prove that the fungus is not the primary cause of the disease, which certainly does not occur through the agency of the leaf. I have always been of opinion that it is to the dull weather we have experienced that we must attribute the cause. The plants have been charged to excess with water, which, owing to the absence of sun-light, could not pass off by evaporation; this, then, has produced a disorganisation of the tissues, and disease has followed in consequence. I observe an article in last week's Number setting forth the average quantity of rain that has fallen during the last eight years, as a proof that the disease is not caused by moisture. It is not the great quantity of rain that has fallen that is to be considered the cause, for we certainly have had more in other years, but the absence of bright sunlight must be kept in view; for days the sun never broke forth to dispel the moisture of the atmosphere, or to elaborate the juices of the plant. I cannot conceive any other cause for the small tubers grown in the tool-house being diseased (unless it is to be ascribed to some unknown atmospheric condition); this fact sets at rest the opinion as to manure of any kind being the cause, none whatever being present. Lime cannot be considered an antidote to the growth of fungus; for a great quantity of diseased Potatoes here has been well dosed some time ago with caustic lime, and on many of them the fungus is abundant; not even drying and greening by exposure will entirely prevent its growth, as I myself have proved, although it does partially. Mr. Ayres remarks that he cannot add his testimony to the beneficial effects of greening. If the Potatoes are diseased previously to greening, the disease will proceed, although much more slowly, and such I have no doubt was Mr. Ayres's case; such is the case with some of mine; but greening Potatoes for seed, if perfectly sound, I believe does produce bene-

ficial effects; that the Potatoes have received the disease during their growth I feel firmly convinced, otherwise they would not receive it after, for I have some Ash-leaved Kidneys green and ripened early on a raised slope in the garden, and greened by a long exposure, and they are now as promising seed as I could wish, and I have no fear that they would have remained sound if not greened. The question for seed another year appears to me a serious one. I am afraid planting Potatoes diseased at all, either now or in spring, will prove a fruitless effort, as I doubt they will rot when they come in contact with the moisture of the soil.—*Henry Wood, Stutfold Hall.*

Experiments with Autumn-planting Potatoes.—Walnut-leaved Kidney Potatoes were planted whole in my garden three days before the commencement of the severe spring frost. A portion was covered with straw, and the remainder left without protection. They were planted about three inches deep; not a single set was destroyed by the frost. This autumn I have had some planted whole; some cut; some with the manure above; some with it below the sets; some with the manure dug into the whole of the ground; some with no manure; some with the surface level, and some with it ridged above the sets. I have induced a number of my allotment tenants, by small presents, to try the same experiments. In spring you shall be informed of the result.—*Sigma.*

Autumn Planting Potatoes.—I live in a neighbourhood (Cheddar and Axbridge) where there are more early Potatoes grown than in any other parishes in England, and at this season, when all persons are complaining of the disease, I have done my utmost with the Potato croppers to prevail on them to plant during the autumn, but without success. The man who I was desirous in particular should adopt this plan more than any other, was a Mr. George Spencer, of Cheddar, whose industry in bringing forward early vegetables for the Bristol and Bath markets I had often admired, and whom I had talked to on the subject of the new method of cultivation. I did my best to get him to plant in the autumn, but my efforts were fruitless; why should I take this trouble, said he, when I can grow three crops of Potatoes in the same ground in the year, if I begin in February? that he could do so, or had done so, I doubted, but he assured me that he was ready to verify on oath that in February, 1840, he planted some early Ash-leaved Kidneys with good rotten manure, and on the 8th May he dug a good crop, without manuring he planted the same sort and dug again in August, immediately after which he planted and dug the third crop on the 25th October. The second and third crops he says (if possible) were better than the first, but at each digging they averaged 1*s.* 9*d.* per peck, so that there was only one manuring for the three crops. Now, said George Spencer (and he is a man who is respected, and can be believed) can any of the gentlemen professors beat this? Mr. Spencer is a neighbour of mine, and I know him to be a man of the strictest integrity, and who would shudder at a falsehood, so that I can safely say that what I have written is correct. Our land is of the best quality. Mr. Spencer assures me that he regularly grows his two crops of Potatoes, after which he sows Vetches, and digs them in in December, to manure the land for the next crop of Potatoes, and I have sufficient proof that they are of the very best quality, which I account for from being grown continually on the same ground.—*A Subscriber.*

Societies.

CALEDONIAN HORTICULTURAL SOCIETY.

December 1.—At this, the winter meeting, a considerable number of good things were brought together, and numerous prizes were awarded. For the prize offered for the two best bunches of retarded Grapes, there were five competitors. The Silver Medal was voted to Mr. Young, gr. to Mrs. H. N. Ferguson, the kind being White Muscat of Alexandria. A second premium was awarded to Mr. Dodds, gr. to the Earl of Mansfield, for Black Damascus and White Tokay. For the best six sorts of dessert Pears eight competitors appeared. The first prize was again assigned to Mr. Young, for Gansell's Bergamot, Swiss Bergamot, Beurré d'Aremberg, Beurré Diel, Winter Nelis, and Crassane; and a second premium was voted to Mr. Gardiner, gr. to the Earl of Stair, for Beurré Diel, Beurré d'Aremberg, Marie Louise, Crassane, Winter Nelis, and Forelle. Seven competitors tried for the best six kinds of table Apples. The Silver Medal was awarded to Mr. Robertson, gr. at Kinfauns Castle; the kinds were—Ribston Pippin, Golden Pippin (large and in the most healthy state), King of Pippins, Phillips's Seedling, Hay's Seedling, and Redstreak; and a second premium was awarded to Mr. M'Donald, gr., Drummond Castle, for Delaware, Golden Pippin, Winter Strawberry, Old Nonpareil, Calville Blanche, and Cellini. For the 12 finest clusters of Chinese Chrysanthemum, different varieties, there were four competitors. The first prize was gained by Mr. Young, with Princess Maria, Queen, Marquis, Lucidum, Superb clustered Yellow, Bicolor, Defiance, Vesta, Beauty, Victory, Madame Pompadour, and Minerva; and a second premium was awarded to Mr. Addison, gr., Gosford House, for Princess Maria, Gem. Formosum, Lucidum, Minerva, Tasselled Yellow, Marquis, Queen, Vesta, Superb clustered Yellow, Theresa, and Defiance. The only kinds of vegetables for which premiums were offered were Broccoli and Savoys; and very excellent specimens of both were produced. For Broccoli a first prize was voted to Mr. Gibb, gr., Salisbury Green, for Grange's variety; and a second to Mr. Cossar, gr., Kingsmeadows, for Seaford and Early White. The premium for Savoys was awarded to Mr. Pearson, gr. to Captain Peat, for the Cape sort. Among Amateurs Mrs. Haig exhibited specimens of Epiphyllum truncatum and bicolor, Centradenia rosea, covered with flowers, and Ardisia crenulata, with bright red berries. Professor Syme exhibited an admirably grown specimen of Erica hiemalis, measuring nine feet in circumference and three feet in height, densely clothed with flowers. Some very superior White Brompton Stocks, from the garden of Sir J. Gibson Craig, Riccarton, were much admired. Messrs. J. Dickson and Sons exhibited an Erica hiemalis about eight feet high, thickly set with flowers; and Messrs. Carstairs, Kelly, and Co., a flowering plant of Tropæolum Lobbianum. Some excellent specimens of fruit were sent for exhibition only, in particular a large collection of French and Flemish Pears, of the newest and most approved sorts, from M. René Langelier, of Jersey; and others of equal merit from the garden of Luffness in East Lothian. From Scone, besides the two sorts of retarded Grapes already mentioned, seven other kinds were transmitted for exhibition, viz., White Frontignan, Grizzly Frontignan, White Muscadine, Black Hamburgh, West's St. Peter's, White Muscat of Alexandria, and Chasselas musqué. Figs of the second crop, from the Peach house at Callander House garden, were regarded as a remarkable production; and beautiful specimens of the Dunelow Seedling and Coates Apple, from standards in Strathallan Castle garden, were much admired. At this meeting it was agreed that there should be a Strawberry Festival held in the Garden on the 18th of July next, and an Anniversary Dinner in Edinburgh on the 3d of September.

LINNEAN SOCIETY.

Dec. 16.—E. Forster, Esq., in the chair. G. B. Buckton, Esq., of Hornsey, was elected a fellow. A specimen of the fruit of Talauma fragrantissima, the Organ Nut of Brazil, was presented by J. Miers, Esq. A collection of Australian plants, chiefly from the neighbourhood of Sidney, and the fruit of a species of Lecythis, were presented by the Rev. W. Hincks. A paper was read by the Rev. W. Hincks, on the causes of disruption of vegetable tissue, especially in a horizontal direction. The object of the paper was to point out the immediate physical cause of the various forms of horizontal dehiscence of various parts of plants. The three principal causes to one or other of which all the forms of disruption might be referred were, first, the ligature of parts contained within by an external growth. Secondly, an unequal growth of parts. Thirdly, internal parts growing more rapidly than the external. To one or other of these causes may be referred the separation of tissue which takes place in the articulation of the stems of some plants, and perhaps, also, the fall of the leaf, the separation of the petals and sepals, the bursting of the anthers in Lauraceæ, the horizontal dehiscence observed in the fruits of Anagallis, Lysimachia, &c., and the more remarkable dehiscence of the various forms of Lecythis. The horizontal dehiscence of the fruits of plants was mostly due to the third cause enumerated, as also the dehiscence observed in the urns of Mosses. The paper was illustrated by specimens from the museum of the Society, and the author's own herbarium.—A continuation of Dr. Hooker's description of the plants of the Galapagos Islands was also briefly communicated to the Society.

New Plants.

Oxalis sensitiva. Sensitive Wood-sorrel. (*Greenhouse Annual.*) Oxalidaceæ. Decandria Pentagynia.—This curious little sensitive plant often comes up among mould received from the East Indies, and, being an annual, will sometimes take possession of the soil in the garden pots of hothouses, so as to become troublesome. It is found wild over all the tropics of Asia; or at least, if there are several species confounded under the same name, some one or other is there found. Dr. Wight inclines to the opinion that various species are mixed up by botanists under the name of Oxalis sensitiva, differing in their manner of growth, hairiness, form of the leaflets, and other circumstances. We know not how this may be, but this is the only one that we have seen in cultivation. It was raised in the garden of the Horticultural Society from seed sent from China by Mr. Fortune; and is quite different in the stamens and stigmas from the plant figured by Dr. Wight under the name of Biophytum Candollennum. De Candolle distinguished this, and another species, from the genus Oxalis, because the stamens are separated all the way to the base; but the analogy of the genus Geranium forbids us to attach any importance to the circumstance. Rumphius tells us, that in Amboyna the leaves are so extremely irritable that they cannot bear that the wind should blow on them, or even that they should be breathed upon. At the least irritation they close up, and the plant looks as if it were dead. We see no such sensibility in our hothouses. He adds, that the amount of irritability varies from time to time, and from individual to individual; that the leaves are most able to bear irritation before 8 o'clock in the morning, when the sun has just expanded them. This sensitive quality is somewhat injured if the plant is removed into a garden. The worthy Dutchman expresses his surprise that so delicate a plant, which cannot bear the least molestation, should, nevertheless, be so continually found in gardens, and by the roadside, where it is most exposed to violence; doubtless, he adds, it is like young ladies, who wish to be looked at, but not to be touched. Among the nations of the East, the plant has been applied to various superstitious purposes, as an ingredient in philters, and magical incantations, concerning which the reader is referred to Rumphius, who gives a copious account of the odd fancies connected with its use.—*Botanical Register.*

Stanhopea inodora. Scentless Stanhopea. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—Among the most beautiful of the Stanhopeas is that apricot-coloured species, with very large flowers forming a spreading spike, to which the name of graveolens has been applied in consequence of its offensive odour. This species is in many respects very like it; but it is scentless, and much paler than any variety of S. graveolens which we have seen. Messrs. Loddiges imported it from Mexico, and it flowered in June, 1843. It differs from S. graveolens not merely in its pale scentless flowers, but other circumstances of more importance. In the parts of the flower we are not, indeed, prepared to point out much difference beyond the form of the column, which in this species has its sidewings gradually narrowing downwards till they disappear, while S. graveolens has them as broad at the one end as the other, whence the column has almost the form of a parallelogram. The form of the spike is quite different in the two species, owing to the unusual shortness of the ovaries. In S. graveolens it is very wide, after the manner of S. oculata, the ovary being considerably longer than the lateral sepals; but in S. inodora it is as much contracted as in S. insignis, there being little difference between the length of those parts. If the species were to be distinguished by more popular characters, it might be stated to have the inflorescence of S. insignis, the form of S. graveolens, and the colour of S. saccata, without its dots. If S. insignis inhabited the same country as S. graveolens, one might fancy the S. inodora to be a mule between the two.—*Botanical Register.*

Miscellaneous.

Attachment of Wolves to Man.—Our menagerie contains several tame wolves. A female wolf, snared when full grown, had nevertheless grown tame enough to be permitted to live with dogs, among whom she had several whelps. Another wolf, of which F. Cuvier relates the history, presents to us an instance of one of those profound attachments of which we believe the species of the dog even to be hardly capable. "This wolf," says F. Cuvier, "had been reared like a young dog; he followed his master everywhere, and was pained by his absence; he obeyed his voice, showed the most entire submission, and in all these matters scarcely differed in any respect from the most tame domestic dog. His master being obliged to absent himself, made him a present to the king's menagerie: there, shut up in a cage, this animal was several weeks without showing any gaiety, and hardly eating at all; nevertheless, his health was restored, he became attached to his keepers, and seemed to have forgotten any other affection, when after 18 months his master returned. At the first word which he pronounced, the wolf, who had not seen him in the crowd, recognised him, and testified his joy by his movements and his cries. Put at liberty, he soon covered his old friend with caresses, as the most attached dog would have done to his master after a separation of a few days. Unfortunately, it was necessary to quit him a second time, and this separation was again a source of the most profound sorrow; but time healed this new grief. Three years passed away, and our wolf lived very happily with a dog whom they had given her for a companion. After this space of time, which certainly would have been sufficient for a dog of the most faithful species to forget his master, that of the wolf returned; it was evening, all was closed up, and the animal's eyes were of no avail, but the voice of this dear master had never been effaced from his memory; as soon as he heard it, he recognised him, and responded by cries which announced his impatient desires; as soon as the barrier which separated them was raised, the cries were redoubled, the animal bounded forth, placed its two paws before upon the shoulders of him whom it loved so tenderly, passed its tongue over every part of his face, and threatened with its teeth its ordinary keepers, upon whom the moment before it bestowed marks of affection. It was necessary to separate again. After this sad moment the wolf became melancholy, immovable, it refused all nourishment and became thin: at the end of eight days it was inconsolable, and for a long time they were fearful of losing it. At length its health was re-established, its keepers dared to approach it again, but it no longer suffered the caresses of any other person, and only replied by menaces to those whom it did not know."—*M. Flourens's Instinct of Animals.*

The Botanic Garden, Cambridge.—The Syndicate appointed to consider the steps necessary to be taken for changing the site of the Botanic Garden have reported (in addition to their report of July last), that Professor Henslow had visited the Botanic Garden at Kew; that they had calculated the probable expense of income. They conceived that the available funds were inadequate to meet the expense of the proposed new garden; and that such a design could only be carried into effect by taxing the members of the University for a certain number of years. They recommended, in case the University wished the design of a new garden to be carried into effect, a new syndicate to be appointed to consider the most convenient manner of taxing the members of the University.—*Cambridge Paper*

Museum of Cassel in Northern Germany.—In the

collection of natural history at this museum a very interesting set of volumes, as they appear to be; though, when examined, they prove to be no re- library, but specimens of the woods of 500 different European trees, made up in the form of books. The back is formed of the bark; the sides, of the perfect wood; the top, of the young wood, with narrow rings; the bottom, of the old wood, where the rings are wider apart. When one of the volumes is opened, it proves to be a little box containing the flower, seed, fruit, and leaves of the tree, of which it is a specimen either dried, or imitated in wax. Something of this kind, though with a more especial reference to the age of trees, might be made an interesting portion of our own collections in natural history, both public and private — *Chronicles of the Seasons.* [There is a similar collection, formed in Mexico and California by the late Dr. Coulter, now in the Herbarium of Trinity College, Dublin.]

The Potato Disease.—At a meeting of the Manchester Literary and Philosophical Society, Mr. A. Campbell, curator of the Botanic Gardens, stated that he had tested the efficacy of fumigating with sulphur, suggested by Mr. Thom, and had found that in those Potatoes which had been subjected to the process, the disease never made any further progress, even though they were subsequently placed in contact with diseased tubers. He also referred to other experiments, most of which went to prove the necessity of exposing the Potatoes to light and air, and the evil effects of hogging or pitting them. Mr. Dale said he had planted a Potato which had been fumigated, and found it to vegetate as well as those to which the sulphur had not been applied. The whole of the observations that were made confirmed the accounts previously given, that light and air, a good ventilation, and a frequent examining and turning of the Potatoes, are the most effective agents in checking the disease.—*Manchester Guardian.*

Bees.

Answers.—*S.*—There was nothing remarkable in one instance of two "royal nymphs" being cast from the hive after the queen was replaced with the swarm, such might have happened whether she was replaced or not. I knew an instance during bad weather of 12 young queens being cast out of the hive before the second swarm. I do not dispute the real meaning of the word nymph; but I do in the sense that most entomologists use it, viz, that bees' larvæ spin cocoons and change to the pupa state before they are insects. The fact is, when they are about to change they merely close the openings of the cells, and are matured as young wasps are; in the cells, not cased in a tough varnished substance like the larva of moths and flies as a fence against the weather. Those who fish with young wasps as bait, find many as soft and milky as the maggots in the open cells, which is the case with the bees. Your stock must have been ripe for swarming or the hive badly constructed, otherwise the morning sun could not have induced them to swarm at 9 o'clock. Sunshine has much influence on bees, but few will trust them to the shade during the swarming season. The following is a good instance of it:—A friend of mine in Norwich, like Bonnear of Glasgow, kept bees in his dwelling-house; the hives stood upon a table close to the wall, in which were holes for the bees to enter by. The sun, of course, never shone upon the hives, still they swarmed in the usual way, and even though there were air-holes in some of the hives. You say that your bees regularly swarmed before you shaded them, therefore you found the ventilators of no use. What I said concerning the state of a stock after a swarm was replaced with a queen seemed plain enough, especially the extracts from Dunbar. You consider that the presence of the "old fertile queen would make a material difference in their working in the interim" Need I repeat that the bees will be more or less idle according to the condition of the hive and the weather. And also that the interim may be a day, nay, perhaps only a hour. I say so on the fact that the old queen knew the condition of her successors before she left the hive, and where is the certainty of her remaining when replaced? Since your bees swarmed this season, and you do not say that you replaced them, but observe, when they swarmed, you got no honey, the following is not very clear:—"Last year, by shading them, I prevented their swarming, and got 16 lbs. of honey; this year I got 15 lbs."—*W.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

Hothouses.—The decoration of this department will depend in a great degree upon Begonias, Euphorbias, and Luculia gratissima, although the latter will bloom in a colder house. These should be carefully tied up and placed in the most conspicuous situations. It is always a good plan, when accommodation can be afforded, to keep some of these in a colder house, so as to prolong their season of blooming. Continue to keep up the temperature by artificial heat at 60°. *Conservatories.*—About every ten days the plants in this house should be completely re-arranged, those going out of flower should be removed, and a new supply added from the forcing pit; all plants, whether in this or in other departments, should be regularly gone over, removing the dead leaves, and tying in straggling branches. The surface soil ought to be stirred a little, and some fresh mould added. These little points, when attended to, give a tidyness of appearance, and produce a relish for the enjoyment of such places during the dreary season of winter. Be careful not to be caught in frost, keep out as much of it as possible by mats or other coverings, and have recourse to fires only when positive danger is to be apprehended. Attend to the compost yard, exposing decaying manures required for potting to frost at all times when opportunity offers.—*A.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

In this very changeable weather, walks requiring turning, or a coating of fresh gravel in the spring, might now have the sides or edgings adjusted; gravel might also be got in readiness for use, when wanted. Plants that have been protected during the few past cold nights, should again be exposed, if the weather continues mild. Ripe fruit, or seeds of shrubs, should be collected; cones of Cedars, Pinuses, &c., might also now be gathered. Roll walks that have been loosened by the late frosts, and protect shrubs from hares and rabbits, before the winter sets in. *Pits and Frames.*—Take particular care that damp leaves are removed from Neapolitan Violets, and give air every fine morning. Keep Roses in pots moderately dry, until they are to be started for forcing. Every fine day the lights should be taken off Verbenas, Petunias, Calceolarias, and Pelargoniums, and stop such as are growing freely, or appear to be drawing.—*B.*

III.—FLORISTS' FLOWERS.

Attend to the routine management as previously recommended. After frosts examine Polyanthus and Pink beds, removing all weeds as soon as they appear. Now is a good time to get together leaves, which form invaluable compost. Attend to newly formed Pansy beds; if the worms are troublesome, pour a little lime-water down their holes, which will speedily relieve you of their presence. Remove Polyanthus blooms as advised last week, and carefully observe, during a shower, whether any pots are exposed to drip; it is equally injurious to the Carnation and Picotee in frames, as to the Auricula.—*C.*

IV.—PINERIES, VINERIES, &c.

Watering Pines at this period of the year is in general out of the question, nevertheless cases may occur in which with swelling fruit, under a somewhat elevated temperature, it may become necessary—observing great moderation. As before observed, with respect to Vineries and Peach houses, in which forcing has commenced, let moderation be your maxim with regard to increase of temperature; all hurrying or quick forcing, at this period, is very likely to end in abortion. However, on bright days a much higher temperature may be indulged in—for solar warmth, although somewhat in excess, has a very different effect on vegetation in general to that of fire heat. Cucumbers in Pineries, or other structures adapted to their winter growth, should have every possible amount of foliage exposed to the light. The system of close stopping requisite in summer cultivation, by no means benefits the winter management. In summer, one or two full-grown leaves will cater for a given fruit; whereas, in winter, through the comparative absence of light, it requires treble the number to accomplish the same object. Continue, as opportunities occur, successional crops of Kidney Beans, Mushrooms, &c., and a few Ash-leaved Kidneys placed singly (whole) in forty-eight pots, will make an excellent early frame or pit in January, if a little bottom heat with covering can be insured.—*D.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

The comparatively mild state of the weather is favourable for the operations of planting, pruning, and nailing being carried on. Examine old fruit-trees, in order that such as are either not productive, or bear fruit of indifferent or bad quality, may now be cut back preparatory to their being grafted with better varieties in spring. Deferring to cut large limbs of fruit-trees till the sap is flowing is always injurious. The portions left, die back much farther from the sections than will be the case if the operation is performed before winter, and canker also is apt to ensue, so that the grafts are left with an unsound footing. In heading back large trees, imagine one or two branches, the result of grafting, to proceed from each stump, and then cut the limbs so that the new branches may not originate too near each other. *Kitchen Garden.*—In some cases hedges form the outer fence of gardens; Quick, more especially, should now be trimmed; dead wood, and unhealthy shoots, liable to be half killed by insects in the summer, are the consequences of cutting these hedges late in spring; and nakedness at bottom is occasioned by allowing the top to overhang. The sides of a hedge should slope regularly, like those of a pyramid—the top cannot be too sharp. If so managed, the barbarous mode of plashing will be rendered unnecessary—it may be said an impossibility. Attend to the covering of Sea-kale. Give plenty of air to Cauliflower plants, Lettuces, and Endive in frames. Potato chips, where sets are scarce, will be best preserved till the time of planting by being placed in soil only moist enough to keep the eyes or buds from drying up.—*E.*

State of the Weather near London, for the week ending Dec. 18, 1845, as observed at the Horticultural Garden, Chiswick.

Dec.	Moon's Age.	Barometer. Max.	Min.	Thermometer. Max.	Min.	Mean.	Wind.	Rain.

Sat. 27	41.9	30.1	37.0	6	0.40	1	4	1	3	2	3	4	1

The highest temperature during the above period occurred on the 25th, 1827—therm. 58°; and the lowest on the 24th, 1836—therm. 16°. The average temperature of the night of the 25th is lower than that of any other night throughout the year.

Notices to Correspondents.

The Reprint of Mr. PAXTON'S COTTAGERS' CALLENDAR is now ready, price 3d. each copy. An index has been added to this present edition. Parties wishing to have copies for distribution among their tenantry can have them at the rate of 25 for 5s.

Amaryllis—*A Constant Reader*—The stove species of Amaryllis will not succeed in Mar. A. advena, sarniensis, and Belladonna, Lycoris radiata and Valiota purpurea probably will.

Asparagus—*J H G*—We cannot give you the *rationale* of frosting; we do not understand it ourselves.

Cucumbers (see No. 37)—*Cromis*—Mr. Walker has been so obliging as to say that he has not forgotten his promise to give his mode of growing Melons, and that he will proceed to redeem it early in the year.

Heating—*W H*—All kinds of covering will assist in keeping frost out of a house, because they keep warmth in. Russia mats, and reed or straw mats, are among the best and cheapest contrivances for the purpose.

Insects—*Alpha*—Your Vines are infested with a scale called Aspidiotus Ostreæformis, *vide* the *Gardeners' Chronicle*, vol. 3, p. 805. The only remedy is to scrape and peel off the old bark and burn it immediately. *R.*——*F J C*—They are a species of Dung-fly, bred, I expect, from the manure. The minute worms on the Potato are a Vibrio; a Julus and Polydesmus accompanied them. *R*

Lawns—*W C*—Now is a good time for dressing lawns with pure soot.

Mushrooms—*Greenwood*—Mushroom-beds are prepared by collecting a sufficient quantity of horse-droppings, as free from straw as possible, into a heap, and turning them over repeatedly previously to the formation of the beds, in order that the violent heat arising from them at first may be [illegible]. In making the bed, the droppings are well beaten down and trodden; and when, after a few days, the temperature of the bed has settled down to about 70°, the spawn is inserted, barely covering it with dung, and afterwards firmly covering the bed with soil to the depth of 1½ or 2 inches. The whole is then lightly covered with hay several inches in thickness, and the work is finished.‡

Names of Fruits—*F, Waterford*—Bishop's Thumb Pear; Codlin.‖——*R E*—3, Aston Town; 4, Glout Morceau; 6, Wormsley Pippin; 6, Cluster Golden Pippin; 7, Lord Anson's Pearmain; 8, Braddick's Nonpareil; 10, King of the Pippins; 14, Easter Pippin or French Crab; 15, Wyken Pippin; 16, Althorp Crassane; 17, Ord; 18, White Russet. The best Apple, No. 12, is worthy of further trial; the other was juice.‖

Names of Plants—*Ghent*—512, Oncidium sanguineum; Odontoglossum cordatum; 906, is not this the same as 342, Oncidium ornithorhynchum; 907, this class cannot be distinguished by single flowers; it seems to be the large variety of O. sphacelatum.——*F K*—Your plant is a Tritonia not a Tritonia.——*W H H*—Chironia decussata, a greenhouse half-shrubby plant.——*A Subscriber*—Salvia patens and Verbena Salviæfolia.——*Juvenis*—Veronica ——*Vicairensis*—Daphne odora rosea.——*J Y*—Your eyes a little wider; the plant you have sent is a flower.——*Salopian*—Daphne odora rosea. You are right; it must have been the Mezereum, and some allied to it, that Linnæus meant.——*Inquirer*—We cannot name seeds. No 1 is the seed-vessel of a Delphinium, perhaps of D. Lablab.

Pansies—*W K*—Procure the following 12 sorts—Cleopatra, Pigeon and Mulberry superb, King's Exquisite and Striped elegans, Brown's Curion, Thompson's Coronation and Prince Major's Bridegroom, Pearson's Black Prince and Prince Albert, Duchess of Richmond and Arethusa.

Pelargoniums—*P Q*—These may be preserved over winter in a box, if packed with alternate layers of dry soil, sand or peat, and placed in a situation free from the effects of frost or damp; the plants must be cut back freely, and have most of all their leaves before they are packed, and they should not remain longer than the beginning of March in the box before they are again potted.

Potatoes—*J B C*—We understand a cyder mill does not answer the purpose; it crushes but cannot rasp. Why not use the machines of which we have published plans. They are extremely cheap, and answer perfectly.

Pruning—*Reader*—You may prune your Gooseberry and Currant bushes now. Let the centres be kept free and open, cutting clean off any strong shoots that rise from that part. Cut out all branches that cross one another, leaving the leading shoots about 10 inches apart, and topping at a bud inclining to the open space. All lateral twigs not required to form branches should be spurred into a few buds. Black Currants require no pruning except thinning out the branches a little when the bushes have become large and full of wood. With regard to Raspberries which produce their fruit entirely on the previous year's wood, the old shoots should be removed and four or five of the strongest of the young ones tied up in their places, cutting clean off by the root all the rest of the young shoots. After they are tied up to the stakes (if that mode of training be preferred), shorten them to about 4 feet in height. You may water your Hyacinths as soon as they have made good roots.‡

Rhododendrons—*D B*—The colours of the following are—floribundum, crimson; rigidum, purplish crimson; catawbiense, panulatum, large rosy-pink; alta-clerense, crimson, free bloomer; Russellianum, bright crimson spotted; [illegible], deep crimson, bad flowerer; kermesinum (?); [illegible], purplish crimson, with dark marking, very fine; [illegible], pink; formosum, crimson; catawbiense, very large, lilac pink. We cannot recommend dealers.¶

Roses—*J P L Pyne*—The following are eight standard Roses adapted to a sheltered situation in the south of the county Cork:—Bremnus, Village Maid, Globe White Hip, Crested Moss, Queen of Denmark, Madame Desprez, Blanche de Bourg, and Double Persian Yellow.¶——*Constant Inquirer*—We seriously advise you to place yourself in the hands of any one of the great Rose growers, to explain to them your wishes, name your limits as to price, and trust to them for the rest. Rely upon it, this is the best and most economical way of setting to work. We have repeatedly given lists of choice Roses. See also the Appendix to the "Tree Rose."

Trellis—*Botanico*—Use iron uprights, and paint the whole black with black oxide of manganese, the cheapest and best of black paint. If you can get Bamboos cheap, they make a good fence by being placed aslant with respect to each other so as to form lozenge-shaped spaces; but they are not very durable.

Tulips—*An Ignoramus*—Seed having been saved from the best flowers, is sown at the proper time, the little bulbs taken up when the leaves turn yellow, are again planted and taken up, and this is repeated annually till they bloom. A selection is made from these *seedlings* when in flower, and those only preserved that have straight stems, finely-formed cups, with clear bottoms, either white or yellow: these *bulbs* with their *offsets*, constitute the *breeders* or *breeder state* of the flower, and must be grown till the colour breaks into stripes, when that takes place they are called *broken Tulips*, and are propagated by their *offsets*, which come like the parent. *Stain* is a word used to express a particular race or quality in a flower, as being inferior or superior to others of the same kind. *Bordered flowers* are those, having clear grounds and more decided markings than are usually seen, and is an expression equivalent to a flower being of a *superior strain*.

Misc—*Gib*—We cannot interfere. If a man chooses to offer buns to beggars, how are we to prevent it!

——"Oleum artocreasque popello

Largior,"

is a very old cry, and you should not wonder at its being repeated now-a-days.——*Killogie*—The cause for the screen is transparent. We do not approve of people being called upon to subscribe large sums for purposes which cannot endure any good to the subscribers; we do not like to see men of science demanding payment for every trifling service they may endeavour to render to the public; we are not inclined to sanction the erection of turnpike gates on the high road to knowledge, and we have no feeling in common with the [illegible] of the *Petimus*—Human physiology is not within the scope of this publication.——*W C*—The only sure way by which Balloon roots can be preserved from mice when planted out is by setting traps for the latter. Use brick traps, which may either be the figure 4-trap, or a pea may be put on a thread to support the brick.¶——*A Z*—If you have no better place you must keep your Pelargoniums through the winter in some large room over the stable. They should receive very little water and care must be taken in administering it not to scatter it about, as that would produce damp, which must be carefully guarded against. If there is any means of admitting air it should be taken advantage of in fine weather as Pelargoniums are very impatient of close confinement.‡

*** As usual, many communications have been received [illegible], and others are unavoidably detained till the required inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

HYDRAULIC RAMS to be had of FREEMAN ROE, Engineer and Fountain Maker, 70, Strand, London. Rams adapted to all situations.

No. 1 Ram, Supply Pipe, 4 inches.
No. 2 Ram, Ditto 2 inches.
No. 3 Ram, Ditto 1 inch.

Deep Well Engines and Pumps worked by Steam, Horse-power, or Manual-labour. Fountain Basin in Iron, from W. Rowley's pattern. Jets made to any device. Buildings, Baths, &c. heated upon the most simple and economical plan. Steam Closets. Cooking Apparatus, &c.

Sole Agent for TREMAN'S PATENT WATER PURIFIER.

The AGRICULTURAL CHEMICAL ALMANAC, by FREEMAN ROE, price 2d., now ready.

FARM TO LET, Seven Miles to the South of London. 134 acres: about 60 Grass and 70 Arable. Soil rather heavy. Address, S., *Gardeners' Chronicle* Office.

The Agricultural Gazette.

SATURDAY, DECEMBER 20, 1845.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, Dec. 24—Agricultural Society of England.
WEDNESDAY, — 31—Agricultural Society of England.
THURSDAY, Jan. 1—Agricultural Imp. Soc. of Ireland.

WE take the liberty of referring once more to Dr. DAUBENY'S paper ON THE ROTATION OF CROPS. His experiments had special reference to the theory of DE CANDOLLE regarding root excretions; and his object was to determine whether a failing fertility of soil consequent upon the repeated growth of the same crop on the same land, during a series of years, was attributable to poisonous matter of vegetable origin, or simply to an abstraction of those substances in the soil which we speak of as the food of plants. His objects, in fact, were, to use his own words, "first, to detect, if possible, the chemical nature of these supposed excretions; and secondly, to demonstrate their poisonous influence, by taking account of the expected diminution in the amount of the crop exposed to them, beyond that of another in which all the circumstances were the same, excepting the presence of the excretions in question. To accomplish these two objects, it seemed sufficient to set apart a number of plots of ground uniform as to the quality and richness of its soil, planting one-half of the number year after year with the same species of crop until the land no longer produced it, and the other moiety with crops of the same description, succeeding one another in such a manner, that no one plot should receive the same twice during the period of the continuance of these experiments, or at least within a short interval of one another. By weighing the produce of each plot, reduced to the same uniform condition of dryness, when it had arrived at maturity," he states, "I hoped to obtain data for computing, how much of the expected diminution might be referred to the exhaustion of the ground, and how much to the effect of excretions which the preceding crop had given out."

The following Table gives the results arrived at, as to some of the crops, so far as the influence of their repetition on the same land affected the weight of their produce :—

Tabular View of Experiments on the Rotation of Crops.

Name of the crop.	Whether planted in the same, or in diff. plots of ground.	Average of the first five years.	Average of the whole period.	General Remarks.
		tubers.	tubers.	
Potatoes	1 in the same	72·9	68·9	Merely cleaned from dust before weighing.
	2 in different	92·8	89·1	
	3 in the same	74·77	..

	2 in different	20·3	18·7	
Clover	1 in the same	10·9	14·8	Dried in the sun before weighing.
	2 in different	..	16·9	
Endive	1 in the same	53·9	51·5	Dried in the sun before weighing.
	2 in different	..	47·0	
Mint	1 in the same	31·5	24·7	Dried in the sun before weighing.
	2 in different	..	22·5	
Bk.-wheat	1 in the same	11·6	9.1	Dried in the sun before weighing.
	2 in different	12·5	10·6	
Parsley	1 in the same	61·25	39·75	In a green state when weighed.
	2 in different	..	87·8	
Tobacco	1 in the same	69·2	48·0	Dried in the sun before weighing.
	2 in different	..	32·0*	
Oats	1 in the same	..	28·0	Dried in the sun before weighing.
	2 in different	..	32.4	
Beet	1 in the same	..	258·0	In a green state when weighed.
	2 in different	..	231·0	
Tares	1 in different	..	13.25	Dried in the sun before weighing.

Setting aside four of these cases—Tobacco, Beet, Endive, and Mint—as exceptional, and these exceptions are satisfactorily explained by circumstances, for the recital of which we have no room, the general tenour of these experiments would seem to indicate a *manifest* advantage on the side of the shifting crops, varying from 1 to 75 per cent, but more generally approaching to the latter. Yet it by no means follows that this difference is to be attributed to the influence of root excretions. Were such the cause, we ought to perceive a more regular, as well as a more rapid, diminution in the permanent crop than is indicated in the above Table; we should not find, as was the case, the crop of Potatoes equalling in the fifth year the produce of the first; the Turnips, after sinking to 37·0 lbs. in the third year, rising in the sixth to 128 lbs.; not to allude to other similar instances of oscillation. If DE CANDOLLE's theory too could be carried out, we might have expected to find a more manifest improvement in the shifting crop occasionally occurring, owing to the excretions of the family of plants which had preceded it proving congenial to its constitution. But if nothing positively injurious be imparted to the soil by the crop, the gradual falling off in the amount of the latter can only be attributed to the deficiency either of organic or of inorganic matter fitted for its development, in the soil in which it was reared. And a large portion of Dr. DAUBENY's memoir is devoted to the report of his inquiry into this matter. Its results were conclusive as to the less quantity of inorganic elements in every case, found both in the ashes of the plants of the permanent crops and in the soil of the beds on which they had been grown. The analyses necessary to the determination of the latter point exhibited a fact of very considerable agricultural importance, viz., the large quantities of various fertilising substances existing in the soil, but in a condition in which they were not immediately available for the growth of plants.

It had long been known that the older analyses, those for instance by Sir H. DAVY, were very imperfect indices of the agricultural value of the soils of which they professed to give the constitution. They gave information neither on the texture of the land nor on the presence of the phosphates and alkalies, those substances present, relatively speaking, in small quantities, but on which nevertheless fertility has been proved mainly to depend. But we now find that but few even of the later analyses are entitled to much confidence; for a distinction first made by Dr. URE in reference to the ammonia existing in guano, is shown by Dr. DAUBENY to be equally applicable to the phosphates and alkalies occuring in soils. They generally exist "potentially" or in a dormant state, in abundance—but it is not till they have been brought into a soluble form that they are of any use as the food of plants; and the powerful reagents employed by the chemist may have demonstrated the existence of substances in abundance—substances admirably capable of conferring fertility, and yet if they are not present in a form in which plants can make use of them, barrenness may prevail after all. It was reserved for Dr. DAUBENY, in conjunction with Mr. WAY, to devise and execute a method of analysis, by which not only the amount of each ingredient of the soil, but the condition also of each, whether dormant or active, was ascertained. This consisted mainly in ascertaining and weighing the substances in a given quantity of soil, which a certain quantity of water, impregnated with carbonic acid, was capable of dissolving out in a given time. The water thus prepared and used was, in fact, a sort of strong rain-water, containing, as it did, more than the ordinary quantity of carbonic acid, and it acted on the soil, only with more than ordinary intensity, just as does every shower that falls. The analyses of soil thus conducted, showed that while hardly any difference existed in the *absolute* composition of the soils which had borne repeated crops of the same plant, and those which had yielded successive crops of different plants, yet there was a great difference between them in the various materials they contained, as regards the quantity of each, in a form immediately available as the food of plants. The following is the instructive inference on this subject which Dr. DAUBENY himself draws from the results of his inquiry :—

"That it by no means follows, because a soil is benefited by manuring, even though that manure may, as in the case of bones, guano, &c., derive its efficacy from the phosphates it supplies, that the soil is therefore destitute of the ingredient in question, since it may happen, that it possesses abundance of it in a dormant, though not in an immediately available condition.

"In those cases, in which the agriculturist has been assured by the results of actual analysis that there is no real dearth of the principles essential to his crops in the soil which he is cultivating, but where he has ascertained either by the chemical mode pointed out, or by an experience of the good effects brought about by manures, that the principles in question are not in a state to become immediately applicable to the purposes of vegetation, three courses appear to be open to him :—

"1st. To apply a sufficient quantity of the same materials in a state in which they can be absorbed by the plants without delay; 2dly, to allow the ground to remain fallow, by which expedient time is allowed for a further decomposition of its materials, and for a renewed extrication of its useful ingredients, to take place; 3dly, to produce by the various methods in daily use, such a stirring and pulverization of the ground, as may admit of a more thorough admission of air and moisture, and consequently accelerate the process of disintegration in a greater degree than would take place under natural circumstances.

"Examples will occur to every one of the successful adoption of each of these three practices; of the first, in the ordinary process of manuring, and especially in the beneficial consequences resulting from the use of bones in the exhausted pastures of Cheshire and other similar localities; of the second, of the system so general in the early stages of agriculture, of allowing land to remain at rest for a certain period, with a view of restoring to it its exhausted powers—a method which would be absurd, if the alkalies, phosphates, and other of the more scanty ingredients were absolutely deficient, but which would be likely to prove efficient if they were only locked up within the recesses of the soil, and required time to render them active; of the third, in the practice resorted to by JETHRO TULL, who boasted that he could always realise an abundant crop year after year without manure, provided the ground were only stirred and broken up sufficiently,—a statement which seems confirmed by some of the results of spade husbandry, and in a certain degree by those detailed in this paper, with respect to the permanent crops which are herein mentioned as having been made the subject of experiment.

"The choice between the above three methods will of course be determined in each instance by a balance of economy, and although in general this latter consideration will incline the farmer to prefer the ordinary method of manuring, either to the sacrifice of a year's produce, as in the second method, or to the expenditure of labour required to put into practice the third, still there may be cases where it might better answer his purpose to resort to one or other of them, either as being more advantageous in itself, or more suitable to the circumstances of the case.

"At any rate it may be important for him to be assured, that at the very time he is ransacking the most distant quarters of the globe for certain of the mineral ingredients required for his crops, he has lying beneath his feet in many instances an almost inexhaustible supply of the very same."

ON THE CARRIAGE OF SEWERAGE WATER BY RAILWAY.

THE leading article in your *Gazette* of the 30th ult. contains some important statements respecting the value and means of employing the sewerage of towns for agricultural purposes. The sewerage company alluded to in that article will confer vast benefits in the country around those towns whose locality is favourable for carrying out such a plan; but there are very many others which are either too small, or from other circumstances so situated as to be unlikely to pay for the erection of costly apparatus. Now, it is in such places as these that I would propose some such plan as the following, as the means to be employed in conveying the sewerage water or liquid manure into the surrounding agricultural districts.

It is well known that all railways are so laid down as to approach as near as possible to every town of any importance; I therefore believe that in a majority of cases the liquid manure could be had alongside of some part of a railway in or near such towns; here, for instance, near Hull, the line of the Hull and Selby Railway actually crosses the outfall, within a few yards of the Humber, of one of the main sewers of the town; a projected line of railway from the one above mentioned, to be carried on to Patrington, through the rich agricultural districts of Holderness, will cross a street at no great distance from the outfall of another main sewer; and from a second position on this line, a third large sewer will be crossed, so that here is an example to show that the sewerage of two-thirds of a town containing 70,000 inhabitants may be had without any difficulty. The country for some miles round Hull is nearly a dead level, and therefore not favourable for irrigation; but I have little doubt that there are many places on the various lines about to communicate with it, where the sewerage water might be conveyed with great advantage to the land, and the disposal of it to the farmers would be a source of considerable income to the parties interested in the sale of it. At Beverley eight miles from Hull, the Bridlington branch of the

* The average is here lower than in the former, because two crops of a different kind had been previously taken off the the ground before the first crop of Tobacco was sown. Hence this is so much inferior to the first crop of the preceding column.

Hull and Selby Railway will cross the main sewer of that town, where vast quantities of rich sewerage might be collected.

Having described the main features of the plan, I will now show how I think it might be carried out. The municipal corporations in all towns, being the legitimate proprietors of the sewerage, will have a direct interest in providing the means for delivering it to those who purchase it, and this might be effected by a simple arrangement of reservoirs constructed alongside the railway, and furnished with pumps for lifting the sewerage into wrought iron tanks built upon railway trucks. These tanks would no doubt be provided by railway companies, as the conveyance of the sewer-water would form an important item in their goods traffic; it would be certain, too, and increasing, as the mode of applying it became better understood. According to Mr. Smith's statement, eight tons of sewer water are sufficient to manure an acre of land; and Mr. Hudson says that the trucks on the narrow gauge lines will weigh (of course he means when laden) from seven to nine tons; so that in all probability about six tons of sewer water may be conveyed upon one truck, which might be left at the depôt on the railway in the same manner as other descriptions of manure, to be carted thence by the farmers in suitable liquid manure carts.

There are several questions to be considered with reference to the carrying out such a plan as I have here described. In the first place, there is the first cost of the liquid manure. Secondly, the carriage to the depôt on the railway in the country. And thirdly, the expense of conveying it into the fields: the sum total of these would give the cost of manuring the land. The next thing we are to consider is its relative value as a fertilizer, compared with other manures, and this is a question of great importance, because it involves many inquiries respecting the source from whence it is derived, and the manner in which it is collected and prepared for the use of the farmer. In densely populated towns, the sewerage will contain a greater proportion of fertilizing ingredients than in one that is more thinly so; then again, in a town where the contents of the water-closets are discharged into the drains, with other animal matter, the sewerage will be richer than where there are open privies; another enquiry should be, to what extent is the sewerage diluted with rain water. I am of opinion, that in order to render sewer water generally applicable and useful as a fertilizer, it must be delivered to the farmer of, as near as may be practicable, a standard quality; I mean that it should always contain, in a given quantity, the same proportions of fertilizing ingredients diluted to the same extent, which state of dilution should be that most suitable for direct application to the land. I have no doubt this might be accomplished, partly by chemical analysis in the first instance; and secondly, by such an arrangement of branch drains betwixt the sewerage of a town and the reservoir containing the liquid manure, as would regulate the admittance of water into it during heavy rains. The reservoirs could be so placed as to draw off any portion of the liquid in a sewer in dry weather, when it would be in the most concentrated state, as might be required for the purpose of preparing it for the use of the farmers. Perhaps it might be necessary to have more than one reservoir for the purpose of effecting a more complete chemical union of the several elements contained in sewer water. The various kinds of matter in fresh sewer water are merely suspended, when at rest some portion of it is deposited, other portions are decomposed, gases evolved and fresh combinations take place, and when the union of the several elements is complete, the liquid manure is in the most fit state as food for plants. Sewer water taken directly from its source must be of very variable quality, and uncertain in its effects; and, although in this form a most valuable fertilizer, science may yet do much to render it still more extensively beneficial; but these are mere speculative opinions, the real difficulties of employing the sewerage of towns for the purposes of agriculture will vanish before the chemical and mechanical science of the present age.—*Henry Liddell, Beverley-road, Hull.*

PULVERISATION OF THE SOIL.

The grand object of pulverisation of the soil is to give free scope to the roots of plants, for without an abundance of roots no plant will become vigorous, however rich the soil may be in which it is planted. Pulverisation, therefore, is not only advantageous previous to planting, or sowing, but also during the progress of vegetation of most plants. At this stage the operator, by means of pruning, or cutting off the extending fibres, causes them to send out numerous others, by which such food as is in the soil is the more readily taken up. Pulverisation increases the capillary attraction, or sponge-like property of soils; by which their humidity is rendered more uniform. This capillary attraction is always greatest where the particles of the soil are finely divided. Gravels or sands retain little or no water, while stiff soils, as clays, which have not been opened by pulverisation, either do not absorb water, or when by long action it is absorbed, they retain too much. Water is not only necessary to the growth of plants, but it is essential to the production of extract from the vegetable matter which they contain, and unless the soil by pulverisation is so constituted as to retain the requisite quantity of water to produce this extract, the application of manures would be useless. Water is known to be a condenser and solvent of carbonic acid gas, which is immediately carried by it to the roots of vegetables. The depth of pulverisation must depend upon the soil and subsoil. In rich lands it can scarcely be too deep, and even in sands, unless the subsoil contain particles noxious to vegetables; but very dry sands, if the season is hot and dry, should merely be stirred, otherwise the great evaporation of moisture which would take place by deep pulverisation, would render them too dry for the vigorous growth of plants. By deep pulverisation the temperature of the earth is increased. As earths are bad conductors of heat, it would be a considerable time before the gradual increasing temperature of spring could communicate its genial warmth to the roots of vegetables. It is thus of the utmost importance to have the land open, so that the warm air and tepid rains of spring may have free ingress. Some soils are more readily heated than others, and some soils cool much sooner than others. In general, soils that consist principally of a stiff white clay are difficult to heat, and being usually very moist, they retain the heat only for a short time. Chalks are similar in one respect, they are difficult to heat, but being drier they retain the heat longer. A black soil is readily heated: coloured soils, and those soils containing much carbonaceous matter, exposed under equal circumstances, acquire a much higher temperature than pale-coloured soils. When soils are perfectly dry, those which most readily become heated by the solar rays, likewise cool much more rapidly. Abundance of animal and vegetable matter, when heated to the same degree, will cool much more slowly than a wet pale soil entirely composed of earthy matter. Sir H. Davy found "that a rich black mould, which contained nearly one-fourth of vegetable matter, had its temperature increased in one hour from 65° to 88°, by exposure to sunshine; whilst a chalk soil was heated only to 60°, under the same circumstances; but the mould removed into the shade, where the temperature was 62°, lost, in half an hour, 15°, whereas the chalk, under the some circumstances, had lost only 4°. A brown fertile soil, and a cold barren clay, was each artificially heated to 88°, having been previously dried. They were then exposed to the temperature of 57°; in half an hour the dark soil was found to have lost 9°, and the clay 6°. An equal portion of the clay containing moisture, after having been heated to 88°, was exposed to a temperature of 65°; in less than a quarter of an hour it was found to have gained the temperature of the room."

The moisture of the soil and subsoil materially affects its temperature, and prevents their ever attaining to any great degree of either heat or cold. As before remarked, the power of soils to absorb water depends in a great measure upon the division of their parts; the more divided they are, the greater is their absorbent power. The different constituent parts of the soil likewise appear to act with different degrees of energy. Thus, vegetable substances are more absorbent than animal substances; animal substances more so than compounds of alumina and silica; and compounds of alumina and silica more so than carbonate of lime and magnesia. These differences, however, depend greatly upon the state of division, and the surface exposed. Stiff clays, which absorb the greatest quantity of water when it is poured upon them in a fluid state, are not the soils which absorb the most moisture from the atmosphere in dry weather. They cake, or run together in hard lumps, and present only a small surface to the air, which requires much trouble to reduce to a fine state, and in hot dry seasons the vegetation on them is generally burnt up almost as readily as on sands. The soils which are most efficient in supplying the plant with water by atmospheric absorption are those in which there is a mixture of sand, clay, and carbonate of lime, with some animal and vegetable matter, and which are loose and tight, so as to be permeable to the atmosphere. With respect to this quality, animal and vegetable matter, with carbonate of lime, are of the greatest use in soils; they give absorbent power to the soil without giving it tenacity. Sand, which also destroys tenacity, on the contrary, gives little absorbent power. The absorbent power of soils with respect to atmospheric moisture, is always greatest in the most fertile soils. When soils are immediately situated upon a bed of rock or stone, they dry sooner by evaporation than when their subsoil is of clay or marl. A clayey subsoil will sometimes be of material advantage to a sandy soil; in this case it will retain moisture in such a manner as to be capable of supplying that lost by the earth above, in consequence of evaporation, or consumption of it by plants. On the other hand, a sandy or gravelly subsoil often corrects the imperfection of too great a degree of absorbent power in the true soil. In a moist climate a siliceous sandy soil is much more productive than in dry districts; and, in such situations, Wheat and Beans will require a less absorbent soil than in dry situations; and plants, having bulbous roots, will flourish in a soil containing as much as 14 parts out of 15 of sand. Even the exhausting powers of crops will be influenced by like circumstances; for, by means of pulverisation, the atmospheric air buried in the soil is of essential assistance (by its influence on the food of plants there lying) in the maintenance of vegetable growth. Heat is given out during the chemical processes which ensue, and hence the great propriety of cropping lands immediately after they have been turned over, and this especially if manure has been added at the same time; as the process of fermentation will go on faster when the soil is loose, and the cavities filled with air, than afterwards, when it becomes compressed with its own gravity. The advantage of heat thus obtained in exciting vegetation—whether in respect to seed or roots, especially in spring, when the soil is cold—must be very great.

There is yet an undecided point amongst many farmers relative to the best manner of laying the furrow slice. Some contend for turning it completely over, *i. e.*, laying it quite flat; and others, that it is most advantageous to place each slice in such a manner that its outer edge may extend a little over the inner edge of the furrow which was drawn before it. In my opinion the principal objects in ploughing are, to expose as much as possible to the atmosphere, and lay the land so that the harrow may in the most effectual manner raise the mould to cover the seed; these objects are the more readily accomplished by ploughing land of every description (with the exception of dry sandy soil) with a furrow slice of 7 inches deep and about 10½ broad; the furrow slice will form an angle of about 45°. The depth of the furrow should, in general, bear a due proportion to its width, *i. e.*, about two-thirds, or as six inches deep is to nine broad. The angle 45° is strongly recommended in Bayley's Essay on the "Construction of the Plough," and in Brown's Treatise on "Rural Affairs." Ploughing previous to winter setting in is of great use to stiff clayey lands, exposing the surface to the frost, which mellows and reduces it in a manner infinitely superior to what could be accomplished by all the operations of man; the hollow place between the furrows will carry off all superfluous water, and render the soil, with the action of the winter's frost, fit for tillage earlier in spring. The harrows will also more readily take hold of the soil, and thus a proper mould will be procured for covering the seeds. Should there be danger of the land lying too loose and hollow, repeatedly harrowing, and rolling it with a heavy roller, will furnish a remedy.

Dry sandy soils should not be ploughed in ridges, but be turned completely over and kept as level as possible. Such soils, if rendered loose, and laid light by cultivation will be greatly robbed of their fertilizing particles. It is of the greatest advantage to such soils to fold sheep, or to consume the crops of Turnips upon the ground where they are raised. This practice has now become pretty general over England, as it is found from experience to contribute to the improvement of such soils, not only by the dung and urine thus deposited, but by the consolidation and firmness of texture, which the treading of the sheep occasions. The cultivators of this kind of soil have, therefore, many advantages over those who are engaged in the more stiff and heavy sorts of soils, in being able to perform the various operations of arable husbandry with much less expense, and being less interrupted by a wet and backward season. I have already adverted to deep ploughing, and the results to be derived from it. And, in conclusion, I would remark, that some proportion ought to be observed between the depth of ploughing, the nature of the soil, subsoil, and the quantity of manure annually spread. I have witnessed where old pasture-land of a sandy loam has been broken up in spring for a crop of Oats by subsoil ploughing, that the crop failed. Now, there appears to me two reasons for this failure; in the first case, the subsoil brought to the surface to form the seed-bed had long been deprived of the action of the atmospheric gases, consequently must have been infertile and cold. In the second case, the dry tenacious sward being placed under the seed-bed, the moisture of the soil was quickly evaporated. The grand object of deep pulverisation is to cause the soil to retain heat and moisture, so necessary to the healthy growth of vegetables of every description.—*J. M'Intosh.*

ON THICK AND THIN SOWING.

(*Continued from p. 845.*)

There is a statement of experiments adverse to thick sowing in "Mr. Almack's Prize Essay on the Farming of Norfolk." ("Royal Agricultural Society's Journal," vol. v., p. 354). On which subject I have been favoured with the annexed letter. We must bear in mind it is a light-land district, and the Wheat not dibbled or autumn rolled. "*Sussex Farm, Burnham, Norfolk, June 1, 184*.

"Sir,—I have much pleasure in replying to your letter respecting Wheat-sowing. The experiments to which you refer, and which are reported by Mr. Almack, were made by me for my own satisfaction. I had been for many years in the habit of sowing what is now called a thin seed, 8 or 9 pecks per acre; many of my neighbours sowed from 11 to 13 pecks per acre; and I could not help noticing not only that they were more sure of a plant in the spring, but also had generally a better yield at harvest. The late Lord Leicester was a great advocate for thick seed, even to 4 bushels per acre (no doubt some was required for his game). My father, more than 20 years ago, wished to see a fair trial between his usual quantity of seed (2 bushels) and Lord Leicester's (4 bushels). I superintended that, and the result was in favour of the two. This, and an accidental crop which yielded well from 6 pecks per acre, induced both him and myself to persevere for many years with a thinner seed, until I was induced by my neighbour's continued practice, and my own observation, to try for myself in the two instances reported. I have also had three or four experiments as to the width of the drills, and the result has always been in favour of seven inches. This was so much against my own preconceived ideas that I was not satisfied with less than three decided experiments. I now drill all my Wheat at 7½ inch or five drills to a yard, with 11 pecks of seed before Michaelmas, 12 pecks after: the experiments referred to were at 7½ inch. I attended at the sowing, the reaping, the carting, the thrashing, and dressing—

in every instance, assisting in all the operations. The experiment of 1842 was horse-hoed; there was no apparent difference in the quantity of weeds (which were very few in any part). I never hand-hoe, but generally weed with a hoe if here and there a weed springs up after horse-hoeing. In 1843 the crop was so clean (after Carrots) it was not horse-hoed at all, and hardly a weed in the field. My plan is to horse-hoe as early in the spring as the season will permit, and then (a week afterwards) to roll with a heavy roller before the land becomes dry. This year the Wheat lands are so free from Poppy, that I have hardly occasion to horse-hoe any. I have not perceived any difference in the succeeding crops, between that sown thick and the thin; though if the crop be very thin we are sure to have more and stronger plants of such weeds as do spring up. In the years 1820 and 1821 I had two experiments between dibbling and drilling Wheat; the result in each instance was a little in favour of dibble as to quantity and quality, but in favour of the drill as to net produce; the expense of sowing and cleaning being so much less, and as the chief advantage of the dibbling appeared to be the treading of the soil, we adopted a heavier rolling for the flag, and I think succeeded in the desired result. I have had some very decided results from the effects of rolling in the spring—these and some others you will find reported in the "Prize Essay on the Agriculture of Norfolk," published by the author, R. N. Bacon, of Norwich. Knowing the interest you take in agriculture, I should at any time have pleasure in communicating anything in my power; mine is a light-land farm, and moderate land.

"I am, your most obedient servant, H. E. Blyth."

Thin sown corn should always be sown as forward as possible. It has been stated, and correctly too, that thin sown crops are later than thick sown. This is incorrect, and consistent with the principle, that the more vigorous and perfect the development of a plant, the stronger must be its growth; although this may be remedied by early sowing, an improved condition of the soil by drainage, superior cultivation, and abundance of manure.

In a thick sown crop, the growth of the plant is premature, as shown by the smallness of the ear and kernel, and the deficiency in the number and quality of grains. Time is thus saved at the cost of perfection. The weakness of the stem caused by this prematurity often a ruinous affair in heavy land. The stormy summer rains of 1843, caused several superb-looking fields of Wheat to be laid and nearly destroyed, only producing from 4 to 12 bushels per acre. This was in one small parish, under my own observation. Thin sown, and vigorous stems would not have suffered.

The following gratifying fact proves more for thin sowing, even in a most severe winter like the past, than thousand arguments or opinions:—

My friend, Mr. ———, of Chapel, Halstead, Essex, deposited one kernel of Wheat in each dibble-hole, on one stetch, in a Wheat-field, measuring 1-12th of an acre: the quantity so deposited was exactly one quart, or at the rate of 1½ pecks per acre; of course, during the winter and early spring, it looked miserably thin, but healthy. Now, he will defy any person to distinguish that particular stetch from the rest of the field, although 8 pecks per acre was drilled on the remaining portion. The adjoining field, which received 10 pecks per acre, is inferior to this field, and of course to the 1½ pecks. He is of opinion, from the superior breadth of the flag, that the thin sown stetch will produce the largest quantity and best quality of corn. My manager has inspected this field, and although adverse to thin sowing, acknowledges with surprise he could not detect the thin sown stetch until pointed out to him. Another corroborative fact is, that Mr. Sargeant, of Louth (whose letters are quoted in my book, p. 41), has the finest Wheat in the county from thin dibbling, and this after Potatoes.

I have proved practically on my farm this season that thin sowing in December and January makes the harvest a fortnight to three weeks later in the same field with thicker sown, although both were put in on one day. The produce of the thin sown is estimated to be smaller; but I am not prepared to admit this till the thin sown has reached maturity, when it may, and very likely will excel the thick sown; but the bushel will settle that question. My October thin sown and dibbled corn is admitted to be excellent.

The following will be about the quantities of Wheat I shall sow, having regard to circumstances:—

In August	2 pecks	...	dibbled.
In September	3 ,,	...	dibbled.
In October	4 ,,	...	dibbled or drilled.
In November	5 ,,	...	dibbled or drilled.
In December	6 ,,	...	drilled.
In January	7 ,,	...	drilled.
In February	8 ,,	...	drilled.
In March	12 ,,	...	drilled or broadcast.
In April	16 ,,	...	drilled or broadcast.
In May	24 ,,	...	broadcast.

Of course, to sow Wheat so late as the two last months, would be unusual; but I would avoid the risk of a dry season, by covering the ground as quickly as possible, and prevent tillering, thus economising time. In sowing such extreme quantities, an abundant top-dressing of manure must be added to perfect a crop. Oats or Barley I seldom grow; but I should graduate the quantity according to the period of sowing, following Mr. Hewitt Davis's average in a climate similar to his, for his system is a most excellent one. This season, 1 bushel of Barley dibbled on 1 acre promises to be a good crop.

In northern and late districts, thick sowing presents the very great advantage of forwarding the harvest considerably; I should, therefore, always regulate the quantity of my seed by the period of its deposit, and the nature and condition of the soil and climate. The disadvantage of thick sowing in poor or moderate land is the want of sufficient support to mature each ear, thus causing death to many plants by starvation, whilst the survivors are crippled and debilitated by the contention they have had with their defunct companions, as clearly shown in Mr. Hewitt Davis's Essay. I would always, therefore, as I increased my quantity of seed, take care to supply a corresponding addition of manure, which is easily effected by occasional top-dressings of soot, guano, bone-dust, nitrate of soda, salt of gypsum, in March and April, when vegetation becomes active, and the roots more in search of food.

The quantity of corn to be produced depends not on the quantity of seed sown, but on the amount of food for plants the earth contains. Thick-sown crops require more manure for their perfect development than thin sown. I know a farmer who grows from 6 to 7 qrs. of Wheat per acre, by drilling 3 bushels of seed in October, on strong land very highly manured. I recently examined the crops, which were very level, the ears numerous and evenly developed, the straw not very strong. Such crops suffer occasionally by lodging in a very wet season.

I consider the perfection of Wheat-growing is to produce a full crop of uniformly ripened large well-developed ears, on strong upright stems. The only way to accomplish this is by thin and early dibbling, frequent cultivation between the plants, and abundance of manure. The best crop I know of in Essex is from 5 pecks of Wheat per acre, dibbled in August by Newberry's dibbling machine; it promises to be 7 qrs. per acre. Not many miles from this is a crop from 4, 5, and 6 bushels of seed. The 6 bushels promises to be better than the 5 and 4, but not so good as the one I mentioned from 5 pecks. The saving here is 5 bushels of seed Wheat. Some of my own Wheat looks like 5 to 5½ qrs. per acre. There appears to be an extraordinary clashing of opinions on the subject of thin or thick sowing, which I can only account for by the various circumstances under which the experiments have been tried; for instance, where there is an abundance of game, which would reduce the plant to be a thin one by the spring, it would be injudicious to sow too little, and so it would on undrained heavy land, or on very weedy land. In light sandy lands there is more to be feared from frost, and less risk of a laid crop, such soils being usually deficient in alkalies, which promote the growth of straw. It is said on such soils thick sowing has been found to answer best. I think it is very much in our power to increase the tillering of Wheat in such light lands, by deep dibbling, and consolidation by autumnal and spring heavy rollings.

It would be wrong to expect uniform success in either thick or thin sowings; they must both be subject to the vicissitudes of seasons and variations in soils. It certainly can never be necessary to sow 3 or 4 bushels, as is often done; for this is assuming that each kernel will only produce tenfold. I think the balance of reason and evidence is decidedly in favour of thin sowing. By this means we can economise seed, and keep our land clear of weeds, and in frequent tillage by horse-hoe, at a diminished expense — hand-hoeing being seldom required. Should adverse circumstances cause too thin a plant, how easy to transplant or dibble in the vacancies, or cause an increased branching by a stimulus of manure, or harrowing and rolling.

The facts now required are, the minimum of seed and maximum of distance. Jethro Tull and Lieut. Goodiffe have grown splendid crops at 18 inches from row to row; and if so, 1 peck dibbled, and 1½ peck drilled, may be sufficient; but let us try, compare, and communicate results to each other. It is a curious and instructive fact, that, whenever a farmer has any particular sample of corn he wishes to raise a stock from, he carefully deposits one kernel in each hole, and manages generally to get an enormous increase. It is true, he mostly does this in his garden; but ought not all his farm to be a garden? There is no difficulty in rendering it so; it only requires manure and cultivation, both of which can be had by paying for; and these two items do not increase the rent, tithes, tradesmen's bills, or taxes, although they do increase the profits. I know a farmer who, having a new stock of Tares, dibbled 5 pints, one in a hole, and threshed out 17 pecks (being an increase of 54 for 1) of fine seed; they were podded to the ground. He then dibbled 1 bushel per acre, and the 17 pecks produced 33 qrs. and 2 bushels, being an increase of 62 for 1. If we can obtain an increase of from 54 to 62 for 1 in Tares, surely we are quite safe in calculating 100 for 1 in Wheat, Oats, and Barley. Of course, when any crop is grown for feeding green, it would be wrong and absurd to sow thin, because an early growth is required, and the crops are cut in a premature state. An abundance of seed is in this case desirable.—*I. J. Mechi.*

(To be continued.)

Home Correspondence.

Notes on Matters Discussed at the Witham Agricultural Meeting.—An article appeared in your last week's *Gazette*, headed "Witham," which gave a summary of a running conversational skirmish betwixt several of the members of our agricultural society, at our annual meeting. The matters then talked about are practically important, and one of them, if carried out, as I hope it will be, I will take care shall be noticed hereafter. Mr. Mechi is of opinion, that the very strong, uniformly tenacious clay, in Mr. Hutley's occupation, can be effectually drained at the depth of from 4 to 5 feet. Mr. Hutley is sceptical, but offers the land for the experiment; and Mr. Mechi undertakes to drain it on the terms proposed; so far the parties are agreed. The land in question lies upon the shore of one of the estuaries of the German ocean. Its texture and stubbornness is probably not to be surpassed by any soil in the kingdom. Under the present system of farming, the water is directed from the surface by deep and frequent clean cut furrows. These lands in good condition produce great crops of Beans, Wheat, and Oats, and long red Mangold, after Wheat, which follows Clover, without manure. The seeding is later both in spring and autumn, and the harvest earlier than in light soils inland. Draining these soils to advantage is a "questio vexata" in agriculture, and I hope Mr. Mechi will not "back out" as it seems Mr. Smith has done. *Thick Seeding.*—Mr. R. W. Dixon made, as you have noticed, some remarks upon thick seeding, which is his uniform practice. Some of your readers may think that the crop of 9 qrs. and 7 bushels of beans per acre is a mistake, but it is not so. Mr. Dixon's high farming is well-known here, as well as his careful accuracy in any statements that he may make; and it is also true, that the principal part of his aruble land is in Wheat every other year. He is a deep cultivator with the plough, and his practice is to manure heavily for the Bean crop, but he bargains for no weeds. *Forking.*—In a former Journal* I described the methods we practise with the fork, and since then several of our farmers here, and many elsewhere, have set about it in earnest. All our surplus labourers were thus employed last winter, on lands intended for Turnips and Carrots, and both last year and this testify abundantly the profit of the principle, even in the first result in the root crops. I believe the increased produce is from 5 to 10 tons per acre. On my farm, in a field which I forked last winter, I put in Swedes, without ploughing, except covering the farm-yard manure with a light furrow of 3 inches, and I stored the crop last week, 1050 baskets, each weighing half a cwt. to the acre, which is 26 tons. 8 cwt. The blades of the Turnips were cut off, but not the tops. In another field, forked in the same manner, and which was ploughed three times after forking, I carried 900 baskets per acre, cleaned from blades and tops. White Belgian Carrots, on the same system of farming, without the plough, and without manure after Wheat, yielded 23¼ tons to the acre; the plant was deficient 1 quarter. It is evident that the texture of light soils is improved by deep culture; they become more adhesive, and sustain vegetation and growth better in dry weather. The theory which indicates these advantages is sufficiently obvious to need comment, as well as the character of the soils, which are only to be subject to the system. *Potatoes.*—Your publication has been largely and usefully occupied with this question. I shall not trespass upon your space but with a hint or two. After I took up my Potatoes, I left them in shallow heaps, on fresh ground lightly covered with straw for six weeks; I then picked them a second time over, and removed the apparently sound ones, about 2-3ds, into a dry and covered shed, mixing them freely with fresh burnt turf ashes (of which I happened to have a large quantity), covering them over with the same. Up to this time they remain perfectly dry, and show no indication of decay. The quantity is upwards of 400 bushels, and the sorts are Phillips's Bread-fruit, and the Devonshire Red. My friend Dr. Maclean's new seedling, the "Red Lion," which you have several times adverted to, is one of the best keepers we cultivate, and not easily to be surpassed in quality. I planted in October an acre of Potatoes, the sets whole, and partly damaged by the disease. I had them ploughed in 6 inches deep, sprinkling the sets freely with turf ashes, mixed with one-fourth of rape cake dust.—*Henry Dixon, Witham, Dec. 9, 1845.*

Autumn Planting.—By way of experiment I have adopted the following plan with two sorts of Potatoes, early and late; the Early Prolific, and a very good sort of purple. The rows are 34 inches apart, and the sets (whole) are placed 6 inches in depth. I have drilled Vetches between the rows, which are now above ground. Should I put any covering over the Potatoes? When the Vetches are cut in spring, I intend to plant Potatoes in their place; thus, should the autumn-planted fail, I shall be in time to occupy the ground.—*A. Hancock, Bristol.* [6 inches of loose cultivated soil over the tubers is sufficient protection.]

Farm Capital. — Notwithstanding the ill-natured, and, I have great pleasure in saying, unfounded remark made upon my last letter by "Falcon," I once more venture to tell him that many of his ideas of farming are far from practicable, and his letters written by no means with that good spirit which usually urges one man to advise remedies for evils endured by another. "Falcon," in the *Gazette* of November 22, says, "the farmers are, of all classes of men, the most prejudiced." Do the rapid steps of improvement taken by the agriculturist the last 20 years warrant that assertion? The manner in which "Falcon" proposes sufficient capital to the farmers, viz., by entering into partnerships, is, to a great degree, impracticable; true it is that partnerships have existed and do exist in the country, but did "Falcon" ever know a farming firm to get on well? Partnership may suit very well "grocers, butchers, millers, &c.," where there is only one way of manufacturing their produce, and consequently can be no differ-

* I have no means of referring to the page and volume.

ence of opinion as to the proper way of setting about it. But this is not the case with farmers. How many ever-changing processes are required to produce their commodities? How many operations, impeded by a shower or other circumstance taking place during the temporary non-agreement of the masters, might ruin a crop? Difference of opinion there must inevitably be at times; very frequently, I am afraid, if "Falcon" and any practical farmer were in partnership; the one continually urging the necessity of laying out more money, the other prudently wishing to be as economical as possible. Another circumstance must prevent this system from becoming general, for it is well known to every practical farmer that some time must elapse before any return can take place for extra capital; and then, at first, from only a portion of farm, so that the man who was not able to support his family upon the whole proceeds of a farm, would, by entering into partnership, have to live some time upon half the same, and some time longer upon little more. "Falcon" owns, in the *Gazette* of December 6, that one of his suggestions for the relief of the farmer, respecting the saving of the Potato, was of little use; would it not be better if he were to prove all his remedies before he recommended them to the public?—*E. L., Cambridgeshire.*

Price of Labour in England and Scotland.—In the *Newspaper* of the last *Gazette*, there is an account of the annual meeting of the Great Oakley Farmers' Club, where a great deal of interesting matter was discussed, the most of which is not difficult to understand. There is one passage, however, which has puzzled some of us in this country, and I would thank you or some of your correspondents, who know both England and Scotland, to state why the difference in the price of labour, as applied to agriculture, is so very great between the two countries. The passage I refer to is where Mr. Barker, the chairman, in noticing some remarks made by Mr. Mechi relative to Scotch farming, is made to say that "he thought the reason why the English were able to buy Scotch Oats (the latter being dearer rented), was that labour was much cheaper in Scotland than in this country, they being able to get for 100*l.* as much labour as the English farmer can for 200*l.*" The Scotchmen are certainly well off if the above be true; but it is to be hoped we do not farm so cheaply by pinching either our men or horses. Your setting your readers right will oblige—*A Looker-on, Stirlingshire, N.B.* [Taken in one sense, we should consider Mr. Barker's statement to be simply erroneous, *i. e.*, labourers are not paid so well *generally* in England as Scotland. But it may be true after all in another sense; for one difference between Scotch farming, where it is good, and English farming, where it is inferior, is the skill shown in the former in the application and economising of labour. Thus the number of men and horses employed per 100 acres on an East Lothian farm is not nearly so great as that employed per 100 arable acres in many districts of England, though the former may be the better cultivated of the two].

Agricultural Chemical Almanack.—"Full of errors" it decidedly is not, although I own that the views in one or two instances may be questioned (and in the present progressing state of agricultural chemistry such must be the case), yet I feel convinced that our authorities are such as ought to be fairly entitled to respect. The composition of Barley soil not fit for Wheat I have on the respectable authority of Thaër, corroborated by Cuthbert Johnson, who inserts it without question in his excellent little book, entitled "Agricultural Chemistry for Young Farmers." The constitution of a fertile Wheat soil rests on the authority of Sir Humphrey Davy himself, who, although he does not use the word Wheat in the paragraph to which I owe my information on the subject, yet implies such to be his meaning when he mentions the composition of a soil for the farmer's purpose to be most fertile, when composed as I have given it. The error which had inadvertently crept into the "Almanack" respecting the composition of water could not mislead the veriest tyro in chemistry, as the atomic numbers are close at hand to detect and correct the mistake. The source of uranium was correctly given in my manuscript, and is a typographical error.—*Freeman Roe, 70, Strand.* [Mr. Roe has requested us to insert the above. We must, nevertheless, abide by the opinion we have expressed. A Barley soil, with 68 per cent of clay in it, never existed—taking the word clay in the meaning which would at once be attached to it, *i. e.* as signifying alumina: 12 to 20 per cent. of alumina make a very stiff soil. We do not deny that Wheat may grow on a soil containing 360 (out of 440) parts of carbonate of lime; but to put that down in a formula, expressing the general constitution of "a fertile Wheat soil" is absurd.]

Dog Thistle.—Will any of your correspondents inform me the most effectual way to eradicate the Dog Thistle. A Grass-field is overrun with them. I would willingly employ people to dig them out, but my gardener says that will not eradicate them, as the roots are so deep in the ground they cannot get them up.—*S. S.* [If digging them out will not eradicate them, nothing will.]

Management of Liquid Manure.—On a reconsideration of the subject of my communication of the 4th inst. (see last *Gazette*), it has occurred to me that the object of the invention may be obtained, and the apparatus simplified, by merely inverting the order of the valve and floats, placing the floats and well first, and the valve last. By this arrangement the sluice plate of the former drawing may be dispensed with. It is only necessary to observe that the valve should act at the end of a longer lever than the float, to enable it to close and open more rapidly on a small motion of the float; and the instrument should be so adjusted that the valve should close on its seat just as the water in the drain rises to the edge of the waste pipe, and is about to flow over into it.—*J. H. H.*

Salting Pork.—"D. M." is very sorry that she did not see "Inquirer's" request before to-day, December 13th, or she would have answered it immediately. "D. M." thinks from 10 to 12 lbs. of sugar would be quite sufficient for a large hog; perhaps less. "D. M." should have added, that as soon as sufficient pork had been used out of the tub to admit of it, two heavy pieces of stone or marble were placed upon the pork to keep it from rising up. "D. M." has eaten the pork when it has been 2½ years in the brine. The brine is useful afterwards for the land, but it will not do to be used a second time.—*Dec. 13, 1845.*

Magnificent Auroral Arch and Phenomena.—On Wednesday the 3rd of December, 1845, most unusual and magnificent phenomena were visible in the evening. There had been several heavy snow and hail showers during the day, and many beautiful cumulostrati reared their rocky heads above the horizon in almost every direction. At 5h. two currents of wind were observable by—1st, a mass of cirrostrati clouds moving on the N.W. horizon from the west; and secondly, by a quantity of scud and nimbi rising from the S.W., in a S.S.W. current; occasional hail-stones fell. At half-past 5 faint appearances of Auroræ Boreales were noticed, which increased very rapidly in brilliancy. At 20m to 6h. a dense cirrostratus cloud extended along the north horizon; above this, at an altitude of 15° was another cirrostratus of 5° in breadth, and upwards of 20° in length, parallel to the former one. The space between the two clouds exhibited a great intensity of Auroræ. One broad beam was remarkably brilliant, which covered the breadth between α, β, and υ, ϕ, Ursæ majoris; it consisted of pale silvery intense light. A vivid coruscation passed through θ, Ursæ majoris, of about 30° in breadth; also another, very vivid, through ϵ, Ursæ majoris, of 15° in breadth. Several others were visible but very imperfect and indistinct. The moon was shining dimly. The clouds in the neighbourhood of the Auroræ were rendered black by the phenomenon. 15m. to 6h. the beautiful beam which covered the space between the stars α, β, and υ, ϕ, Ursæ majoris, was exceedingly intense in brilliancy. Although so near the horizon the sky was very considerably illumined by it; indeed, more so than by the moon. 10m. to 6h. a very decided coruscation passed through the stars, α and β, Ursæ majoris, and λ Draconis, and extended within 5° of α, Ursæ minoris; this coruscation, from the circumstance of its passing through the pointers, seemed to offer a favourable opportunity for comparison. Another coruscation passed through λ, μ, and ϕ, Ursæ majoris, and a 3d through λ, θ, and ι, Canes-venatici; these coruscations were about 18° in breadth. The moon at this time was perfectly obscured by clouds. 7m. to 6h., the Auroræ not so brilliant; but was 10° nearer the zenith; the most intense part was the coruscation that passed through λ and θ, Canes-venatici; this had extended to α, Draconis. 6m. to 6h., the sky in the neighbourhood of the Auroræ had become overcast; therefore, although occasional coruscations were noticed, still no stars were visible by which to mark them. The north horizon was still very bright, and the light assumed the shape of a half wide portion of an arch; this continued visible until 20m. to 7h., when the sky was overcast, and snow fell, and continued to fall until half-past 7h., when there was a break in the clouds in the N.W., and the Auroræ again were visible and brilliant, but no coruscations were seen. There was no change until 7h. 55m., when the phenomenon became much more brilliant, and a coruscation passed through $\alpha, \beta, \gamma, \delta$, Delphini, through ι, Pegasi; this remained visible 2 minutes. At 8h. 18m., a most magnificent phenomenon was visible, viz., an Auroral arch; when first discovered it was at its maximum brightness, and of a somewhat orange colour; the light it emitted was very strong; in fact, although the moon was setting, the night was quite light; its average breadth was 5°, and it extended the whole of the way from W. by S. horizon to E. by N. horizon, and was of an almost equal breadth the whole arch; the stars appeared perfectly bright through this phenomenon; at least those of the 1st, 2d, and 3d magnitude did. The flickering light had a rapid cymoid motion from West to East when first discovered; but at 8h. 27m., when the arch was declining in brightness, it had a reverse motion; this was very apparent. At 8h. 23m. the phenomenon passed through and near the following stars:—(5° north of the moon), through the head of Aquarius; (3° north of Saturn, 13° north of Mars), through ξ, 31, and α, Pegasi, ζ and η, Andromedæ, α and λ, Arietis, 10° north of Jupiter through 64, Tauri, (3° north of Pleiades, 30′ north of β, Aurigæ), crossing the Via lactea, κ, Aurigæ, κ, Gemini (3° S. of Pollux). A falling star fell from the Constellation Cygnus through the phenomenon at α, Pegasi, which left a trail of light behind it for the space of one-second; the light where it crossed the Auroral arch became instantly more brilliant, and remained visible a moment longer in the arch than anywhere else, and vanished about 5° beyond the Auroral arch. Many other falling stars were observed during the evening, but no other crossed the phenomenon; 8h. 24m., the auroral arch very brilliant, but of a silvery colour; it had moved 1° nearer the Pleiades; 8h. 25m. the arch separated, and formed into two bands of about 2° 30′ each, becoming nearer the S.E., the Pleiades were in the space between the two bands; 8h. 26m. the phenomenon had become less brilliant; 8h. 27m. a portion of the arch was separated from the rest, near κ, Gemini; the eastern portion remained nearly motionless, whilst the other had moved nearly a degree nearer the S.E. 8h. 30m., the arch was now very faint, although perfectly [illegible] fined; 8h. 32m., sky suddenly overcast from the [illegible] and a snow-shower came over which lasted near [illegible] minutes; when the clouds cleared off a very faint [illegible] tion of the arch near Jupiter could be detected. The thermometer was 31° when first the phenomenon was discovered, afterwards 30·5°. During the whole of the time the phenomenon was visible, and indeed all the north horizon was illumed by what I took [illegible] reflection of very brilliant Aurorae below the [illegible] This must have been very magnificent in a lower tude. A comparison of remarks might prove useful science, therefore I give the latitude and longitude Highfield House, which is—lat. 52° 57′ 30″ N.; 1° 10′ W.; and 4′ 38″ slow of Greenwich time. Any one having recorded the above phenomenon would greatly oblige me by forwarding a duplicate.—*S. Lowe, Highfield House, near Nottingham, Dec. 5*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY Council was held at the Society's House in Hanover-square, on Wednesday last, the 10th inst. present—the Right Hon. Lord Portman, President, in the chair; T. Raymond Barker, Esq.; S. Benner, Esq.; W. A. Browne, Esq.; F. Burke, Esq.; Dr. Calvert, F. C. Cherry, Esq.; J. W. Childers, Esq., M.P.; J. Bell Crompton, Esq.; W. Fisher Hobbs, Esq.; W. H. Hyett, Esq.; S. Jonas, Esq; J. Kinder, Esq.; G. Kimberley, Esq.; W. Miles, Esq., M.P.; R. Milward, Esq.; P. Pusey, Esq., M.P.; Professor Sewell; W. Shaw, Esq.; C. Stokes, Esq.; H. S. Thompson, Esq.; G. Turner, Esq.; T. Turner, Esq.; J. L. Wright, Esq.; J. Wood, Esq.; and T. Tweed, Esq.

The following new Members were elected:—

Headlam, Thomas Emmerson, Mayor of Newcastle-on-Tyne
Potter, Addison Langborn, late Mayor of Newcastle-on-Tyne
Pulleine, James, Crakehall, Bedale, Yorkshire
Parker, Harrington, Parbold Hall, Standish, Wigan, Lancs.
Twining, F., Parbold Hall, Standish
Cotton, Michael George, The Terrace, White-hart-lane, Tottenham
Carrol, Hutchinson, Tulla House, Nenagh, Co. Tipperary
James, Thomas, Brandon, Wooller, Northumberland
Milne, Oswald, jun., Prestwick Wood, Manchester
Merest, Charles William, The Priory, Fornham, Bury St. Edmunds
Thorp, Thomas, Alnwick, Northumberland
Stent, Bridger, Hastings, Sussex
Martinson, Edward, Hedgefield, Newcastle-on-Tyne
Carr, William Cochrane, Blagdon, Newcastle-on-Tyne
Carr, John, Roseworth, Newcastle-on-Tyne
Cowen, Joseph, Blagdon Burn, Newcastle-on-Tyne
Bell, Christopher Seymour, Cumberland Road, Newcastle-on-Tyne
Cookson, Isaac, Meldon Park, Morpeth, Northumberland
Reed, Nicholas Ridley, Byruess, Redesdale, Jedburgh, N.B.
Laycock, Robert, Wenlaton, Newcastle-on-Tyne
Laycock, Richard, Wenlaton, Newcastle-on-Tyne
Brown, Rev. B. G. S., Vicar of Atwick, Hornsea, Yorkshire
Parker, Rev. William, Rector of Little Comberton, Pershore, Worcestershire
Vere, John, Carlton-on-Trent, Newark, Notts.
Phillott, Edward Pender, The Clevelands, Dawlish, Devon
Creswell, A. J. Baker, M.P., Creswell, Morpeth, Northumb.
Bell, Thomas, Newcastle-on-Tyne
Anderson, Joseph, Whitley, Tynemouth, Northumberland
Anderson, William, jun., Newcastle-on-Tyne
Potts, Timothy, Rising Sun, Long Benton, Newcastle-on-Tyne
West, Captain, R.N., Jesmond, Newcastle-on-Tyne
Spoor, Richard, Whitburn, Sunderland, Durham
Cornewall, Sir Velters, Bart., Moccas Court, Hereford
Rees, Rees Edward, Packington, Newport, Monmouthshire
Dyke, J. D., Glovers, Sittingbourne, Kent
Hutchison, John Monyruy, Peterhead, N.B.
Bennet, Philip, jun., M.P., Rougham Hall, Bury St. Edmunds
Drummond, Dr., 103, Gloucester-place, Portman-square
Stagg, Thomas, Great Bedwin, Wiltshire

The names of 14 candidates for election at next meeting were then read.

Mr. WOODWARD, of Little Comberton, transmitted to the Council a memorial from the city of Worcester, soliciting the Society to hold its Country Meeting of 1847 at that place; and the various plans and [illegible] formation required by the regulations of the Council being at the same time duly forwarded, the whole of these papers were referred to the monthly Council in April.

Earl SPENCER and Mr. MILES, M.P., submitted to the Council the various specimens of results obtained in making the trial of the Southampton and other Wheats as judges selected for that purpose. Mr. Lister Maw presented specimens of the Belgian Carrot, grown on his farm at Tetley, along with a statement of the circumstances under which they were cultivated. Mr. Cuthbert Johnson suggested, in a letter to the President, a minute chemical examination into the cause of the failure of the Clover crop on certain soils, where formerly that crop was grown with perfect success by their present cultivators. The committee on the analyses of the ashes of plants, were requested by the Council to favour them with a report on the actual state of that investigation. Mr. G. Turner submitted various papers and models to the inspection of the Council. The Council then adjourned over the Christmas recess to the first Wednesday in February.

A SPECIAL COUNCIL was held on Friday, the 12th of December. Present: the Right Hon. Lord Portman, President, in the chair: T. Raymond Barker, Esq.; F. Burke, Esq.; H. Blanshard, Esq.; W. A. Browne, Esq.; G. Kimberley, Esq.; J. Bell Compton, Esq.; J. A. Ransome, Esq.; R. Milward, Esq.; J. Morton, Esq.; and W. B. Wingate, Esq. The Esq.; Prof. Sewell;

Council took into consideration and unanimously agreed to their Report to the General Meeting.

General Meeting.—The December General Meeting of the Society was held at the Society's House, in Hanover-square, on Saturday last, the 13th instant. The Right Hon. Lord Portman, President, in the chair:

The Secretary, by direction of the President, read the following report from the Council:—

REPORT.

The Council have to report to the members at their present general meeting the result of their consideration on the three following principal subjects during the past half-year, namely:—

1. The Annual Country Meetings;
2. The Finances of the Society; and
3. The Potato Disease.

Annual Country Meetings.—The following comparative statement of the entries of stock and implements at each of the country meetings already held, and of the amount of receipts and expenditure on each occasion, will furnish, at a single view, the requisite data for estimating the extent of the several meetings, and their respective charge on the general funds of the Society:—

Entries.

	Stock.	Implements.	Receipts	Expenditure.	Excess of Expenditure
			£	£	£
1839, Oxford	249	23	2394	2688	294
1840, Cambridge	352	36	3416	3589	173
1841, Liverpool	319	312	4106	5052	946
1842, Bristol	510	455	4202	4775	573
1843, Derby	730	508	3390	5090	1700
1844, Southampton	575	948	4929	5736	807
1845, Shrewsbury	437	942	3662	5166	1504

It will be seen by this statement that the last Country Meeting of the Society, held at Shrewsbury, exceeded the first Meeting, held at Oxford, by double the entries of stock, and more than 40 times the entries of implements; while the expenses required at the Shrewsbury Meeting, to provide the increased amount of accommodation, have been only double those of the Oxford Meeting. But the number of persons who visited the Show-yard at Shrewsbury being, from local causes, much less than at Oxford, a heavy excess of expenditure over the receipts at the Shrewsbury Meeting has become chargeable on the funds of the Society. If, however, the multitudes who had thronged the former Country Meetings, in localities more accessible and more thickly populated than that of the North Wales District of the Society, in which Shrewsbury is situate, were wanting at the Society's recent Country Meeting in that town, the Council feel that a great principle of the Society has been carried out, in having held one of their Country Meetings in a district purely agricultural, remote from opportunities of direct information as to means of improvement, of personal inspection of the various breeds of stock, and of the peculiar character of the implements of distant districts. While, however, the assemblage that formed the Shrewsbury Meeting was less than on previous occasions, it comprised within its numbers a large proportion of the most eminent agriculturists from every part of the kingdom, including distinguished foreign visitors, and a deputation from the Duchy of Mecklenburg Schwerin: the splendid exhibition of Hereford cattle, and the quality of the show generally, both of stock and implements, constituted an exhibition fully equal in merit and intrinsic excellence to the more numerously attended meetings of previous years. The trial of Implements, both at Shrewsbury, and subsequently at Pusey, in Berkshire, has proved highly satisfactory to the Stewards and Judges of that department, who have, however, reported to the Council that the trial made on the spot, and at the time of the meeting at Shrewsbury, was fully adequate to the purpose, and might have spared the delay, expense, and trouble occasioned by a subsequent trial. In acknowledgment of the obligations which the Society owed to the Mayor and Corporation of Shrewsbury; to Mr. Isaac Taylor, of Monkmoor; to Mr. Pusey, M.P.; to the Railway Companies, and to the Commissioners of Police, the Council have transmitted to those parties respectively a vote of their best thanks.

The Council have appointed Committees for taking into consideration the following questions respectively referred to them:—

1. For recommending the best method of providing for the personal accommodation of the Judges, and for regulating the future rate of remuneration for their services.
2. For reporting to the Council the most suitable rotation of districts, to commence in 1848, for the Annual Country Meetings of the Society, to be adopted on the termination of the present schedule which ends in 1847; and
3. For ascertaining, in conjunction with the legal advisers of the Society, the security to be provided in future against alleged infringement of patent rights, in making use of implements selected by the Judges for trial.

The Cattle Prize Sheet for the Newcastle meeting, as arranged in the month of June last according to the bye-law, in which an increase is made in the amount of the principal prizes, has been already published; the list of prizes to be offered for implements at Newcastle has also been arranged. The Council are gratified to find, from the numerous applications received from various parts of the kingdom, soliciting the Society to hold its country meeting in each of their respective districts, that the effects resulting from the system of a succession of districts adopted by the Council have not only proved to be of a most practical and beneficial character, but that they are duly estimated by the country at large. For the accommodation of the exhibitors, they have decided on further arrangements to be made with the auctioneer at the sale of stock; and in order to enable the consulting-engineer to have increased facilities for drawing up his report on the exhibition and trial of implements, they have released him from the duties of acting as a judge, for the purpose of allowing him to devote his attention more exclusively to a detailed examination of the principles, construction, and practical working of the implements exhibited.

The Council have received from the Judges appointed for the trial of Wheat selected at the Southampton Meeting, their respective reports on its cultivation, along with other local varieties, which will appear at length in the ensuing Part of the Journal now on the eve of publication.

The Committee having reported to the Council that unexpected difficulties had arisen in effecting the analyses of the ashes of plants, for which the Council had voted a sum of money, the Council have requested the Committee to ascertain the actual state of the investigation, and favour them with a report on the subject.

Finances.—The following statement of the amount of members, income, and expenditure, from the year of the Oxford meeting to that of the Southampton inclusively, will show the corresponding relation of each of these particular heads of enquiry during the period of the Society's past history:—

	Members.	Income.	Expenditure.
1838	2172	£7446	£6041
1839			
1840	4262	5001	4040
1841	5382	6028	5150
1842	6500	6256	5690
1843	6903	7307	6906
1844	6827	9291	9070

The arrears of subscription at the present time are as follows:—

1841	£ 386
1842	636
1843	1141
1844	1702
1845	2927
Total	£6802

The total number of members in arrear is 2902.

£1915 having been discharged from the arrear account since the last general meeting in May. Since that date 264 new members have been elected, 42 have died, and 316 been struck off the list; and the Society now consists of the following members:—

Life Governors	94
Annual Governors	198
Life Members	527
Annual Members	5899
Honorary Members	15
Total	6733

The Council having ordered the list of the Society to be printed for the use of the members, it is now in the press, and will appear with the ensuing Part of the Journal. The members of the Society who receive the List and Journal would render effective service to the Society, if they would inform the secretary of any errors in the List.

Potato Disease.—His Grace the Duke of Northumberland, one of the vice-presidents of the Society, having placed at the disposal of the Society the sum of 100*l.*, to be appropriated to such purpose for promoting the objects of the Society as the Council might decide; the Council, with the Duke of Northumberland's entire concurrence and approval, have resolved to divide this donation into three prizes to be offered for the best essays on the Potato disease and its history, such essays to be sent in to the secretary of the Society by the 1st of June, 1846. The prize essays being reserved for announcement and reading at the Newcastle meeting, namely:—

Prize of 30*l.*, for the best essay on the remedy for the Potato disease, and on its treatment in the various stages of its planting, growth, and preservation.

Competitors for this prize will be required to furnish information under the following heads:—

1. An account of the growth of the Potato during the last year, with reference to the nature of the season.
2. The nature and cause of the disease.
3. The remedies for the disease; explaining the principles on which the remedy is founded.
4. The treatment of the Potato in planting, both from the tubers and from the seed, and in various stages of its growth.
5. The mode of pitting and preserving Potatoes in ordinary seasons, with the principles upon which any improved plans may be founded.

Prize of 20*l.* for the second-best essay on the same subject.

Prize of 30*l.* for the best history of the disease at the present time affecting the Potato; involving a condensed detail of facts developed by experiments.

Competitors for this prize will be required to furnish information on the following points:—

1. The history of the disease in the Potato in Great Britain, with particular reference to authentic returns regarding any peculiarity of season or seasonal variations.
2. On the methods for retarding the progress of the disease.
3. On the methods proposed for extracting the nutritive ingredients of diseased Potatoes.

Dr. Lyon Playfair, the Consulting-Chemist to the Society, having kindly consented to deliver two lectures on the Potato disease before the members, on the occasion of their present general meeting, the Council, at the suggestion of the Journal Committee, directed all papers on that subject to be submitted to Dr. Playfair's inspection previously to their future consideration by that Committee; and the Royal Institution of Great Britain having liberally placed their theatre at the disposal of the Council, for the delivery of these lectures, the President, in the name of the Council, and on behalf of the Society, has expressed to Dr. Lyon Playfair his best thanks for the important practical lectures delivered to the members on that occasion; and to the Managers of the Royal Institution of Great Britain his best thanks for the favour they have shown to the Society, by the courtesy and liberality of the grant of their theatre, and their cordial co-operation in thus aiding the Society in the prosecution of its objects of public utility.

The Journal Committee, since the last General Meeting, have reported the following awards of Prizes for Essays:—

Mr. O. O. Roberts, of Bangor, North Wales; Lord Kenyon's Prize of 20*l.*, for the best Essay on Gorse as the food of Cattle, Horses, and Sheep.

Mr. John Roals, of Brendon Farm, Wivelscombe, Somerset; the Society's Prize of 20*l.*, for the best Essay on Catch-Meadows.

The House Committee have reported the execution of the various alterations and repairs required in the Society's House; the progress of the plans for the arrangement of the specimens of Wheat, and of the models and implements presented to the Society; and the completion of alphabetical and classed catalogues of the books in the library.

A vacancy having occurred in the list of the Trustees of the Society, by the lamented death of John Charles Earl Spencer, the Council, in unanimously electing Frederick Earl Spencer to fill that office, have availed themselves of that opportunity of recording on their minutes an expression of their sincere regret at his loss, and their deep sense of his private virtues, and of the valuable services he had so uniformly and unwearedly rendered to the Society in promoting every practical object connected with its welfare, and the general advancement of agricultural improvement. They have elected Mr. Grey, of Dilston, a Member of the Council, in the vacancy caused by the transfer of Frederick Earl Spencer to the list of Trustees.

The Council beg, in conclusion, to congratulate the members on the steady progress of the Society in the advancement of its various objects; and on the distinct evidences, throughout the country, of the impulse given to the national cause of agricultural improvement by its movements. They are more and more convinced, as their labours proceed, that, in every attempt to establish sound principles of practical agriculture, the indispensable necessity exists of combining the application of abstract reasonings with a careful collection of facts, aided by that discussion of the rich store of practical experiment to which every member of the Society, from within the sphere of his own local observation, has it in his power more or less to contribute, and especially at the weekly Councils, which will be held as usual, during the session of the Society, from February to August.

By order of the Council, James Hudson, Secretary.

On the motion of the Rev. Mr. Warren, seconded by Mr. Umbers, this report was received and unanimously adopted.

Mr. Raymond Barker, Chairman of the Finance Committee, then read the report of the auditors, from which it appeared that the total receipts during the first half of the present year (including the Christmas balance), had been 7086*l.* 18*s.* 11*d.*, and the total expenditure during that period (including the purchase of 500*l.* stock), 3169*l.* 18*s.* 2*d.*, leaving a current cash balance of 3917*l.* 0*s.* 9*d.* He also read to the meeting the balance sheet of the Shrewsbury meeting, showing the receipts on that account (including the subscription of 1000*l.* from the town of Shrewsbury), to have been 3661*l.* 12*s.* 2*d.*, and the payments up to that date, 5166*l.* 3*s.* 9*d.*, leaving an excess of expenditure over the receipts on that occasion of 1504*l.* 16*s.* 7*d.*, which had been already paid out of the general fund of the Society in addition to the amount of prizes awarded at the Shrewsbury meeting.

The following resolutions were carried unanimously:

1. On the motion of the Duke of Richmond, seconded by Mr. Fisher Hobbs, That the best thanks of the Society be given to the judges at the Shrewsbury meeting.
2. On the motion of Mr. Browne, seconded by Mr. Burke, That the best thanks of the Society be conveyed to Dr. Lyon Playfair, for the lectures with which he had favoured the Society on Wednesday and Thursday last.
3. On the motion of Mr. Ransome, seconded by Professor Sewell, That the best thanks of the Society be conveyed to the managers of the Royal Institution of Great Britain, for the liberal grant of their theatre for the delivery of Dr. Playfair's lectures.
4. On the motion of Mr. Divett, M.P., seconded by Mr. Hillyard, That the best thanks of the Society be given to the auditors, Mr. Tawney, Mr. Hampden Turner, and Mr. Thomas Knight, for their care in auditing the Society's accounts.

The auditors having then been re-elected for the year ensuing, Mr. Pusey, M.P., at the request of the meeting took the chair; when it was moved by Mr. Divett, M.P., and carried by acclamation, "That the best thanks of the Society be given to Lord Portman, for the valuable services he had already rendered to the Society as its President, and for his conduct in the chair at that meeting." The President having suitably acknowledged this unanimous expression of the thanks of the Society, Mr. Pusey left the chair and the meeting broke up.

The Meetings of the Council stand adjourned over the Christmas recess to the first Wednesday in February.

In the Report of Dr. Lyon Playfair's second lecture, our reporter has fallen into an error in making Dr. Playfair state that "there was no prospect of obtaining sound Potatoes from abroad for seed." From the following extract from Dr. Playfair's manuscript lecture, it will be seen what is really the case in this point. There are Potatoes to be had abroad, but not enough:—"I the more impress upon you the necessity for taking care of seed, from the circumstance that we

can look only for a very limited supply from abroad. At the request of the Commissioners sent to Ireland, the Government ordered consular returns to be made; and I have authority to state my opinion of those which I have seen, although all have not yet been received. With the exception of Gallicia, from whence a considerable quantity might be obtained, and perhaps from Bourdeaux, although that is more questionable, we cannot look to foreign sources for supplying the deficiency. Now, as Professor Lindley has shown the enormous quantity which would be necessary for seed (800,000 tons, on his calculation, if all Ireland required new seed), you will see the urgent necessity of looking to yourselves, and taking all the care you can, and not resting upon foreign supplies."

Farmer's Clubs.

Darlington: *Dec.* 8.—*The Best and Cheapest Mode of Keeping Draught Horses during Winter.*—Mr. Walton, Vice-Chairman. Mr. Trotter said: I have paid some attention to the subject of keeping draught horses during winter for some years past, but for the last three years I have adopted quite a different mode to what I previously followed. My method formerly was to allow my draught horses each 2 bushels of Oats per week, together with 1 bushel of Beans and as much hay as they could eat, generally Clover-hay; but for the last three winters I have fed them almost entirely on cut Oat-sheaf, cut into half-inch chaff, which to me has been a very great saving. In an Oat-crop of about 40 stooks per acre, which might yield near 60 bushels, the feed of a draught horse averages 2 sheaves per day, or 14 sheaves per week, which would be about a bushel and 3 pecks per week, if they had been thrashed out, which is a saving of a peck of Oats per week each horse, from what I formerly gave them; besides, I save the bushel of bran per week, and the Clover-hay, which was a very considerable item; for draught horses, you are aware, gentlemen, when they get three feeds of clean Oats in a day, when at work, they will eat a great quantity of Clover-hay besides. Now, when I first changed my mode of feeding from corn and hay to cut sheaf, the horses improved in condition wonderfully, thus showing that it suits them well. In very busy seasons, when they are very hard worked, I allow them half a peck of Oats at dinner-time besides the cut sheaf. Last winter I had only 18 acres of Oats; those kept 12 draft horses, besides four young horses occasionally. This quantity of Oats would not have served me through the year, had I not pursued this system of feeding. The mode I have adopted of preparing the cut sheaf is this: I have my straw-cutter to work from the horse-wheel of my thrashing-machine, and I generally have as much cut in one day as will serve 12 draught horses for near a month. One man attends to and feeds the cutter with the Oat-sheaves, whilst another man carries the cut sheaf into the granary ready for use, when it is taken to the stable in bags as required.—At the close of Mr. Trotter's remarks, a rather lengthy discussion ensued on the subject, but upon the whole it appeared that Mr. Trotter's mode was much the cheapest. The Secretary also read an extract from the Highland and Agricultural Society's Transactions, by Mr. Carmichael, in which he says, in speaking of the draught horses of the clayey districts of Scotland, that—"In the winter months each horse has a daily mess, or mash of boiled or stewed (not steamed) Bean-chaff, mixed with light corn and small Beans, separated by the winnowing-machine, or sieve, from the best grain, to which a few Turnips and a portion of salt are added, with just enough of water to secure the boiler from injury, whilst the whole is being reduced to a pulpy state, and the pulp is then put into one or more troughs, to remain till the evening, when the mash is divided among the horses at a temperature of about blood-heat, immediately on their return from the yoke. This, with Bean-straw, and the additional allowance of one feed of inferior Oats and Beans in the morning, and one at mid-day, when constantly employed, keep the horses in best possible condition." At the conclusion of the meeting it was resolved that from the statement of Mr. Trotter, it appears that his mode of feeding draught horses is much more economical than the methods usually practised, therefore it is desirable that it should be more generally adopted.

Miscellaneous.

Northumberland Hind System.—"The manner of hiring and paying hinds, or farm servants who are householders, in the north of England, is as follows:—Each man is provided with a cottage* and small garden upon the farm, free of rent, for himself and family; several of whom, in many cases, are engaged for the year upon the farm as well as himself. The wages of the hind are chiefly paid in kind: those of his son or sons, if he has any able to work, either in money, or partly in money and partly in grain, as best suits his convenience; but it is generally an object with him to have such a proportion of the earnings of his family paid in kind as will keep him out of the market for such articles as meal, Potatoes, cheese, bacon, milk, &c.; and notwithstanding what the economists say about money being the only proper medium of exchange for labour, as well as other things, the custom of paying farm labourers in kind works well for both master and servant. In times when grain sells at a high price, the conditions of the hind will cost his master more than the ordinary rate of wages for day labourers at the same season; but, on the other hand, in times of great depression, the conditions are the same, though at such times the farmer would be compelled to sell nearly double the produce to enable him to pay his labourers in cash. He has also a benefit in paying for his labour in an article which otherwise would cause him some expense in sending to market, and in disposing of which he might incur the risk of making a bad debt with his corn merchant. The conditions of a hind (I adhere to the local term), vary with the price of grain from 30*l.* to 40*l.* a year; and, at the present prices, are as under:—

36 bushels of Oats	.. .. ..	..	£6 12 0
24 do.	Barley	..	5 12 0
12 do.	Peas	..	3 0 0
3 do.	Wheat	..	1 5 0
3 do.	Rye	..	0 15 0
36 to 40 do.	Potatoes	..	2 14 0
24 lbs. of wool	.. .. ..	..	1 0 0
A cow's keep for the year	.. ..	£8 to 9	0 0
Cottage and garden	.. .. ..	..	3 0 0
Coals carrying from the pit	.. ..	..	2 0 0
Cash	.. ..	..	4 0 0
			£38 18 0

In 1841, 36*l.**

Each hind being bound to supply the labour of one woman (or boy) whenever the farmer requires it, at 1*s.* per day in harvest, and 10*d.* per day at other seasons. The other females of the family receive 10*d.* or 1*s.* a day generally, and 2*s.* 6*d.* in harvest. The food of the peasantry in the north of England, as in Scotland, consisting chiefly of porridge made of oatmeal with milk, for breakfast, and bread, made with Barley and Pea-meal mixed, regulates the above proportions to the demands of a family. Were the same mode adopted in the southern districts, although they could not probably get a more wholesome food, yet the kinds and proportions of grain would have to be regulated by the taste and habits of the people. These 'conditions' are proved, in innumerable instances, to be adequate, under a proper economy (which economy the system has a tendency to produce), to the support of a man, his wife, and any ordinary number of children; for the eldest are probably earning, at the same time, from three or four to eight or nine shillings per week; and the joint produce of their labour, under the management of a frugal housewife, renders their cottage a scene of comfort and contentment. It often happens, indeed, that a hind, with but few in family, has, at the end of the year, a good deal of corn to dispose of, for which, of course, his master is always willing to give him the market price. The grain given to the hind is always of the best that the farm produces. He is paid in advance at the beginning of each quarter, a fourth part of his conditions. It is sent to one of the many small mills which abound in the country, and ground at a cheap rate into the different kinds of meal; and thus the intermediate profits of retail dealers, meal-sellers, and bakers are saved to the consumer; and the corn, which would cost the farmer 16*l.* to pay his hind, is more valuable to the latter than 20*l.* paid in money wages, to be expended in stones of meal or quartern loaves at the end of each week. One very obvious benefit arising to the hind from this mode of paying in kind, besides that of having a store of wholesome food always at command which has not been taxed with the profits of intermediate agents, is the absence of all temptation, which the receipt of weekly wages, and the necessity of resorting to a village or town to buy provisions, hold out of spending some part of the money in the ale-house which ought to provide for the wants of the family; and to this circumstance, and to the domestic employment which their gardens afford in their leisure hours, we are probably much indebted for the remarkable sobriety and exemplary moral conduct of the peasantry of the north. The produce of his garden, his small Potatoes, and the refuse of his dairy, enable the hind to fatten two pigs in the year. The keep of a cow, supplied entirely by his master, consists of pasturage in summer, and a ton of hay, or an equivalent in Turnips, generally ten cart-loads of white Turnips, or five of white and three of Swedes, and as much straw as he chooses in winter. This is reckoned to cost the farmer 8*l.* or 9*l.*; but if the cow be a good one, it is evident that the advantage must be much more than that to a family. The calf, if early in the season, sells for 40*s.*, or thereabouts; if later, perhaps for 30*s.*; and if the good wife be a frugal manager, she will sell 40*s.* or 50*s.* worth of butter, besides an ample supply of milk and cheese for the use of the family. The wool received gives employment to the females, to spin and knit it into stockings in the winter evenings, or it is sent, after being spun into yarn, to be made into blankets. In this way habits of industry and economy are promoted, and domestic and social virtues engendered and preserved, in a manner and to an extent unknown in those districts where the younger members of a family are early driven from the shelter of their paternal roof and the control of a parent's eye; or where the parents, deserted by their children, are forced to take refuge, under the infirmities of age or the pressure of want, in the corrupting atmosphere of a parish workhouse."—*Mr. Grey, of Dilston, in the "English Agri. Soc. Journal."*—[*To be continued.*]

How to Save Oats.—However humble our situation, we may all of us at times be able to throw out some suggestion which may tend to the general weal; and as you are always willing to lend the powerful aid of your journal in making known whatever is, or seems likely to tend to a general benefit, I have made bold to offer to the keepers of horses, through the medium of your columns, a plan which I have successfully practised for the last three years to save a large consumption of Oats; and having had the management of upwards of 200 horses belonging to the Hammersmith Conveyance Company, I can confidently state that the plan is not only a great saving in expense, but in the highest degree conducive to the health and the development of the capabilities of the horse. At this season of the year I lay in a sufficient store of either white or red Carrots (white preferred) to last till the spring, and from every stud of eight horses I deduct from their daily allowance of Oats (which is 4 bushels, or 152 lbs.), 1 bushel, or 38 lb., in place of which I substitute about 72 lbs. of Carrots sliced thin, and then mixed with the chaff and Oats, thus saving 1 bushel of Oats in every stud per day. Now, taking the number of horses working in the omnibuses round London at eight per omnibus, and the number of omnibuses at 1400, the saving in the consumption of Oats by omnibus horses only would be 1400 bushels, or 175 quarters, per day. But almost all descriptions of horses do well upon this food. Blaine, in his "Veterinary Art" (pp. 94, 95), says, "Agricultural horses may be supported on them wholly, when sliced and mixed with chaff; the sweet Parsnip has similar properties, and may be used with almost equal success, and the Swedish Turnip has proved an excellent food, the sugar predominating in all these to an eminent degree;" and he adds, "but Carrots stand foremost, and hardly too much can be said on their excellent qualities; they appear particularly favourable to condition, as the skin and hair always look well under their use; they are highly nutritious, and so favourable are they to the free exercise of the lungs, that horses have been found even to hunt on them, and, in conjunction with a certain portion of corn, would form as good a food as could be devised for our coach and machine horses and our hacknies;" and further on he states, "that in very many cases of horses in fair work, Carrots may be wholly substituted for corn, provided the quantity be doubled or trebled; and with additional advantage to the health and condition of the animals." In the "Museum Rusticum" is an account of two hunters fed with Carrots and small loaves made of Barley, and these horses were said to be the pride of the field. The saving, therefore, if carried out only partially by all who keep horses, would be immense, as I have shown the quantity saved by omnibus proprietors round London only would be 175 quarters per day, or 1225 quarters per week. Blaine's theory I have carried out into practice extensively, and am continuing to do so, and find it not only beneficial, but economical. The partial failure of the Potato crop, and the scanty supply of Oats coming to hand, will, I trust, be a sufficient justification for my humbly endeavouring at such length to point out, *pro bono publico*, how an immense saving may be made in an article the short supply of which is being and will be severely felt.—N.B. A ton of Carrots is equal to 4 quarters of Oats, consequently every ton of Carrots thus used saves 4 quarters of Oats to the country.—*R. G. Durham; Turnham-green, Nov.* 8.—[*To the Editor of the Times.*]

Notices to Correspondents.

Blindness of the Horse—*M*—We do not think it likely that oil of cloves will have the injurious effect on your horse's eyes that you speak of, though the practice of giving these cordials is much to be condemned. The loss of sight in your horses most probably proceeds from specific ophthalmia, which is a constitutional and often hereditary disease. Five and six years are the ages most liable to this disease. High keep, hard work, dark stables, and the ammoniacal fumes from the litter, are the predisposing causes.—*W. C. S.*

Dairy Management—*Recertens*—A cow can be kept on grains and a little hay and carrots in a stable. We know that grains are good food for cows, and we shall obtain for you the experience on this head of some who have used them.

Seed Potatoes—*F E*—The best seed is that which has been harvested when hardly ripe, and afterwards greened in the sun. We should not like tubers from "curled" haulm.

Scotch Cart—*S S S*—We offered the loan of some plans of the kind you describe to one of our correspondents; but since then they have been asked for by so many that it will probably be some time before your turn comes, and therefore you had better apply to Mr. Clyburn, Uley, Gloucestershire.

Warnes's Pamphlet—*B D*—Your booksellers will obtain it for you. We do not know the publisher. Try Rideway, Piccadilly.

Winter Barley—*J H W*—Will any of our readers give us their experience of Barley sown before winter, say by the 1st of October, and whether there is any advantage in putting it in the ground at that season?

Markets.

Smithfield, Monday, Dec. 15.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	4s	4 to 4s 8	Best Downs & Half-breds	4s	4 to 4	6
Best Short Horns		4 2	4 6	Best Long-wools		4 4	4
Second quality Beasts		3 6	4 0	Ewes and second quality		4 0	4
Calves		4 4	5 2	Pigs			

Beasts, 5326; Sheep, 28,240; Calves, 90; Pigs, 310.

To-day being The Great Christmas Market we have a large supply of Beasts, but not quite so many as on this occasion last year, nor do we think anything like the weight of meat. We do not observe so many extraordinary animals, but the supply is of average good quality, which is the most useful to the butcher. There are, however, some of a superior class, which for the sake of Show are readily purchased at rather over our top quotations, but for the common qualities barely supported, and a clearance is not effected. Although the number of Sheep is not very large, in consequence of the mildness of the weather, there is quite enough for the demand. The general quality is very good. The fattest Sheep are a heavy trade, but Downs and half-breds are readily disposed of. Veal and Pork trade remain steady.

Friday, Dec. 19.

We have to-day a full supply of Beasts, and of good quality; the weather still being bad, trade is excessively heavy. The latter description of Beasts is lower by 2*d* per 8 lbs. than on Monday. The more suitable Scots and Herefords are making from 4s 4d to 4s 8d; and best Short Horns at to 4s 6d; but these prices are with difficulty obtained, and several remain unsold; second quality 3s 4d to 3s 10d. Sheep are scarce, and Monday's prices are fully supported, in some instances the best qualities make a trifle over, but nothing quotable. Veal trade is heavy, but late prices are supported. Pork trade is steady.

Beasts, 1461; Sheep, 3090; Calves, 168; Pigs, 208.

Al, West Smithfield.

* Many old cottages in the country were justly deserving of condemnation; but a laudable attention to the subject of late years has had the effect of adding much to the comfort and accommodations of the dwellings of the poor.

* In addition to the above, the steward on the farm receives 6*l.* or 7*l.* extra; and the shepherd has, besides, several sheep kept, of which he sells the produce, thereby possessing a particular interest in the safety and welfare of the flock.

COVENT GARDEN, Dec. 20.—The Market has been well supplied during the week with Vegetables of almost every kind, and the quantity of Fruit has also been sufficient to meet the demand. Among Pine Apples we noticed some handsome specimens, which are offered at nearly the same prices as quoted in our last Report. Grapes are also selling at last week's prices. The supply of Apples continues to be well kept up: good samples meet with a ready sale, but small Apples, which form by far the greater proportion, can scarcely be sold at any price. Pears are good in quality, and command a tolerably brisk trade. Oranges are becoming more abundant, and prices for them are in consequence lower. Lemons are also cheaper. Nuts remain nearly the same as last week. Of Vegetables the supplies of most articles are sufficient for the demand. Cauliflowers are, however, scarcer; but Broccoli is abundant, and Savoys, Brussels Sprouts, and other winter Greens are plentiful. Carrots and Turnips are excellent in quality, and sufficient for the demand. Potatoes have altered very little in price since last week; trade for them is not brisk. Seakale is more plentiful, and the same may be said of French Beans. Asparagus, although rather small, is good in quality. Celery, both red and white, is abundant, and Lettuces, Endive, and other kinds of salading, are sufficient for the demand. Cut Flowers chiefly consist of Euphorbias, Bignonia venusta, Epiphyllums, Acacias, Heaths, Heliotropes, Cinerarias, Pelargoniums, Camellias, Chinese Primroses, Chrysanthemums, Violets, and Roses.

Tarragon, per bunch, 6d
Mint, per bunch, 2d
Marjoram, per bunch, 4d
Chervil, per punnet, 2d to 3d

POTATOES.—SOUTHWARK, WATERSIDE, Dec. 15.

The arrivals to this Market during the past week have been very limited, and in consequence of the prevalence of the W.N.W. wind those cargoes from the Northern districts that had a quick passage arrived in tolerable condition. Some cargoes of York and Scotch Reds, the arrivals of which were announced in our last report, turned out much damaged; York Reds were sold as low as 5s per ton; and Scotch Reds at 20s per ton; but the best samples of York Reds sold as high as 120s: ditto Regent's, from 100s to 110s. The best samples of Perth Reds were sold at 80s per ton, but 90s has been asked for one or two fresh, small cargoes that arrived at the close of the week.

HAY.—Per Load of 36 Trusses.

With a dull trade at the above prices.

MARK-LANE, MONDAY, Dec. 15.

The uncertainty respecting an alteration in the Corn-laws continues to have a very depressing influence on the prices of all descriptions of Corn. This morning, although the supply of English Wheat by land carriage samples was one of the smallest received since harvest, owing to the above cause and its bad condition, sales were difficult to effect, even at a decline of 2s. to 3s. per qr.; holders of free Foreign and Bonded not being disposed to submit to a reduction, their value remains nominally unaltered. Best Malting Barley barely maintains our quotations, inferior qualities are very unsaleable and 2s. per qr. cheaper. Beans and Grey Peas are 1s. per qr. lower, White scarcely saleable unless at a reduction of 3s. to 4s. per qr. The Oat trade is exceedingly heavy, and confined to retail purchasers, at a decline of 1s. to 1s. 6d. per qr.

BRITISH, PER IMPERIAL QUARTER,			s.	s.		s.	s.
Wheat, Essex, Kent, and Suffolk	White	58	66	Red	54	62

Peas, White	44 to 48	Maple	36	37	Grey	33	35

FRIDAY, Dec. 19.

Business in all descriptions of Corn is dull, and confined to the merest retail purchases for immediate consumption; prices may be regarded nominally the same as Monday, but sales of amount could not be effected in any article, free or bonded, without submitting to a decline. New York letters of the 29th ult. inform us, that the price of Flour there, on the arrival of the Britannia, touched 33s. 9d. per barrel f. o. b., but had subsequently receded to 29s. 7d. per barrel f. o. b. The stocks were estimated from 350,000 to 500,000 barrels: the former quantity it was calculated would be required for the consumption of the town and its environs during winter.

KINGSFORD AND LAY.

FOREIGN SHEET GLASS.

C. JARVIS continuing to import large quantities of the above article, and having a considerable stock on hand, in quality and substance hitherto unequalled, can offer it to purchasers at a lower price than any other house in the trade, for ready money only, at his old established WINDOW GLASS WAREHOUSE, 38, Great Castle-street, a few doors from Regent-street, where orders forwarded with reference meet with prompt attention.

Every other description of WINDOW GLASS equally low in price.

FOREIGN SHEET GLASS, of good quality, for Horticultural and general purposes. To be had at F. ELPHICK'S, 28, Castle-street East, Oxford-street. For Ready Money only.

DENTON AND CHARNOCK'S PATENT DRAIN-TILE AND PIPE MACHINE.

A PREMIUM OF £10 was awarded to this Machine at the recent Meeting of the Yorkshire Agricultural Society, at Beverley, as the Best Machine of the day. Price £20.

Particulars may be obtained, and a Machine seen, on application to Mr. BAILEY DENTON, 9, Gray's-Inn Square, London; or Graveley, near Stevenage, Herts; to Mr. T. H. Charnock, Wakefield; or to the Makers, Messrs. Bradley and Co., Engineers, Wakefield.

DENTON'S "A" LEVEL for workmen in cutting drains may also be had. Price 30s.

NUNN'S VEGETABLE OIL, 4s. 6d. per imperial gallon, gives a clear and brilliant light in every description of lamp, without smell or smoke, does not corrode the lamps, and they confidently recommend it to the public as being the most cleanly as well as the most economical oil now in use. Finest sperm oil 7s. 6d., and solar oil 3s. 3d. per imperial gallon; best yellow soap 54s., best mottled do. 60s., per 112 lb.

NUNN'S VICTORIA COMPOSITE CANDLES, 10s.; NUNN'S Victoria Wax Candles, 11s. 6d.: also their genuine Margarine Wax Lights, 16s.; also their patent plaited wick Sperm Candles, 20s. per dozen lb. THOMAS NUNN and SONS (34 years purveyors to the Hon. Society of Lincoln's-inn), 19, Great James-street, Bedford-row.

RINGWORM, AND OTHER SKIN DISEASES, EFFECTUALLY CURED BY HOLLOWAY'S PILLS AND OINTMENT.—Mrs. Grace Moro, No. 6, Hemlock-court, Carey-street, London, has a little Girl who, for Four Years, was dreadfully disfigured with Ringworm; almost every Surgeon of celebrity had been consulted, as well as every remedy for such cases tried, in vain, when the Father of the Child (who is a law-writer) was recommended to try HOLLOWAY'S celebrated Medicines, which effectually cured the Child in three weeks. No Scrofulous Sores, Blotches, Pimples, or Scorbutic Humours, can resist the power of these far-famed remedies.—Sold by all Medicine Vendors; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

CHRISTMAS AND NEW YEAR'S GIFTS.—The present season is hallowed by one of the most delightful offices of Friendship and Affection; the interchange of Gifts as remembrances of the donors, and tokens of their esteem for the receivers. The most appropriate present becomes the first subject of consideration; a merely useful one can afford no evidence of taste, while a present possessing no claims to utility, shows a want of judgment. To combine these requisites, a more fitting souvenir cannot be suggested than

ROWLAND'S TOILET ARTICLES,

THE

"MACASSAR OIL," "KALYDOR," AND "ODONTO,"

each of infallible attributes. In creating and sustaining *luxuriant silken tresses*, ROWLAND'S MACASSAR OIL is highly and universally appreciated; ROWLAND'S KALYDOR is a preparation of unparalleled efficacy in improving and beautifying the Skin and Complexion; and ROWLAND'S ODONTO, or PEARL DENTIFRICE, is invaluable for its beautifying and preservative effects on the Teeth and Gums.

The August Patronage conceded by our Gracious Queen, and the Several Sovereigns of Europe, and the confirmation by experience of the infallible efficacy of these *creative renovating specifics*, have characterised them with perfection, and given them a celebrity unparalleled.

BEWARE OF SPURIOUS IMITATIONS!!!

☞ See that the word "ROWLAND'S" is on the Wrapper of each Article.

Sold by them at 20, Hatton-garden, London, and by Chemists and Perfumers.

Dedicated by Permission to the Right Hon. THE EARL OF AUCKLAND, K.C.B., Vice President of the HORTICULTURAL SOCIETY,

THE ANNALS OF HORTICULTURE & YEAR-BOOK OF INFORMATION ON PRACTICAL GARDENING, containing 580 pages of Letter-press, 138 Illustrations, and a beautifully-coloured Frontispiece. Price 16s.

HOULSTON and STONEMAN, 165, Paternoster-row, and all Booksellers.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics.—It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible: the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science and the leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4s. 6d. cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated and rendered practically useful to the various purposes of Life, with numerous Cuts. Second Edition. 4s. 6d. cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4s. 6d. cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 4s. 6d. cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."
—*Library of Useful Knowledge, Article "Mechanics."*

TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

Just Published, price 6s. cloth,

THE HAND-BOOK OF CHEMISTRY; with a complete Index of Reference. By G. H. CAUNTER, Esq.
London: W. S. ORR & Co.; and W. & R. CHAMBERS, Edinburgh

TO NOBLEMEN, GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to Public Competition at the Auction Mart, Bartholomew Lane, on Tuesday, December 23rd, 1845, at twelve o'clock, about 200 CAMELLIAS, comprising all the approved varieties, the whole beautifully furnished with bloom buds (consigned from Mons. Louis Van Houtte, Nurseryman and Florist to the King of the Belgians), also a splendid assortment of Standard and Dwarf Roses, Dutch Bulbs, &c. May be viewed the morning of Sale, and Catalogues had at the Mart and of the Auctioneers, American Nursery, Leytonstone.

DORKING, SURREY.—TO NURSERYMEN.

TO BE DISPOSED OF immediately, the old-established NURSERY BUSINESS OF MR. ROBERT WESTLAND, in an eligible situation at Dorking, fronting the Turnpike-road. The whole of the Stock to be taken at a valuation. The commodious House, with the Seedshop, useful Out-buildings, and Nursery Garden, is let at a moderate Rent, and may be entered upon immediately.

For particulars, apply to Messrs. HART & HART, Solicitors, Dorking, Surrey.

MR. GOADBY having discovered a mode of preserving objects of NATURAL HISTORY, and especially the soft Invertebrata, with a success not before obtained, and, having spent the greater part of his life in perfecting the display of the structure of Insects, Mollusca, and other Invertebrata, has formed a collection of such preparations, which he is now, in consequence of the state of his health and other reasons, desirous to dispose of for 500*l*. This sum, which is much below its actual value, it is proposed to raise by subscription, in order that the Collection may be presented to some Public Museum. Mr. GOADBY has made known his processes and preserving fluids through the medium of the British Association, at the meetings of which body, as well as at other public assemblies, the specimens have been exhibited; and the value of both the processes and results has been fully recognised by Naturalists and Comparative Anatomists.

Several specimens in Mr. GOADBY'S Collection are the result of many months' assiduous labour, and are unique. The number of the specimens is upwards of 150.

THE CORN AND PROVISION TRADES.—The deficiency of the Harvest, the failure of the Potato Crop, and the consequent serious effects upon commercial and monetary affairs, excite great apprehension. Under such circumstances, correct information as to the produce of the harvest, the extent of the failure of the Potato Crop, the state of the markets, the stock of grain on hand, on the continent of Europe, and in the United States, is of the highest importance. No trouble or expense is spared to furnish such information, which is brought down to the latest moment of going to press, in the MARK-LANE EXPRESS, which has been for many years the authority in the Corn and Provision Trades in England and in foreign countries. Published every Monday in time for post, and may be had by order of all Booksellers, Newsmen, &c. Office, No. 24, Norfolk-street, Strand. Price 1*l*. 10*s*. 4*d*. per annum.

THE TENANT FARMERS' ADVOCATE.—It is abundantly manifest that the position of the Agricultural Interest as a class is undergoing and must undergo a great change. In such change the relative position of "LANDLORD AND TENANT" will form the most important feature, and the establishment of a sound system of "Tenants' Rights" will be a cardinal point for "Tenant Farmers." For 14 years THE MARK-LANE EXPRESS AND AGRICULTURAL JOURNAL has been the zealous and uncompromising advocate of the TENANTS' RIGHTS, and with the conviction that the interests of the Tenantry are vitally involved in the question, the columns of this Journal will be continuously devoted to its discussion and elucidation. Published every Monday in time for Post. May be had by order of all Booksellers and Newsmen.—Office, 24, Norfolk-street, Strand, London. Price 1*l*. 10*s*. 4*d*. per annum.

NEW AGRICULTURAL MAGAZINE.

THE SENTIMENT OF FLOWERS; with Twelve Groups of Flowers, tastefully designed and coloured

"In Eastern lands they talk in flowers,
And they tell in a garland their loves and cares
Each blossom that blooms in their garden bowers
On its leaves a mystic language bears."

This work teaches the eloquent language referred to in the above beautiful lines. As in the East, so in the fair island of Britain, "flowers are here made to speak the language of sentiment."

"A charming little book. With a dozen of sweet floral coloured plates, it is precisely the thing for a fair lady's boudoir."—*Literary Gazette.*

HOULSTON & STONEMAN, 65, Paternoster-row.

Price Fourpence, of any Bookseller.

TO BE PERMANENTLY ENLARGED, AT THE COMMENCEMENT OF THE NEW YEAR, TO TWENTY-FOUR LARGE QUARTO PAGES.

SUPERIOR NEW EARLY PEA.—WARNER'S "EARLY EMPEROR" Pea, the earliest in cultivation, quite hardy, a good Cropper, with fine Pods, and most delicious flavour. Height about 2 ft.—5*s*. per quart.—To be had of Warner and Warner, Seedsmen, 28, Cornhill, London.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s*. per dozen.—The importation of the above-named Bulb has just been received at A. Corbett's Italian and Foreign Warehouse, 18, Pall Mall. The Orange, Lemon, Citron, Lime, and Shaddock Trees, Catalonia, Agorian, and Arabian Jessamine Plants expected early in January.

MARNOCK AND MANLEY beg to inform their friends that they have selected with great care their Stock of VEGETABLE and FLOWER SEEDS for the present season, including every variety worthy of cultivation.—Catalogues will shortly appear, and may be had on application at their Nursery, Hackney, London.

VERY SPLENDID NEW WHITE FUCHSIA.—The Subscribers beg to intimate to the Floricultural Public, that they have raised a WHITE FUCHSIA of great beauty, which they purpose naming "ACANTHA." The flower is between 3 and 4 inches in length, tube and sepals waxy white, with bright scarlet corolla, which opens well. It is of a compact upright growth, and a most abundant bloomer; plants about 6 inches high being now in full flower. The original plant is still in flower, and has been since the month of June. See Dr. Lindley's remarks in the *Chronicle*, Nov. 29, page 804 ("Seedling Flowers"); also Mr. Marnock's, *United Gardeners' Journal*, Nov. 22, page 744.
Good plants will be ready to send out in Spring.
F. & J. DICKSON, Upton and Newton Nurseries.
Chester, Dec. 27, 1845.

TRUE FASTOLFF RASPBERRY.
JOHN BELL begs to inform his Friends and the Public, he has still a large Stock of the above RASPBERRY, which he offers at the following prices:—
Fine strong Canes, at per 100, package included .. 1*l*. 0*s*.
Smaller ditto, per 100, package included 0 15
The Trade supplied on liberal terms.
For list of ROSES J. B. begs to refer the readers of this Paper to his Advertisement of the 6th and 13th.
Orders addressed, "Seed Warehouse, 3, Exchange-street, Norwich, will meet immediate attention.
Horticultural Establishment, Bracondale, Norwich.

COOPER'S PATENT PRESERVED FRUITS have been proved to keep in a sound and perfect state for family use for five years; they are put up in stone ware bottles, of different sizes, lined with glass. An assortment of Fruits that are usually preserved, and with a machine cork-screw to draw the corks, are packed in a hamper, and will be delivered to any part of London for 10*s*., by an order sent to the Patentee at the manufactory, No. 7, the upper end of St. John-street, Clerkenwell, London. Particulars and Testimonials may be had, as above, or they will be forwarded by Post if requested. One trial will prove their excellence.

TRANSPARENT FRAME AND GREENHOUSE COVERS, made from strong sheeting calico dressed by machinery, with a transparent waterproof preparation, only 6*d*. per square yard; quite as cheap and twice as durable as the garden mats, and more adapted for horticultural purposes, in consequence of admitting light. It will give protection to plants equal to two mats.—Robert Richardson, Maker of Garden Nets, Fishing Nets, Sheep Nets, Rabbit Nets, &c., 21, Tonbridge-place, New-road, London.
N.B.—Capes for Gamekeepers and Watchers: also 2000 second-hand Policemen's Capes on Sale, at 2*s*. and 2*s*. 6*d*. each, redressed.

E. BECK informs the Public that the various Articles manufactured by him in Slate for Horticultural purposes, may be seen in use at Worton Cottage, Isleworth, upon application to the gardener (*Sundays excepted*).

NEW KITCHEN GARDEN SEEDS.
CHARLES FARNES, Nurseryman and Seedsman, 128, St. John's-street, London, begs to inform his Friends and the Public generally, that he is now sending out the following articles, which are warranted to grow well, and give satisfaction to all purchasers. Early orders are requisite, as some sorts are only to be had in limited quantities.

Peas. Per quart—*s*. *d*.		Per packet—*s*. *d*.	
Earliest May	1 0	Davis's Free-Bearing do.	2 6
Royal Green Marrow ..	2 6	French Beans, new Royal Dwarf .. Per quart	4 0
Shilling's Grotto do. ..	1 6	Do., do. Long Negro ..	4 0

Queen of Dwarfs (Waite's)	5 0	Per packet.	
Dancer's Monastery ..	2 6	Lettuce, Ady's Large Cos, true	0 6
Fraser's Shanley Marrow	3 0	Do., Paris Summer do. White	0 6
British Queen do. ..	2 0	Do. do. Large, do. Green	0 6
Prince of Wales do. ..	5 0	— London Market, do. White	0 6
Large New Mummy do ..	5 0	Do., Large Malta Cabbage	0 6
Large Milford do. ..	1 0	Melon, Seymour's new Persian, great bearer, of rich flavour, and very handsome, weight 2 to 3 lb	2 6
Large Mammoth do. ..	2 6	Onion, all sorts for spring and winter use, per oz.	0 6
Dwarf Skinless	1 0	Per packet.	
Broccoli. Per Pkt.		Parsley, Enfield Matchless, curled	0 6
True Early Walcheren White	1 0	Do., Deptford fine do. ..	0 6
Do. do. Grange's do. ..	0 6	Per oz.	
Do. do. Chappell's do. ..	0 6	Parsnip, Impvd. Guernsey	0 6
Legg's New Hardy Late do.	1 0	Per bushel.	
Chappell's Large Cream	0 6	Potatoes, early Ash-leaved	10 0
Imperial Winter ..	0 6	Prices of other varieties free from disease, will be sent on application.	
Beet, Splendid Black ..	0 6	Radish, the finest early Scarlet, transplanted stock, for frames or open ground, per quart ..	4 0
,, Dark Crimson ..	0 6		
Carrot, Earliest Horn ..	0 6		
,, Scarlet Surrey ..	0 6		
,, Large Altrincham	0 6		
,, ,, White Cattle	0 6		
Cauliflower, earliest var.	1 0		
Celery, Lancashire Hero, fine red solid	1 0		
Walnut-flavoured pink do.	1 0		
Cucumber, splendid Hybrid Frame	2 6		

With many other Articles too numerous for insertion.
Collections of KITCHEN GARDEN SEEDS (being the most economical way of procuring a supply for the whole year) at reduced prices as below:—

		£	*s*.	*d*.
No. 1.—A complete collection, sufficient for the largest establishment		12	12	0
No. 2.—Do. in smaller quantities		5	5	0
No. 3.—Do. sufficient for a large garden		3	0	0
No. 4.—Do. in smaller quantities		1	10	0
No. 5.—Do. sufficient for a small garden		0	15	0

A General Catalogue of GARDEN, GRASS, and AGRICULTURAL SEEDS will be forwarded on application.

FIRST PRIZE CUCUMBER, "VICTORY OF BATH."
E. TILEY begs most respectfully to inform the Nobility, Gentry, and the Trade generally, that he will commence sending out the seed of the above superb CUCUMBER the first week in January. It is a superior Black Spine, smooth on the rind, and free from ribs or shrivels; scarcely any or no handle; carries its bloom perfect to the last. It is worthy of remark that the advantages of this over other Cucumbers is that it is a very handsome fruit, the earliest and most productive bearer, and the quickest grower known. It has been grown by the side of the best yet out, and has proved itself more forward than any other by eight or ten days. The average length of this Cucumber is from 18 to 24 inches long. As a further proof of the above it obtained the First Prize in March, 1844, at the Bath Cucumber Show, and First at the Bath Horticultural Show in April, 1844, and Chippenham Horticultural Show, 1844. First, Second, and Third Prizes in March, 1845, at the Bath Cucumber Show; also the Bath Horticultural Show in April, 1845. It will be sent out in packets (postage free). Three seeds, 2*s*. 6*d*.; Seven seeds, 5*s*.
Sold at E. Tiley's General Seed Shop, 16, Pulteney Bridge, Bath, or Mr. Gregory, Nurseryman, Cirencester.
A remittance expected from unknown correspondents.

MR. GEORGE CORNWALL, Market Gardener, Barnet, begs to recommend his New VICTORIA RASPBERRY to the notice of Gentlemen, and likewise Gardeners, as being the finest fruit and best flavoured Raspberry of any grown—it was sold in Covent-garden last season higher than any other; it is likewise a most abundant bearer, and grows 10 feet high. To be had at E. Charlwood's, Covent-garden; Messrs. W. and J. Noble, Fleet-street; of Mr. George Cornwall, opposite the Red Lion, Barnet; and all the principal Seedsmen in London, at 3*l*. per 100, or 9*s*. per dozen.

TO CUCUMBER AND MELON GROWERS.—The Advertiser begs to offer with confidence a few Seeds of a very fine hybrid BLACK SPINE CUCUMBER, which obtained prizes at Shows near London in 1844. It is a distinct sort. Growth from 15 to 20 inches, a good bearer and fine bloom. Packets of 4 Seeds for 1*s*., or 3 packets for 2*s*. 6*d*.; also 4 Seeds of the true WINDSOR PRIZE MELON for 1*s*., on application to Mr. Shilling (late of North Warnborough Nursery), Kingston-on-Rail, Surrey.

SEEDS.—CORNER OF HALF-MOON-STREET,
THOMAS GIBBS and CO.
(by Official Appointment) the SEEDSMEN to the "ROYAL AGRICULTURAL SOCIETY OF ENGLAND."
Beg to remind the Members of the Society, and Agriculturists in general, that their only Counting House and Seed Warehouse is at the Corner of HALF-MOON-STREET, PICCADILLY, LONDON, as for the last Fifty Years.
Priced Lists of Agricultural Seeds are always ready, and may be had on application.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & OTHERS.
BRITISH AND FOREIGN SHEET GLASS for Horticultural purposes, Sky-lights, &c., may be had at JAMES BROMLEY'S, 315, Oxford-street, London, at the Reduced Prices; also Microscopical Glass, French Shades, Plate and Crown Window-glass.
J. B. will be happy to furnish Lists of Prices, or any other particulars that may be required.

FOREIGN SHEET GLASS, of good quality, for Horticultural and general purposes. To be had at F. Elphick's, 28, Castle-street East, Oxford-street. For Ready Money only.

FOREIGN SHEET GLASS.
C. JARVIS continuing to import large quantities of the above article, and having a considerable stock on hand, in quality and substance hitherto unequalled, can offer it to purchasers at a lower price than any other house in the trade, for ready money only, at his old established WINDOW GLASS WAREHOUSE, 38, Great Castle-street, a few doors from Regent-street, where orders forwarded with reference meet with prompt attention.
Every other description of WINDOW GLASS equally low in price.

SMALL GLASS for HOTHOUSES and GARDEN LIGHTS.

ROBERT DALL & CO., Glass Merchants, Hull, beg to call the attention of Noblemen and Gentlemen to the above prices for Glass suitable for Horticultural purposes; and as they are advantageously situated for importing, there being a daily steam communication between the port of Hull and the Continental Markets, and, in addition to this, having made arrangements with eminent English Manufacturers for a regular supply, they are enabled to offer every advantage to the purchaser, and also to insure the prompt execution of all orders with which they may be favoured.
N.B. Cucumber and Striking Glasses supplied.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea. By special appointment to the Queen and H.R.H. Prince Albert.
PHEASANT POULTS.—Gentlemen stocking their preserves are respectfully informed they can be supplied with any quantity of TAME BRED AND WILD PHEASANTS, as above, also a great variety of useful and ornamental Water Fowl. Domestic Poultry, including Malay, Cochin China, Dorking, Spanish, &c., Fancy Bantams, &c., &c., 3, Half-moon-passage, Gracechurch-street.

SMITH AND CO.

ESTABLISHED NINE YEARS.
HORTICULTURAL BUILDERS, HOT-WATER APPARATUS, AND GENERAL GARDEN FURNITURE MANUFACTURERS;
GLEBE PLACE, FACING KING'S PARADE, KING'S ROAD, CHELSEA, LONDON.
Fountains, Vases, Figures, &c. &c., in great variety.

CONICAL BOILERS.—These excellent Boilers, invented by John Rogers, Esq., are made of various sizes by John Shewen, Ironmonger, Sevenoaks. They are applicable to all kinds of apparatus, and are in use at Messrs. Loddiges', Hackney; Messrs. Chandler's, Vauxhall; Messrs. Rollisson's, Tooting; Mr. Pontey's, Plymouth; Mr. Henderson's Pine-apple-place; and in the Horticultural Society's Gardens.

HOT WATER APPARATUS.—The attention of Architects, Builders, and others, is respectfully requested to Benjamin Fowler's superior method of Heating Churches and Chapels, Halls, Stair-cases, Conservatories, Forcing and Greenhouses, Manufactories and Warehouses, Kilns, Rooms for Drying Timber, &c., and every variety of purpose for which artificial heat is required. Within the last 20 years some hundreds of buildings have been heated upon this plan, and the parties for whom they were executed are constantly expressing their satisfaction, also their willingness to vouch for their efficiency. An improved wrought-iron boiler, which requires no brickwork, may be seen in action upon the premises.
Benjamin Fowler, 63, Dorset-street, Fleet-street.

THE TANK SYSTEM.

BURBIDGE and HEALY having heated a considerable number of Pits and other Horticultural Structures, for the cultivation of Pines, Melons, Cucumbers, and other tropical plants, particularly upon the plan recommended in Mr. Mills's recent work on the Culture of Pines and Cucumbers, many of which are working at the present time, prove beyond a doubt that every kind of structure may be heated by Burbidge and Healy's peculiar Tank Apparatus, with the absolute certainty of producing the desired result. Their Apparatus may be seen at work at the following places:—Horticultural Gardens, Chiswick; Royal Botanic Gardens, Kew; Baroness Rothschild's Gardens, Gunnersbury; Mr. Glendinning, Chiswick Nursery; Messrs. Henderson, Pine-apple-place; and in more than one hundred other places.—155, Fleet-street, London.

HEATING BY WARM WATER.—An improved method of HEATING, by the CIRCULATION OF HOT WATER, may be seen in operation daily, at J. L. Benham & Son's Stove Grate Manufactory, 19, Wigmore-street, Cavendish-square. Estimates given for warming Churches, and other Public or Private Buildings, in town or country. A great variety of Warm Air Stoves of every description, from 15s. to 20l.—19, Wigmore-street, Cavendish-square.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to the inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their Manufactory.

STEPHENSON and CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire Work, &c. &c.

EXHIBITIONS AT THE GARDEN OF THE HORTICULTURAL SOCIETY OF LONDON, FOR THE YEAR 1846.

THE EXHIBITIONS will take place on the Second Saturdays in the months of May, June, and July.

MEDALS AND REWARDS.—The Society distributes the following Medals and Rewards; namely—

C. The Certificate	value—£0 10 0	SG. Large Silver Gilt Medal	value—£4 0 0
SB. Silver Banksian Medal	1 0 0	GB. Gold Banksian Medal	7 0 0
SK. Silver Knightian Do.	1 5 0	GK. Gold Knightian Medal	10 0 0
LS. Large Silver Medal	1 15 0	LG. Large Gold Ditto	20 0 0

Class I.—FLOWERS; for which Nurserymen and Private growers exhibit independently of each other.

A Pelargoniums; in collections of 12 new and first rate varieties, cultivated with superior skill, in 8-inch pots. GB—SG—LS

B Pelargoniums; in collections of 12 varieties, in 8-inch pots. GB—SG—LS

C Pelargoniums; in collections of six varieties, in 11-inch pots. LS—SK—SB

D Roses, in pots; Amateurs to show in collections of 12, Nurserymen in collections of 18, distinct varieties. GB—SG—LS

NB. The Judges are required to disqualify any collection which shall be found to contain a plant which has been recently placed in the pot from the open ground.

E Roses, in pots; single specimens displaying superior cultivation. SK—SB—C

F Moss Roses in loose bunches, each consisting of three trusses as they are gathered, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties. SK—SB—C

G Other Roses, exhibited as in the last letter, and in 50 varieties. LS—SK—SB

NB. No one who exhibits in this letter can also compete in the following.

H Other Roses, exhibited as in the letter F, and in 25 varieties. SK—SB—C

NB. Higher Medals than those here offered for Roses cannot be given by the Judges; and if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to compete.

I Cape Heaths; in collections of 20 entirely distinct varieties. GK—GB—SG

NB. It is expected that the same plant shall not be exhibited on more than one occasion.

K Cape Heaths; in collections of 12 entirely distinct varieties GB—SG—LS

L Cape Heaths; in collections of six entirely distinct varieties. SG—LS—SK

NB. No person will be allowed to show in more than one of the classes *I*, *K*, and *L*.

M Cape Heaths; single specimens displaying very superior cultivation. LS—SK—SB

N Calceolarias, in sixes; in 8-inch pots. LS—SK—SB

O Carnations, in pans of 24 distinct varieties. LS—SK—SB

P Picotees, in pans of 24 distinct varieties. LS—SK—SB

Q Pinks; in pans of 24 distinct varieties. SK—SB

R Ranunculuses, excluding Turbans; in stands of 12 distinct varieties for private growers, and 24 for Nurserymen. LS—SK—SB

Class II.—FLOWERS; for which all persons are admitted to equal competition.

S Stove or Greenhouse plants; in collections of 40 plants. LG—GK—GB

NB. Calceolarias, Fuchsias, Orchidaceæ, and Pelargoniums to be excluded from *S*, *T*, *V*, and *W*.

T Stove or Greenhouse plants; in collections of 20 plants. GK—GB—SG

NB. Exhibitors cannot show in more than one of the classes *S*, *T*, *V*, and *W*.

V Stove or Greenhouse plants; in collections of 12 plants. GB—SG—LS

W Stove or Greenhouse plants; in collections of six distinct species. SG—LS—SK

X Greenhouse Azaleas; in 12 distinct varieties. GB—SG—LS

Y Greenhouse Azaleas; in six distinct varieties. SG—LS—SK

NB. No one can show in both classes of Azaleas.

Z Collections of New Hardy Evergreens in pots; LS—SK—SB

AA Exotic Orchids; in collections of not fewer than 20 species. LG—GK—GB

NB. Exhibitors cannot show in more than one of the classes *AA*, *BB*, *CC*.

BB Exotic Orchids; in collections of 12 species. GK—GB—SG

CC Exotic Orchids; in collections of six species. GB—SG—LS

DD Scarlet Pelargoniums; in six distinct varieties, in pots not less than 11 inches in diameter. LS—SK—SB

EE Pelargoniums: in six DISTINCT SPECIES. SG—LS—SK

NB. By the word species is meant the wild kinds imported from the Cape of Good Hope, or New Holland, tuberous species inclusive, and not garden cross-breds.

FF Achimenes; in collections of six species, grown in pans not less than a foot in diameter. LS—SK—SB

GG Distinct varieties of Tall Cacti in flower. GB—SG—LS

NB. The GB and SG Medals are not to be given if fewer than six varieties are exhibited.

HH Fuchsias; single specimens. SK—SB—C

NB. No person can receive more than one prize under this head.

II Hardy Orchids in pots, in collections; exclusive of Cypripediums. SK—SB—C

KK Hardy Cypripediums. SK—SB—C

LL Hybrid Alströmerias; cut specimens. LS—SK—SB

MM Statices; in collections of six species. SG—LS—K

NN New or extremely rare ornamental plants. SG—LS—SK

NB. These Medals will be awarded by the Society's Officers and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. *Nothing will be regarded as new which has been exhibited in the Garden in a previous season.*

OO Single specimens of very superior cultivation. SG—LS—SK

PP Miscellaneous subjects. SK—SB—C

NB. Exhibitors under *PP*, will not be thereby *entitled* to a pass ticket. Cockscombs, Heartsease, Hydrangeas, and bouquets, are altogether excluded from exhibition.

RR Seedling Florists' flowers. SK—SB—C.

NB. Every seedling must be shown singly, and marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than 6 seedlings at each meeting. Exhibitors under this head will not be thereby *entitled* to a pass ticket. For seedling Pelargoniums exhibited the first year no higher prize shall be given than a certificate and this is to be awarded to flowers of decided merit. Seedling Pelargoniums of the second year must be shown in pots not smaller than 32s, and each exhibitor may produce 6 of them, but not a larger number.

IN ADDITION to any Medals assigned to the classes, *I*, *S*, *T*, and *AA*, the SK, SB and C are offered for the collections in these classes which shall be best named by the Exhibitor.

N.B. The Society's Officers, who will make this award, will be guided in their judgment by a consideration not only of the correctness of the names, but of the accuracy of the spelling, and the neatness of the writing.

Class III.—FRUIT; for which Market Gardeners, Fruiterers, or Persons in the habit of regularly supplying the Market, and Private Growers, exhibit independently of each other.

N.B. All Fruit must be FULLY ripe and WELL COLOURED, and PROPERLY NAMED by the Exhibitor as far as practicable, if the contrary, it will be disqualified.

SS Miscellaneous collections of fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind. GK—GB—LS

NB. Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter. Exhibitors of collections of Fruit should bear in mind that however fine one or two of the kinds in this collection may be, they cannot gain a prize unless they furnish at *least* three different kinds of fruit of *first rate quality*.

TT Grapes. SG—LS—SK—SB

VV Pine Apples. SG—LS—SK—SB

WW Peaches or Nectarines, in dishes of six specimens. SK—SB

XX Other kinds of fruit. SK—SB—C

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also those for Distillers, Brewers, Soap Boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by Benjamin Fowler, Engineer, &c., 63, Dorset-street, Fleet-street, London.

THE URATE OF THE LONDON MANURE COMPANY, FOR TARES, TURNIPS, WHEAT, &c., at Four Guineas per Ton.—The above Manure having stood the test of many years' experience, is recommended with the greatest confidence; being uniform in its manufacture, it may be relied upon at all times, thereby preventing those great disappointments which frequently occur from the difficulty of obtaining Guano and other Manures in a pure state. It will be found most useful for Wheat on all soils, where it is requisite to procure a full plant early in the autumn. Full particulars and testimonials forwarded on application. The Company also supply genuine Peruvian and African Guano, Sulphuric Acid, Gypsum, and every artificial Manure, at the lowest market price, and warranted of the best quality.

40, New Bridge-st., Blackfriars. E. Pursen, Secretary.

LIEBIG'S WHEAT MANURE now ready for delivery.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTHONY GIBBS and SONS, LONDON; WM. J. MYERS and CO., LIVERPOOL;

And by their Agents,
COTSWORTH, POWELL, and PETER, LONDON;
GIBBS, BRIGHT, and CO., LIVERPOOL and BRISTOL.
47, Lime-street, Dec. 27.

GYPSUM.—PURE GYPSUM (in fine powder), in 5-ton lots at 25s. per ton in the stream, or 27s. 6d. per ton landed. Also Guano (Peruvian and African), Superphosphate of Lime, Bones, Sulphuric Acid, and all other manures of known value, on Sale. By Mark Fothergill, 40, Upper Thames-street, London.

IMPROVED DIBBLING MACHINE.

JOHN WEATHERSTONE begs to inform the Agricultural Public that his PATENT HORSE-DIBBLING MACHINE is now ready, whereby the greatest regularity may be insured in the deposition of all Seeds. A team of four horses will be found sufficient power to draw one of the largest size.

Price of Machine, with six rows..... £36
" eight rows..... 40
" ten rows..... 45

Applications for further particulars may be made to Mr. Joseph Weatherstone, Cassington, near Oxford; or to Messrs. Gunn and Ward, High-street, Oxford.—Agents wanted in all parts of the country.

ROYAL BOTANIC SOCIETY OF LONDON, REGENT'S PARK.—The days fixed for the Exhibition of Plants, Flowers, and Fruit, in the Gardens of this Society next year, are Wednesdays, May 20, June 3, and July 1. Schedules of Prizes will shortly be ready.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 27, 1845.

MEETINGS FOR THE TWO FOLLOWING WEEKS

FRIDAY,	Jan. 2—Botanical	. . . . .	8 P.M.
MONDAY,	— 5—Entomological	. . . . .	8 P.M.
SATURDAY	— 10—Royal Botanic	. . . . .	4 P.M.

WHEN in the year 1844 (p. 500), we gave some account of a very simple method of HEATING VINERIES, practised at Polmaise, near Stirling, some of our correspondents disapproved of the plan, and depreciated its effects; others, without discussing the principle, contented themselves with inquiring wherein the advantage consisted, and whether as good Grapes had not been grown without any such contrivance? At that time we contented ourselves with expressing our opinion that it was a good working plan, worthy of imitation; but we refrained from making it a prominent subject of discussion until more experience should have been had as to its permanent working.

That experience has been had. We know, upon indisputable testimony, that the Grapes this last year at Polmaise were of the finest quality, as had been anticipated by all who saw them in leaf. "More vigorous and healthy Vines and foliage I never saw," says a friend who visited Polmaise; and an interesting communication from a correspondent who was lately gardener there, which we publish to-day, sets the matter so fully at rest, that we shall next week call especial attention to the nature of the plan pursued by Mr. MURRAY, and perhaps also to the cause of its failure in one place where it has been tried without success.

WE are perfectly aware that the observations made lately on the subject of PINE-GROWING have proved unpalatable to a certain class of people. We intended that they should be. Physic is rarely pleasant, even though honey be rubbed on the edge of the cup that holds it. It is, however, sometimes necessary; and never more so than at the present moment, when the zeal and intelligence of a large number of admirable gardeners, and the aid freely given by the true friends of horticulture, have excited the jealousy and evil-mindedness of a crowd of blockheads, who either cannot, or will not, imitate the examples so worthily placed before them.

A gardener, properly so called, is a man of industry well directed, of knowledge wisely gathered, and of science practically applied. He thus becomes a perfect master of routine, and when routine fails him, he possesses the resources calculated to extend or replace it. And he must necessarily be so; for of all the arts of peace gardening is precisely that which is most varied and least stationary. The ceaseless discoveries of travellers, the quick advance of science, the instability of fashion, the daily invention of new wants by the wealthy, and of new means of supplying them, all involve incessant changes of routine, and render it impossible for an intelligent gardener to stand still. In these respects he is very differently circumstanced from a farmer, whose grain and root-crops are not likely to be changed, who has the season and the season only to contend with, and who runs no risk of the taste of his corn or cattle market changing from Wheat and beef to Durroo and bear's-flesh.

In further illustration of this, let us only see what is now happening all around us. Everywhere hot-water is taking the place of smoke-heat; tanks and aqueous vapour are driving away tan and heating dung; the necessities of the farm are robbing the garden of its stable-manure; iron is replacing wood; little panes of glass are exchanging for large squares: light in excess is thus to be dealt with instead of dimness; and nobody now rests satisfied with the scrubby bushes which are everywhere ousted by "specimen" plants. These things have happened, and are happening every day. In the prospect, but close upon us, are further changes. Winter gardens, covered with glass but unheated, will infallibly make their appearance; healthy plants will be as universal an appendage of a drawing-room as the chairs and tables; squares in great towns must not only be planted, but kept in health and beauty; coloured glass will be used for roofs instead of white glass; foreign fruits till now unheard of will be as common as Pines and Grapes: and even the kitchen-garden may expect the advent of vegetables hitherto unknown. Hoo-sungs, Han-tsis, and Arracachas, are but the heralds of a host of novelties which universal commerce, rapid voyages, wealth and luxury, will require of the gardener.

And how are gardeners to meet these demands? In what way are they to give the world an assurance that as the nature of the objects and means of gardening change, they will be found capable of dealing with them? Not by shutting their eyes to the advantage of learning; not by sneering at that which they cannot equal; not by fancying that the whole aim of life is to make shift to keep a place when one is found; but by a diligent striving after excellence; by a firm resolution to regard nothing as well done which others can do better, and by an eager desire to imitate the great masters of their art, not to disparage them.

Some persons fancy that because they can hoe, dig, rake, and sow Radish-seed, they therefore are gardeners. They quite mistake the matter: they are only garden-labourers. Others are of opinion that industry of body is equivalent to activity of mind; forgetting that the first is also the virtue of a ploughman. A gardener must have both qualities; he must be industrious in order to get his work done, and he must be active-minded in order to get it well done. Some, again, we hear of, who flatter themselves that the whole duty of a gardener consists in the art of cultivation: that if he can but grow a plant he is under no obligation to know its name. This is mistake the third. Such men as these gather Lovage for Fennel, buy Alaternuses for Phillyreas, and plant Mountain Ash for Alders. They are no better than the London servant, who being sent into a garden to fetch some Strawberries, complained that she could not find a single tree that bore any. Yet we see such persons expecting the wages, and claiming the respect due only to those who have really qualified themselves as gardeners. They also mistake their position; they are but one step above the garden-labourer.

We quite believe that the great class of intelligent men, who do honour to their profession, will doubt whether the preceding remarks can have any real application at the present day. Alas! for the cause of education. We have too much reason to know that prejudice and ignorance are rife enough among gardeners to deserve much more than we are inclined to say of them. A remarkable illustration of this has so forced itself upon our attention as to compel from us these remarks. A few weeks since we printed a series of questions (p. 545), which Messrs. KNIGHT and PERRY, the Nurserymen, require all gardeners applying to them for places to answer before they can be recommended. In our opinion nothing could be more judicious than their plan, and we said so. Its object was to ascertain what a man really does or does *not* know. Nothing more was proposed or required. Nevertheless it has produced the most absurd abuse; as a specimen of which we select the following scrawl, which the writer has particularly requested us to insert. We print it literally, merely omitting the name and residence of the man, who would probably be ruined if he were known:—

"A NEW PHENONIMEN.

"Wonders sure will never ceace
While wit and wisdom so increace.

"Acording to the suggestion of those wise and all-knowing men, Messrs. Knight and Perry, the unfortunate gardener is to answer, verbatim, all impertinent, prying, and scrutinising questions that may be asked him as to his abilities and characture, in public and in private from the day of his birth untill the time he makes applycation for a situation. If so, it will be absolutely necessary to keep a journal or memorandum of incidents and occurrence, from early youth, while genus is in bud, to manhood and the meridiam of life, when it emerges and expands its accumulated knowledge with all the lofty excellence and subblimity of a Knight or a Perry. If a young man chooses gardening for his profession, he must be well versed in all the tecnicalities of science, in short, he must not be defective in any point of knowledge or mentel accomplishments; then I ask, how is he to aquire those indespenceble qualifications—not from an ordanary cource of education, as that is impossible; and few, comparatively speaking, have the means of giving their sons a classical education. Then, through all adverse circumstances and unpropetious fortune, he has to battle all difficulties untill he obtains that scope of knowledge ere he is equipt for a gardener. Then, for instance, suppose a gentleman applys for a gardener to Messrs. K. and P., a single-handed place, or one of minor import, of cource they cannot supply him with one, for non of their tallented men whould accept of such a situation. Again, if a man writes to K. and P. for a situation under them, and can dexterously wield his pen and smoothly write the incidents of his eventful life, in accordance with their wisely matured gage, he is considered a clever and skilful gardener; if, on the contrary, he is thought to be unskillful in his profession, and concequently not worthy of a place. What man of philanthrophy and impartiality will acquiess with thees living encyclopedias in carrying out such mean and illiberal measures! Again I ask why gardeners are to be under greater restrictions than any other class of men? After years of labour and studdy, practically and theoryeall, how is he remunerated? not as workmen of other professions are. 12s. per week is the sum he recieves for his industry and skill—as men of industry, respectability, and morrall conduct, with minds to penuitrate the misteres of his profession, he is no better paid than the common pot-boy. In other professions, any illiterate man, on an average, earns double the money a gardener earns. Then, in conclution, I hope the few remarks I have made may be rightly understood by all who peruse them, still keeping one object in view, that is, to endeavour to ameliorate the condition of journeymen gardeners. Then, if the feble efforts of my pen can in any way assist in so doing, it will be an unspeakable pleasure to your—*Well-Wisher.*"

What is to be said of such a man as this? He is one of those to whom our remarks apply, and we confidently put it to the good sense of gardeners whether they have been too severe.

Another correspondent from Streatham, to whom these remarks do *not* apply, has evidently misunderstood the objects of Messrs. KNIGHT and PERRY'S test questions, which we advise all gentlemen wanting gardeners to insist upon being answered. He alleges that "because two-thirds of the situations filled by nurserymen's recommendations, give from fifteen to twenty-one shillings per week, it is absurd to tell the public that gardeners ought to be all skilful in every department of gardening for such wages." Of course it would be most absurd to do so. But who does? Test questions are framed for the express purpose of enabling all classes of gardeners to obtain the wages that they are really entitled to; to prevent one man from passing for more and another for less than he is worth. Such an end they appear exactly calculated to attain; and it is for that reason we recommend them. We will just ask our Streatham friend, whether he would think it right to be degraded to the level of the man whose letter he has just read. Yet they are both gardeners, and we entertain no doubt that the "Well-wisher," as he calls himself, has the folly to imagine that he really belongs to the first class in his profession.

Of course workmen of all kinds are wanted, and must be provided, and there would be no common sense in expecting that a man who can only gain fifteen shillings a week should possess the qualifications of him who receives forty. In fact the man who is only worth labourer's wages is but a labourer himself, in spite of his blue apron and the name he gives himself; and nobody expects more of a labourer than honesty, sobriety, and good conduct. It is to persons obtaining gardeners' wages without possessing a gardener's qualifications; in fact, to labourers falsely calling themselves gardeners, that all which is severe in these remarks is addressed, and to them alone.

THE POLMAISE SYSTEM OF HEATING.

I BEG to offer the following statements relative to the working of warm air stoves in Vineries, and the effects produced upon the Vine by the circulation of the warm air through the house, as exemplified in the Vinery at Polmaise.

Several letters have already appeared in your columns respecting the good effects which the circulation of the warm air has upon the growth of the Vine, especially in producing large leaves with bunches of Grapes of an enormous size. The simplicity and cheapness of the system also render it superior to any plan that has been hitherto tried. In the plan of the house, which appeared at p. 500, 1844, it will be seen that the stove, which is made of malleable iron, is placed at the back of the Vinery, about the centre of the house, the warm air being introduced by an aperture in the back wall, a little above the level of the floor. In front of the aperture is a woollen cloth, three feet in breadth, extending nearly to each end of the house, and fixed to a wooden frame, leaning upon the wall above the aperture at about an angle of 45 degrees. On this frame are three shelves for plants in pots, such as Cactuses, &c.; on the upper shelf is a gutter for holding water supplied from a cistern at the end, from which is suspended woollen threads which conduct the water from the gutter to the cloth, and keep it constantly wet; the warm air passing beneath the cloth, and penetrating through it, enables it to throw off a moist vapour, and to produce a soft atmosphere.

At each end of the house is a valve to admit fresh air; this is conducted to the stove, and heated before it enters the house, and this constant supply keeps the atmosphere in a healthy unexhausted state. Much has hitherto been done in order to produce a natural atmosphere for the Vine within doors, but it is my belief that the Polmaise system is the nearest approach to nature of any system that has yet been tried. The atmosphere in the house is kept constantly in motion, similar to that in the external air. Plants consume air as well as man, and as the Vine is a rapid growing plant, we may ex-

peat that it will consume more air, or appropriate to itself more food from the atmosphere in a given time than many other plants. The feeding of plants, especially the Vine, by the leaves as well as by the roots, is a consideration deserving attention. What will the feeding of the roots do for the growth of the Vine if it has not a proper climate to grow in? And this can only be obtained in-doors by imitating, as closely as possible, Nature's laws. When we wish to grow healthy vigorous Vines, let them have plenty of fresh but warm air. Some chemists say that carbon is derived by plants principally, if not entirely, from the carbonic acid of the atmosphere; and, if this is the case, and as there exists so small a portion of it in the air (1 part in 1000 parts), then the more the leaves of the Vine are supplied by fresh quantities of it the better; this substance forming, as it does, the greater portion of the wood.

In regard to the fruit, from experience I can say that plenty of air and heat are most essential in giving colour and flavour to the Grape; the former is, however, counteracted, less or more, when the border is not in a proper condition; but if a natural climate is produced within (which can be obtained by the Polmaise system), the Vine will struggle against much of the opposition which its roots may have to encounter. The size of the bunches, as well as of the berries, produced at Polmaise for the last three years, has been the surprise of everybody who has seen them, some of the bunches weighing from 5 lbs. to 5¾ lbs. At the Caledonian Horticultural Society's competition last year, many of the most experienced gardeners were astonished at the Polmaise Grapes; some said that the Vines must be young to bring forth such large bunches, and this was the case; and, like all young plants, they produced larger bunches than old Vines. But in Vineries put up in the same year, the young Vines being like those planted at Polmaise, and the borders well made by men of much experience, the Grapes are much inferior to those at Polmaise. The cause of the difference of growth and produce is to be attributed, in my opinion, in a great degree to the continual circulation of air in the house.

I hope, before long, to see the same plan applied to the growth of the Melon and Cucumber; the former is a plant requiring a good deal of heat, with little moisture, being very subject to damping off at the neck, especially in dull weather; and I know of no better plan for remedying this evil than the adoption of the above system of heating.—*C.*

THE BRITISH EVERGREENS.

Reminiscences of Christmas festivities and associations of fireside comfort, and the happiness of our childhood, are of old connected with that cheerful British evergreen, the Holly (Ilex aquifolium); and long may it be [ere the early freshness of our inherited prepossessions shall be obliterated by the breath of that purely utilitarian spirit which seems to enlarge upon the view at every step of advancing civilization! Few trees have proved more fertile of poetical allusions than this deserving favourite; the observation of the spring lower leaves of a well-grown tree, contrasted with the smooth unarmed upper ones, is allusive to the calm, unruffled serenity which may pervade the higher arms and loftier associations of life, however rude and repulsive the thorny path may be which besets our feet; as though toil and vexation alone should be the basis of that peace we hope at last to enjoy. Nor has the poet neglected to note the shining gloss which at all seasons gives an air of cheerfulness to the green Holly, and whose summer months seem spent in the preparation of that fair garb, decked with scarlet, which enlivens it amidst the frosts and snows of winter:—

So serious should my youth appear among
The thoughtless throng;
So would I seem amidst the young and gay,
More grave than they,
That in my age I might as cheerful be
As the green winter of the Holly-tree.—*Southey.*

In an old carol of the time of Henry VI., we discover the key to the preference enjoyed by the Holly over the other English evergreen, the Ivy:—

Nay, Ivy, nay, it shall not be, I wys;
Let Holly hafe the maystry, as the maner is;
Holly stonde in the hall, fayre to behold;
Ivy stonde without the door—she is ful sore a-cold.

But the practice, according to Dr. Chandler, dates from a far higher antiquity than that. The Druids enjoined that the habitations of the Britons should be thickly garnished with Holly in the winter, in order that the spirits of the forests, driven from their sylvan shades by the nipping frosts, might take refuge within the foliage of the sheltered Holly until the sunny spring should return to court them back to their wonted abodes. Again, as a further remove into antiquity, Mr. J. P. Selby considers the practice to have been first introduced by the early Christians at Rome, where the Holly had long been used as an emblem of good wishes during the Saturnalia.

One of the finest forests of Britain, that of Needwood, contains great masses of noble Hollies, in such conspicuous bodies as to serve as well known land-marks (Darwin). The wood is hard and of a clear white, sometimes tinged with green; and as both the concentric rings and medullary rays are finely marked, it is very susceptible of being used for the ornamental woodwork known as Tunbridge ware.

The Ivy (Hedra helix), when well grown, is so ornamental an appendage as well to reward the trouble of planting it at the foot of large trees; and suspected as it is of doing injury by the closeness of its embrace, the question yet remains an open one. I am acquainted, for instance, with two very fine Plane-trees, growing side by side in the gardens of the Rectory at Pulborough, one densely covered with Ivy almost to its summit, and consequently unable to accomplish its annual shedding of bark; its neighbour growing unencumbered, and yet the trees are equally in fine condition, and put forth their leaves with equal vigour. In Parham Gardens there is a remarkably fine Poplar, about which is entwined a gigantic Ivy full 1½ feet in diameter; yet this overgrown dependent seems to exercise none of the usual injurious influence of a parasite. The Ivy is the last of British trees in flower. It blossoms in October and November; the berries ripen during the winter, and are ready for the birds in early spring, when hips and haws have disappeared. It is not unfrequent with the peasants of France to take 10 or 12 berries of Ivy, *pour se purger*; but their action is very violent.

It is not surprising that this very adhesive plant should have been adopted as a symbol of friendship. It is sometimes engraven on a seal, covering a fallen tree. "Even ruin cannot separate us;" or a twig of Ivy, with the motto, "I die where I attach myself." These affectionate professions call to mind the humorous maxim of the worthy Laird of Logan:—"Friends, like fiddlestrings, should not be screwed owre tight."—*F. A. Malleson, Pulborough.*

PLAN OF A SEED-PIT AT KEW.

The high terms in which gardeners have spoken of this house have induced me to offer the accompanying plan. I do this the more readily from knowing that several gardeners have expressed a desire to possess it. In the centre are delicate stove plants, and on each side pit seeds and young plants; besides being used in this way, the pit might also be employed as a Pine or Cucumber house, or for forcing Strawberries, Roses, &c.

Reference to Plan.—A, ground plan; B, transverse section; *c*, tanks, supported by the walls (*d*) at the joints; *e*, pipes; *f*, two cisterns which receive the water from the roof; *g*, three pillars which rest upon the walls which support the tanks; *h*, steps. The flow and return tanks are connected by a small pipe at *i*; *j*, walk. The water can be turned off the tanks by plugging up the pipes, and from the pipe round the centre pit by a valve.

In addition to the superiority of this over the generality of pits, in having a span roof, it also possesses the advantage of being heated on the tank system, by one of Burbidge and Healy's boilers, by which the water, though conveyed through 2-inch pipes in a covered drain about 110 feet from the boiler to the house, can be kept almost in a boiling state in the tanks. The capabilities of this boiler were fully proved during the severe weather of last winter, when not the least difficulty was found in maintaining a high temperature with very little fuel. The walk being continued round the house enables the gardener to reach any part without disturbing the plants.—*Chas. Walton.*

WINTER FLOWERS.

The Camellia.—Of all the tribes adapted to cheer the gloomy months of December and January, this when highly cultivated is one of the most useful, combining the character of a glossy and rich evergreen with the gay tints of the rose. I need say little in detail about the best mode of forcing the Camellia as the principles applied to the Azalea indica are for the most part equally applicable here.

Forcing into wood early in the previous year is the one grand principle on which all success with this, as a winter flower, must depend. If this principle is strictly pursued, and under a rather high temperature, combined with much atmospheric moisture (affording a full and free development of the latent energies of the plant), no midsummer or after growth will be produced. When the latter takes place, it is a sure sign that conflicting principles have been at work, through a somewhat capricious mode of treatment; that is, with regard to the ultimate object in view. Some persons advocate placing them out of doors in the end of summer. I am prepared to admit, that when the weather is genial and all is right at the root, this course may be conducive to size in the blossom; however, there is no real necessity for it. I never place mine out unless necessity compels me, and when such has been the case, damage of some kind has generally counterbalanced the benefits anticipated. My plan (and I have been very successful), is this:—First, to force them into wood with rapidity, the moment they show a tendency of their own accord to commence growth. Secondly, to lower the temperature (if possible), as soon as they cease to grow. Thirdly, to cut off in a considerable degree their supply of moisture at root during this stage. And lastly, to reverse in some degree the latter plan as soon as the stock in general have formed decided flower-buds.

All potting or shifting rendered imperatively necessary is performed by me shortly after they have ceased growing. Limitation of space precludes all possibility of showing here how the application of these principles produces the desired results: such, however, is the case, and those who follow them out, with plants possessing (as one of our best gardeners facetiously observes with regard to Pines) "live roots," will always ensure success. I may remark in regard to soils, in conclusion, that chopped turf of any kind will grow them in perfection if combined with a particular drainage and accompanied at proper periods by the uses of highly clarified liquid manures. I prefer unctuous loam two parts, sandy heath soil one part, in a somewhat fresh state, chopped and equally blended, to which I add most liberally coarse boiled bone and charcoal, with a little sharp sand.

Anomatheca cruenta, is an interesting little bulb, and although not a very early bloomer, may be easily had in beauty in abundance by the end of January: its treatment as to forcing may be the same as that of the Lachenalia. It is a plant which requires much water, and is liable to the red spider. By giving it very liberal treatment, however, and using much cool and tenacious loam in the compost, this propensity is easily overcome.

Phaius grandifolius, or Bletia Tankervillie of former days, a native of China, is a very noble and useful plant for the conservatory, if grown in a proper way. it is, moreover, when treated on genuine forcing principles, an early bloomer, and may be obtained under a high and moist atmosphere very easily by the early part of December. Like many of the terrestrial Orchids, it does not like to be severely disturbed through division of the root. However, if it must be divided, it should be accomplished early in the spring, with a view to the next winter's forcing. This plant revels in an unctuous soil, mixed with much charcoal. Equal parts greasy yellow loam, peat, and half-decomposed leaf-soil, with extra drainage, will grow it in high perfection, combined with a regular system of administering clear liquid manure. I will merely observe that any one who will treat this plant as he does his succession Pines, beginning with the month of February, and rapid growth the object, will succeed to his perfect satisfaction.

Francisceas.—These shrubs, more especially the Hopeana, will flower very well during winter or early spring under similar treatment to the Azalea indica. Young stock potted in the end of January, and grown with rapidity, will become, when under proper management, eligible for forcing in the ensuing November. The young plants, when growing very fast, should have their shoots frequently topped; and when they have become dense and neat little bushes, they should be taken from the excitement of the stove or propagating-house, and placed on a cool greenhouse shelf, with abundance of light and air. They always force the better for being pot-bound, provided in that state they can be well supplied with water, as thorough ripening of the wood is here a most important point. Let the soil be equal parts sound loam, sandy Heath-soil, and half-rotten leaf-mould, with plenty of charcoal just.

Justicia salicina.—This handsome little Peruvian

evergreen flowers naturally in September and October. It may, however, be retarded, so as to continue flowering until the middle of November. Cuttings struck in January and grown with rapidity, having recourse to frequent stopping, will make bushy and handsome plants by the early part of August, when the whole stock may be withdrawn from the stove, and placed on a comfortable greenhouse shelf for a while. After a few weeks here they may be introduced in succession to a warmer house, and when in blossom may be again retarded if necessary. A mixture of loam, leaf-soil, and peat, is well adapted for their cultivation.

Cytisus rhodopnæa or fragrans. — This charming winter shrub, when well blossomed, is so sweet, that one good bush will scent a large room. No establishment desirous of winter flowers should be without it; and it is especially the amateur's plant, being of very easy management. The young plants should be kept under high cultivation through the early part of the summer, and most frequently stopped at the growing points of the young wood. They should be in a somewhat pot bound state by the end of July, and should then be placed out of doors in a light situation, until the middle of September, when they should be placed in a very light part of a cool greenhouse. They will not bear strict forcing, being liable under a high temperature to "run to wood." They will, however, if managed as above, enjoy an intermediate climate in the early part of November, and will begin to blossom abundantly by the middle of December. The soil may be equal parts sound loam and sandy heath, with plenty of charcoal; I have grown them particularly fine, indeed, in one-half charcoal.—*Robert Errington, Oulton.*

FRUIT-TREE BORDERS.

Nothing can be of greater importance to a country gentleman than a flourishing and productive garden; and if proper means are allowed, there can be no reason why this should not be the case. True, there are adverse situations and soils, opposed in some degree to the quality of their productions; but gardening is an art, and he who aspires at a masterly knowledge of that art, by dexterity and perseverance renders every opposing object subservient to his skill. A thorough and enthusiastic cultivator of the soil reduces its obstinacy, corrects its barrenness, and causes the bark-bound stunted trees to assume a living and vigorous appearance. It may be assumed that these are hidden and abstruse matters which belong exclusively to science, but we deny it; good gardeners know all this, and bad ones should set about learning without delay. Let such begin by casting off their prejudices; let them take their stand by the side of the inquiring and industrious, and their course and success are alike clear.

All fruit trees, of whatever kind, should be planted on shallow ground, more especially if the quality of the soil is adhesive. As a first principle, the border should be dry; and, if not naturally so, drainage, complete and efficient, must be introduced. The drainage must, from its depth, entirely prevent the roots from getting beyond it. The soil between the drainage and the atmosphere should be rendered friable by exposure to the elements, and when it partakes of considerable tenacity I would urgently recommend an admixture of stones, flints, brickbats, or any similar material, say to the extent of one-fourth. These will enable the rains to percolate freely through the body of earth in which the roots are. They will also in dry weather hold moisture, and tend greatly to maintain the border in an equable state. The roots under such circumstances will be satisfactorily placed; no water can remain or be held in the soil sufficiently long to prove injurious, the stones intermixed with the soil will allow it freely to pass into the drainage beneath, where preparation must have been made for its passing readily off.

No kind of fruit-bearing tree should ever be planted deep, the proper position of the roots in planting is to stretch them carefully on the surface of the border, then to cover them loosely with soil to the depth of three inches; on this lay a slight covering of decayed leaves, merely to protect them from drying winds until the roots are perfectly established in the soil. The roots are certain to find their way downwards, but when they are down they are not so likely to find their way towards the surface.

Fruit tree borders should never be dug with the spade. The surface may be stirred and kept open with the fork, and then merely for the purpose of loosening the soil. The roots should be encouraged to the surface by the application of dressings of decomposed leaves. Wood-ashes will occasionally prove useful, and so will soot. These encourage the kind of wood likely to prove productive, and the produce is entirely different both as regards size and quality, from that when heavy dressings of stable manure are applied, particularly when the borders are imperfectly drained, and the soil of considerable adhesiveness. Manure dug into borders thus circumstanced is only increasing the evil. The soil is constantly wet and spongy. The roots are surrounded with unhealthy fluid; the air never penetrates beyond the surface; consequently, rank and barren wood, in large quantities, is annually, and to no useful purpose, produced. The roots should never be allowed, if it can possibly be avoided, to get beyond the reach of atmospheric influences. It is in such a position alone that they can procure and assimilate the kind of aliment indispensable to the fruitfulness of the trees. When the borders are imperfectly drained, the fruit produced is not only small in quantity, but of inferior quality, and not fit for dessert or kitchen use, compared with such as is grown on dry and healthy soil. Where the situation is bad, it should not by bad gardening be made worse; every means should be adopted to modify an evil, of itself of sufficient magnitude. I should hope that nobody would ever think of planting trees in future without a complete examination of the condition of the soil, and particularly the subsoil, in order, if necessary, to apply those remedies which skilful gardening may suggest; and surely there is sufficient skill and talent amongst us to meet, if brought into the field, all the exigencies of the case.—*One who has handled the Spade.*

ENTOMOLOGY.

Hepialus lupulinus (*the Garden-swift*).—This moth varies so exceedingly, that it has been described under many different names,* and as the English appellations of brown, silver, spotted-silver, tawny, and small swift, are only applicable to particular varieties, I shall, in future, employ the cognomen above proposed. About the end of May or the beginning of June, these moths may be seen hovering over meadows and grassy places in the evening, with a vaulting flight: from such localities the females wander to visit our gardens, dropping their eggs over Strawberry, Raspberry, and other beds, as well as about the flower borders. In all probability they do not long remain in this state before they produce caterpillars, which for their destructive habits are scarcely to be equalled by the surface grubs. I expect they are long-lived, as I find them in the autumn, winter, and spring, full grown, and it is remarkable that I should never have detected any much younger.

It was several years before I could rear the parent of this pest, which inhabited my garden near London as well as in the country. The first caterpillars I remember to have observed were found on the 3d of April, 1841, at the root of a Snowdrop, the bulb of which one had gnawed, and likewise the leaf; another had eaten through the root of the common Bear's-ear, and many Auricula plants in pots belonging to a friend, were destroyed by them. On the 12th of May one of my caterpillars appeared to be forming a cell under a tuft of Grass placed over it, but it eventually died, for want of moisture I apprehend. It was not long, however, before I had another opportunity of studying their economy, for on the 4th of June, I saw two Lettuce plants drooping, and on pulling them up, I found the tap root eaten through just below the crown, but occasionally they are divided much lower down,

and thus, every morning, my crop was reduced, by the most healthy plants having fallen a prey during the night. I then commenced clearing away the earth round the mutilated roots with a pointed stick, and by each plant I found a full-grown larva, about 5 or 6 inches deep in the soil. In November and December, 1844, these caterpillars were equally destructive to my young Cos Lettuces; they also ate the Parsnip roots, and on the last day of the year I dug up one which had formed a longish cell in the earth: the 27th of the following March I detected six in a Lettuce bed, exactly like the figure 1, only that the dots at the base of the hairs were obsolete; indeed they now appeared to be all unspotted. In April they again attacked the same border, and many more were found in some stiff soil where a crop of Lettuces had been grown. On the 1st of May I discovered three chrysalids and a few of the caterpillars about a foot deep under an old Strawberry-bed: they were all enclosed in very loose webs, adhering to particles of the mould. In June the moths were bred, but the unspotted larvæ were again detected the first week in November, at the Strawberry roots, just about to change to pupæ; on the 22nd I cut a spotted one out of the crown of a root of Celery, where it had formed a large hole, and a short time before one was sent to me by Mr. Edwin Brown, which he had taken from the centre of a Potato, in which it had eaten a winding burrow. I have been particular in recording these data, because the economy of the Garden-swift seems to be unknown, and never having received the caterpillar from any horticulturists, I expect it has hitherto eluded their search, owing to the depth at which it generally lives.

The caterpillars are cylindrical, yellowish-white, the head is brown and horny, with two minute antennæ; the first thoracic segment is horny and pale brown, the following segments have 4 dark dots on the back of each, producing bristles, with a greyish intestinal line between them, often blackish at the tail; there is a similar line of dots and hairs down each side, and beneath them the black spiracles, which are bristly; they have 6 pectoral, 8 abdominal, and 2 anal feet; fig. 1. They changed to a very sensitive, cylindrical pupa, ochreous and shining; the eyes, short horns and shorter proboscis, legs and wings, are distinctly visible through the skin; there is a tubercle on the forehead, and another on the face, with several bristles, the spiracles down the sides are blackish; the abdominal segments are very coarctate, with two transverse rows of sharp teeth on the back of each, and on the belly is a transverse broken ridge serving as analogues of the abdominal feet, with three bristles on each side, placed obliquely; there are also a few hairs about the spiracles; the penultimate segment has a broad transverse ridge very serrated, and the apex is tuberculated; fig. 2. The moth which came from them was named by Linnæus and Fabricius Hepialus lupulinus, its specific name implying that it is in some way connected with the Hop plant, but of this there is no evidence. The male is small, and when at rest sits with its wings deflexed, as at fig. 3, the horns being often concealed. It is of a chalky-brown colour; the eyes are very black, and almost concealed by its woolly head and thorax: the horns are very short and simply tapering, of a bright ochreous colour; the abdomen is attenuated, but obtuse: the superior wings are of a darker bright brown, more or less rusty, with a white spot beneath the costa and not far removed from the base; there is an irregular white stripe along the inner margin at the base, which forms an angle at the centre, and then takes an oblique direction to the apex, the dark nervures forming it into various irregular white spots; along the posterior margin is also a row of semi-oval white spots, less distinct; the inferior wings are long, narrow, and of a uniform brown colour; the fringe is short. In some varieties the wings are entirely brown, in others chalky-white, with scarcely a trace of the spots remaining: the female is much larger (as shown by the upper-wing, fig. 4); it is very like the male, but the white stripes are often broader and the body is much stouter. Sometimes the moths appear the end of May, but mine did not hatch this year until the first week in June, and it is a singular circumstance that they were all males.—*Auricula.*

* Vide Curtis's Brit. Ent., fol. and pl. 186: and the Guide Genus, 791.

CONDITIONS OF SOIL FOR PLANTS IN POTS.

1. An essential condition of soil for the growth of plants in pots, consists in its possessing a degree of mechanical force (by its texture and arrangement), equivalent to its bulk, and the amount of nutritive matter which it contains, or is capable of absorbing, during the entire growth of the plants.

2. By mechanical force in soil, I mean an arrangement of its parts, or layers (in potting), capable of maintaining a given distance during the progressive growth of the plant. For instance, a porous texture will admit a quicker passage of water throughout its bulk for a greater length of time than a quality which is less so;—again, of two equal-sized flower-pots, one having two inches of drainage, and the other four inches, the degree of force maintained in the passage of fluid upon the latter will be greater than that in the former. The ratio of circulation being in proportion to the degree of porosity, and *vice versâ*.

3. The object of maintaining a due relation between the mechanical and chemical conditions of soil is, to secure a uniform circulation of moisture, by means of which plants are enabled to assimilate food in proportion as the chemical elements are held in solution, for a period equal to the power of secretion in the plants. As a general rule, the chemical properties of soil derive their mean force from those forces which act mechanically upon them, in connection with light, air, &c.

4. The relation which mechanical force (by draining, &c.) should bear to the chemical or nutritive properties of soil is governed, 1st, by its absorbent quality;—2dly, by its bulk;—3dly, by the structural adaptation of plants for secreting fluid;—4thly, by the uniform vigour of the plants;—5thly, by the extent of growth required in a given period, and 6thly, by the amount of exposure to light, air, heat, &c.

5. The absorbent quality of soil is generally in proportion to the amount of vegetable fibre which it contains in various states of decomposition; the higher the decomposition the lower is the absorbent quality, and *vice versâ*.

6 The general means of modifying the absorbent quality of soil, are, 1st, by a higher decomposition of its vegetable fibre; and 2dly, by exposure to a dry temperature previously to its being used. The first preparation lessens its porosity; the second enables it to retain its mechanical or porous texture, but lessens its power of preserving moisture beyond a given period. A medium or equal degree of each is essential in all preparations of soil (for pot-culture), each degree being regulated by the conditions under 4 and 14.

7 The lower the absorbent quality of soil, the greater is its mechanical fitness for the growth of plants generally; but especially under a deficient exposure to light, air, heat, &c.

8. The lower the absorbent quality of soil, the greater is its mechanical fitness for circulating fertilising fluids.

9. The lower the absorbent quality of soil, the greater is its mechanical fitness for the production of growth favourable to fertility.

10. The lower the absorbent quality of soil for plants in pots, the greater is its mechanical fitness for resisting an excessive application of water to their roots, and *vice versâ*.

11. The lower the absorbent quality of soil the greater is its mechanical fitness for receiving the most intense action of light, air, heat, &c., and *vice versâ*.

12. The lower the absorbent quality of soil the greater is its mechanical fitness for the growth of plants, when excessively impaired in vigour by long ex-

posure to, or exclusion from, light, air, &c., and *vice versa*.

13. The lower the absorbent quality of soil the greater is its mechanical fitness for the growth of plants when re-shifted; and this to an amount greatly disproportioned to their mean, or existing vigour, and *vice versa*.

14. The lower the absorbent quality of soil the greater is its mechanical fitness for the growth of plants distinguished for rapid circulation of sap; and for assimilating food from vegetable matter in a partially gross state. It also enables them to withstand alternations of drought and moisture, with exposure to intense sunlight, and *vice versa*.

15. The lower the absorbent quality of soil the greater is its mechanical fitness for the growth of plants, (requiring a dry and low temperature), in indifferently ventilated greenhouses, &c., or when placed upon stages, or platforms, considerably below the level (or access) of side-light, and *vice versa*.

16. As the shifting of plants progressively from smaller to large pots, is contrary to their natural conditions of growth; 1st, by counteracting the lateral expansion of their rootlets; 2dly, by impeding the circulation of sap; 3dly, by hastening a premature maturity of growth, which is inseparably connected with impaired constitutional vigour; 4thly, by exposing them to repeated extremes of temperature by exclusion of air, light, &c, and by applications of water to their roots, when, by their disarrangement they are the least capable of imbibing it; and, 5thly, by causing an excessive evaporation from their pores—the following rule may be deduced: that the general adaptation of soil for superseding the shifting of plants from smaller to larger pots, consists in its porous texture and mechanical arrangement being duly proportioned to its bulk, in connection with an exposure to intense light, air, heat, &c., and *vice versa*.

17. All preparations of soil for potting should be sufficiently moist to dispense with immediate watering, when the plants are newly shifted (the plants being watered previously to the operation), in order to modify the absorbent quality of the newly-added soil, by a partial exposure to the air, &c., and to secure an equality of moisture between the old ball and that which surrounds it.

18. In all cases of newly-potted plants, when, by the disarrangement of their roots, they are rendered incapable of deriving benefit from newly-added soil, their loss of vigour is compensated for by a partial exclusion of air and sunlight, together with an increased humidity and temperature for a proper period.—*William Wood, Pine-apple-place.*

Home Correspondence.

Pruning Forest Trees.—In last Number, "C.W. H." has given about two columns on "Forest Pruning," the sum of which appears to be merely this, that "the great object, in fact, in pruning trees intended for the saw, is to prevent dead knots." There are, however, some sensible remarks in "C. W. H's" essay, and accordant with nature and the reason of the thing, but for all that we have nothing but what was well known before. In former communications I have deprecated all "systems" of forest pruning, when the object sought is the greatest amount of good timber in the shortest time, for, as "C. W. H." justly observes, "cut off a branch, or a whole tier of branches, and you reduce considerably the immediate increase or girth in the stem below." Again, "Now, if the roots of a tree correspond to the quantity of leaves above, if you cut off a branch you leave a superabundance of root power" &c. &c. This is a fact, but I would ask "C. W. H.," who is a physiologist, whether that superabundant "root power" would be exerted with the like force when deprived of the leaves essential to reciprocal action? I trow not; for, however the process he designates "anastomose" may operate, there is still a derangement of that reciprocity, and balance of influence and action between roots and leaves, that operates as a check upon increase. I have founded all my former arguments on this subject on the plain common-sense principle of reciprocity; physiological disquisitions are here unnecessary, and I think I may claim "C. W. H." as a coadjutor. Forest woods, or plantations for the produce of timber trees, if properly thinned, will never require any large living branches, nor dead ones either, to be amputated. It is known to all your readers who have attended to this subject, that I have heretofore deprecated all pruning save giving young trees a direction upwards, by removing a rival leader, &c, and I would as strenuously recommend the removal of all dead and dying under branches close to the stem. I have commended Dr. Thackeray for his unremitting attention to his plantations at Nerquis, though I disapprove of his pruning. There is another matter connected with this subject worthy of attention: suppose I were an advocate for pruning, or, rather, suppose "C. W. H." had a forest of from 200 to 500 acres to prune, and wished the process conducted exactly according to his own, say physiological principles, he might perhaps find it necessary to employ 20 or more working men; could he inspire them all with his own ideas! Could he get them all to work, each man at his tree, with its physiological structure and functions ever present to his mind? The thing is practically impossible. It is all very well to write physiologically about the cambium, and the alburnum, and the liber, and the "anastomosing process," &c., but how are workmen in smock frocks to act upon it? Let us have nature and common sense, and nothing else is wanted to lead to a proper and successful practice.—*Quercus.*

Gooseberry Caterpillars; and Sulphur v. Rabbits.—At p. 21 it was mentioned that dusting Gooseberry bushes with soot in spring had the effect of preventing the caterpillar attacking them during that season. I dusted all my bushes heavily twice last spring, as directed, and I have never before found the caterpillar so severe on them, as it was last season. Again, at p. 117 it is said, that placing rags dipped in sulphur on sticks in the ground three yards asunder, had the effect of preventing hares and rabbits from barking Apple-trees. I have put up the sulphur rags on sticks as directed, but the trees are nevertheless as much barked as ever they were in former years. Now I beg to ask the reason why these two receipts have entirely failed with me, when they were stated to be effectual remedies.—*J. T.* [Perhaps those correspondents who furnished the original information will supply the answers now asked for.]

Heating and Ventilating (see p. 858).—Mr. Henderson by experiment would find that by allowing the cold air to escape at a higher level, the rapidity of circulation would be exclusively governed by the difference of

density at the two points A and B., and supposing the inverse were the positions adopted to those suggested by Mr. H., the air would pass rapidly notwithstanding, if not even at a greater rate.—*R. Glendinning.*

Cements.—I should feel obliged if any of your correspondents could inform me if India-rubber can be successfully used to render slate cisterns water-tight? I want well-water to run into them, and have an objection to white-lead.—*A Subscriber.*

Plan of Securing Single Trees in Pleasure Grounds.—I have always observed that the old fashioned plan of protecting trees in pleasure grounds was open to many objections. In the first place, a great deal of wood was consumed in barricading each tree; the workmanship was expensive; sheep could not feed near the roots, consequently the Grass grew too high; besides, it was no protection against wind; in ramming down a long pole, the roots of the tree would be injured; besides, when the pole yielded to the wind it became a dead weight upon the tree, instead of a support; in tying bunches of thorns round the root and stem, the current of air was obstructed, and the tree smothered. Having occasion to transplant a great many trees from 20 to 25 feet high this autumn, and being dissatisfied with the old system, I have adopted the mode represented by the accompanying woodcut. It is simply a piece of Fir, from 6 to 10 inches long, according to the size of the tree to be protected; it is split in two, then hollowed out sufficiently for the tree to be at perfect liberty when surrounded by it; each part is put on one side of the stem, about 4 or 5 feet from the ground; it is then secured by a piece of wire, twisted tightly round it, but a groove sawed in the wood to prevent its projecting,

which would prevent the oblique supporters going close to it; these supporters are then nailed on to the wooden ring, and the other end fixed into the ground. From three to six supporters might be used, according to the situation. I find that cattle do not like to come near trees supported in this manner. This hollow tube ought to be a trifle larger at the top than at the bottom, to prevent the tree being chafed in a high wind.—*J. D.*

Landscape Gardening.—At p. 836 "J. W." recommends young gardeners to lay aside the rule and compass, and to take colours, canvass, &c., and learn to imitate Nature (the rule and compass being useless for that purpose), anticipating that an improvement in landscape gardening would consequently follow. Now, this is all very well if it could be accomplished; but when we consider the many disadvantages under which young gardeners labour, and even the manner in which they in general are remunerated for their services, a practical knowledge of the fine arts is surely too much to expect from them; not but what it would be very desirable for gardeners to possess such a knowledge, but it ought to be considered more as an accomplishment than a qualification which they ought necessarily to possess. On the other hand, however, I would earnestly recommend that instead of laying aside the rule and compass, they should study the use of them well; for every gardener ought to be able to give plans for, and to superintend the erection of horticultural buildings of every description. For if these constructions be erected on wrong principles (which is too often the case) the gardener who has the management of them is generally the first sufferer; for, if the plants, &c., under his charge indicate by their appearance that something is wrong, it is more likely to be attributed to mismanagement on his part than to the bad construction of the house they inhabit; too many gardeners know unfortunately what it is to labour under the disadvantages of a deficiency of ventilation, heating, &c.—*G.* [We nearly agree with "G.'s" remarks. Landscape gardening, if not a mere accomplishment, is at least a subject which only persons having great opportunites can profitably study. We would say, study *well* the rule and compass; and learn how to make good geometrical gardens rather than bad landscape ones. Fifty, nay five hundred of the former are wanted for one of the latter; and no greater mistake has been committed than discarding, so much as has been the case, the fine old plans of geometrical gardens. The barbarous things that we now see in small places are usually miserable attempts at compromise between the picturesque and the symmetrical—an elephant's head upon a monkey's shoulders.]

Natural Classification of Plants.—If not drawing too far upon your liberality in answering questions, I would beg for some information upon a subject which must be of great interest to most of your readers—I allude to the natural classification of the Vegetable Kingdom. I am most anxious to know whether any prospect is entertained by eminent botanists of their being able to arrange plants according to the system of Macleay—so successfully applied by him to insects, by Vigors to birds, and by Swainson to quadrupeds. I am the rather induced to seek this information, as the outlines of your natural system of botany come nearer to a coincidence with what is really valuable in Macleay's system than any other. It has always appeared to me that a great impediment to the progress of the latter system has arisen from the attempt to arrange all natural families in circles, and to fix too hastily any one number of such families, as that adopted by Nature. It is obvious that such families might just as well be disposed in any other figures, or in right lines, or that, for all we can tell, the microscopic beings may afford reasons for altering any assumed number. This has given too ambitious an air to the whole. It is unphilosophical, too, and brings incredulity along with it. Laying aside, therefore, such matters, as being, to say the least of them, unnecessary, it seems that the really useful and valuable principles of the system are as follows:—1st, That all organised beings are divisible into certain great primary groups, each of which is again divisible into others. 2dly, That one of these—the normal group—always possesses a more perfect degree of the common structure than the others, which are in that respect more or less aberrant from the normal type. 3dly, That each group possesses a distinct character—in its own modification of the common structure—which re-appears again in each corresponding group, as we descend in the process of subdivision, each successive normal group representing, as it were, the original normal type, and each aberrant group the original aberrant type. 4thly, That every set of groups in each division are analogous to the corresponding set of groups in each other division. That these principles can only be ascertained by observation is of course undeniable. But a few general remarks upon their *rationale* will make what is observed more intelligible. It is obvious that the material world presents itself to us under two grand divisions of organic and inorganic matter—that the former divides itself into the Animal and Vegetable Kingdoms—and that the latter divides itself into the palpable forms of Air, Earth, and Water; or at least, into three forms of which those are the types. It is from the adaptation of one of these worlds to the other that order seems to arise. Nature has made nothing in vain. It follows, therefore, that every condition of the inorganic world is probably intended to meet an equally varied condition of the organic world—for the one is to subsist upon the other. Thus, the uniformity of the one fixes the uniformity of the other. We can in this way understand how it is that Nature has pursued one plan in the Creation—how, in a word, having once laid down certain original principles of structure, all the endless variety we meet is but an endless modification of these. Again, we may assume, on general consent, that every organised being exhibits a creative design—an adaptation of means to an end. Hence, as everything done by Nature is on the best plan, and we cannot conceive two best plans, we must expect to discover a constant repetition of analogous modes of attaining analogous objects. This consideration at once leads us to look for analogies between groups of the same, and even of different kingdoms. He who admits the perfect adaptation of the camel to his position in the desert, will not be surprised to observe the resemblance it bears to the ostrich—each being equally suited to the same circumstances. He who admits the perfect adaptation of the wading bird to its position in the marsh, will not be surprised to discover its analogy to perhaps the tall stuff like Rush or Reed, each being destined to maintain their existence under similar circumstances. I dwell upon this principle because it does not appear to me to have been put forward for the same purpose by any of the writers to whom I have referred, and it is in fact the true basis of the whole system. It explains analogies which might otherwise appear fanciful, and it goes far to determine

the number of groups of the same rank existing in nature. Our observation may be deceived upon the more complicated side of the picture; but we can hardly be mistaken on the other side, as the inorganic world presents us only with the three conditions I have noticed—air, earth, and water; or, at most, with these and two other intermediate or mixed conditions, giving rise to a parasitic or climbing type between the two first, and to an amphibious one between the two last. Zoologists appear to have clearly made out an aerial, a parasitical, a terrestrial, an amphibious, and an aquatic group, allocated to as many distinct modes of existence. We are thus led to expect three or five natural groups, whose organic functions are suited to derive their subsistence from these three or five sources or mediums of animal and vegetable life. We accordingly find that the animal kingdom presents us with a normal group of vertebrate animals, and with several invertebrate or aberrant groups, viz., the Annuloss,or insects—the Molluscа, or shell-fish—the Radiata, or star-fish—and the Acrita, or polypes. Nothing can be clearer than the expression of a terrestrial character in the first, and of an aerial one in the second; whilst an aquatic one seems more or less to pervade the last three. It would be beyond my purpose to examine here the intermediate types. I will therefore only notice the above three most conspicuous ones. Turning now to the Vegetable Kingdom, we find a normal group of exogenous plants, whose bony structure and vascular system exhibit a striking analogy to the vertebrate animals; and several aberrant groups, of which the Endogenous plants are equally analogous to the Annulose animals; whilst, as in the Animal Kingdom, an aquatic character seems more or less to pervade the others. The same principle seems to discover itself in every minor group. In the Cryptogamic plants, which appear to be the aquatic type amongst those of the same rank, we have an aerial group in the Musci, &c.; a terrestrial one in the Filices; and an aquatic one in the Algæ; with, perhaps, intermediate groups, exhibiting the amphibious type in the Equisetaceæ, and the climbing, parasitic, or creeping type in the Fungi. The eye of the botanist will see many more evidences of this plan in every part of the Vegetable Kingdom. I only notice them thus far, in the hope of learning from you whether they exist universally. If they do, and if the present Orders and Classes are really natural, that is, according to their vegetative, and not merely according to their re-productive organs, it would only remain to dispose and define them, so as to exhibit the above relations. I need not dwell upon the advantage of such a classification, if admitted by Nature. It would necessarily express every vegetative function in the simplest form, according to their uses; it would be a classification, not according to the imperfect discrimination of man, but according to the beneficent designs of Providence, manifested in the uniform adaptation of each plant to the sources from which it is to derive its subsistence.—*Student.*

Societies.

STAMFORD HILL, CLAPTON, AND STOKE NEWINGTON GARDENERS' ASSOCIATION.

Nov. 24.—Mr. W. Williams in the chair. Mr. C. Tant, gr. to E. Johnstone, Esq., read the following paper on the Chinese Chrysanthemum:—For many years, says Mr. Tant, after the introduction of this fine autumnal flower, which was about the year 1790, the sorts cultivated were only the small-flowered and earliest, the predominant colours of which were buff, yellow, rose, and white. Ripe seed could but rarely be obtained in the neighbourhood of London; and the Chrysanthemum appearing to offer but little facility for improvement, became neglected or gave place to gayer rivals; but about the year 1820 it appears to have attracted the attention of German and French cultivators. In their dryer climate seed was abundantly produced, and from them and from Jersey, and other channel islands, many sorts of superior size and colour were obtained. From the above date to the present time continual additions have been made to the varieties of this beautiful tribe of plants, among which there exists as perfect symmetry of form and vivid colouring as in any other class of flowers.

Chrysanthemums, for flowering in the open air, succeed best when planted against a wall with a due south aspect; they should be trained so as to completely cover the space allotted to them, the leading branches only being nailed close in, and the laterals of short growth suffered to hang loosely; every bud may be allowed to remain on. They flourish best when copiously supplied with water, and mulching or liquid manure, if the soil is poor, are necessary. Only the earliest flowers should be used for this purpose; among the best of which are Formosa, Tasselled Yellow, Princess Marie, Minerva, Lucidum, David, Queen, Victory, and Flechier; the colours appear to most advantage when contrasted as strongly as possible. For pot-culture the soil should consist of good top-spit loam of a porous character, well mixed with one-fourth its bulk of well-reduced stable manure: the remains of an old Mushroom bed answers well for the latter; a little sand may be added if the loam is deficient in that material. If very dwarf plants in small pots are required, they may be obtained by laying the points of young shoots in the month of August. As soon as well rooted, these should be potted into 5 or 6-inch pots, shaded for a few days, and, when the pots are filled with roots, supplied with liquid manure once a week until the time of flowering. Only the earliest and most certain bloomers should be chosen for this, such, for example, as are named in the last list. Another mode of obtaining dwarf plants, when of earlier and stronger growth, is by coiling or training down the stems as they advance, either to a trellis or short stakes; this, if cleverly done, exhibits plants with foliage down to the pots, and a considerable display of bloom; but is so much the reverse of the rigid erect habit of the plant as to rarely or never produce a graceful effect or first-rate flowers. The practice of growing dwarf plants can only be recommended to those persons who have no accommodation for tall ones. As perfect flowers are my object, if I can get these with a healthy foliage and firm stem I am satisfied, whatever may be the height of the plant. In growing a Myrtle or Cape Heath, a compact bushy plant is preferred; in an Orange or Lemon, the fruit, and in a Cockscomb, an enormously enlarged receptacle; but in the Chrysanthemum, perfect flowers are the ultimate object. To obtain these, the utmost development of stem, leaf, and bud is required; with this end in view the following has been my most successful plan of treating them, whether as ornamental specimens or for exhibition:—From the latest and shyest bloomers, such as Two-coloured Incurved, Perfection, Tasselled Crimson, and Aristides, I take cuttings in September, strike them in the usual way, and keep them in small pots till the following spring; of all other kinds, I take root-cuttings, or suckers, in the end of February, strike them on a slight hotbed, and afterwards harden them to the open air; rearing of the most slender growers, such as Formosa, Lucidum, or Campestrini, three plants in a 5-inch pot; the more robust, such as Princess Marie, Goliath, King, &c., are potted singly; when these pots are well filled with roots, I shift them at once into 11-inch pots, or those in which they are to bloom, using 1 inch depth of drainage and the compost before mentioned, only filling the pots to within 1½ inch of the rims, to allow room for a top-dressing in August; this practice I find to be far better than repeated shifts. Plunging the pots during hot weather in old tan or leaf-mould (in which salt is strewn, to check the worms) is highly beneficial; the plants stand thin in an open spot of ground, and a plentiful supply of water is given throughout their whole growth. I never stop a shoot in any stage of its existence; the practice is highly injurious even to the freest bloomers, while the flower-buds of the large, late varieties would be utterly destroyed by it. To obtain first-rate blooms, thinning the buds is essential; the central, or other most promising, only being left on each shoot.

I have generally from 10 flowers to 50 and upwards on each plant. After the roots have fully filled the pots (including the top dressing, and not till then), a little guano, or liquid manure, is applied once a week; this preserves the foliage, and invigorates the whole plant.

The following list contains what Mr. Tant considers the best varieties in cultivation; they are placed in the order in which they come into bloom:—

Earliest.	*Medium.*	Columbus
Imperial	Louis Philippe	Campestrini
Princess Marie	Pulcherrima	*Latest.*
Queen	Napoleon	Celestial
Formosa	Defiance	Two-coloured Incurved
Tasselled Yellow	Minerva	Orion
Vesta	Goliath	King
David	Memnon	Tasselled Crimson
Lucidum	Duc de Calineau	Perfection
Gem	Victory	Grandis
Bethulia	Mirabile	Chancellor
Marquess	Exquisite	

Mr. Tant exhibited a stand of most beautiful blooms of the following varieties: Formosa, King, Superb Clustered Yellow, Vesta, Goliath, Beauty, Imperial, Pulcherrima, Princess Marie, Minerva, Campestrini, Incomparable, Orion, and Bethulia.—Mr. M'Elroy stated that the water from a cesspool, containing the drainings from a cowhouse, was an excellent liquid manure for Chrysanthemums.—Mr. Sherwood had, for the sake of experiment, stopped the shoots of several of his plants twice during the past spring and summer; the results were, dwarf healthy-looking plants, small flowers on the freest bloomers, and on the late ones no flowers at all.—Mr. Croxford, after his plants had filled the blooming pots with roots, plunged them in the open ground, in order that the roots might run over the rims into the rotten dung placed above and around them. He took them up when near blooming, and placed them in a pit or raised frame until the flowers were expanded; if well supplied with water, their removal from the ground did not injure them in the least.—*W. Sherwood, Hon. Secretary.*

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

This Society held its tenth Anniversary Meeting, on Monday the 22nd inst., at the Horns Tavern, Kennington; James Coppock, Esq. in the chair. The Chairman opened the Proceedings by reading the Report of the Committee and Auditors, with the Tresurer's account, which was agreed to and adopted The Auditors say, "We have examined the accounts of the Society, and find that the liabilities are Nil; the balance remaining in the Treasurer's hands £13 2*s.* 1*d.*; and the value of medals in hand, unawarded, £8." The following gentlemen were then elected officers for the ensuing year;—John Bright, Esq., Treasurer; for the Committee, consisting of 12 Amateurs, J. P. Burnard, Esq., J. Beetham, James Coppock, John Chapman, W. Davis, J. E. Hadow, G. Jeffs, T. J. Pring, M. Sangster, R. Seldon, W. Sandiland, and W. Trahar; 6 Nurserymen, Mr. R. Atlee, J. Bushell, James Dickson, John Dickson, Joseph Fairbairn, and W. Ivery; 6 Gentlemen's Gardeners, Mr. W. P. Ayres, J. Bance, P. N. Don, C. Embleton, E. A. Hamp, and G. Young; for Auditors, W. Moates, T. C. Wildman, and J. Dutson, Esq. A society like this is deserving of the warmest support of every lover of floriculture, for while the handsome and numerous prizes they have offered at their five shows this year have drawn together exhibitions which would not have disgraced the most powerful societies, by adhering to their plan of paying the prizes as soon as awarded, they will at all times command the efforts and the emulation of the best growers; this is much for any local society to do, and we are glad to find from the unanimity and good feeling which prevailed at the meeting, that the zealous and persevering efforts of the Committee for the past year were well appreciated by the members of the Society. Several extra prizes of 5*l.*, 3*l.*, 1*l.* 11*s.* 6*d.*, 2*l.*, &c., were offered principally by amateurs, and everything promises a brilliant campaign for the ensuing year. Five shows were announced among the arrangements already settled, the first to take place in April, at the Horns tavern, and the four following at the Royal Surrey Zoological Gardens, in May, June, July, and September.

Rebuhs.

Hortus Vanhouttianus; ou Description de Plantes Nouvelles, Rares, ou Peu Connues, introduites dans les Jardins de Louis Van Houtte, &c. Vol. I. Part I. Ghent: 1835. 8vo.

This work is intended to appear about six times a year, and will give an account of the new plants which may be for sale in the extensive nursery of Mr. Van Houtte, of Ghent. It is given to his customers and sold to the public. We have two of Mr. Van Houtte's latest catalogues before us, and we certainly think that they promise an abundance of materials for his periodical. Many of the names are new to us. Others are those of plants very little known; and we understand that a large number of imported species at present undetermined, are necessarily omitted from the catalogue. Some account of the beautiful Alströmerias in this nursery was given by the Dean of Manchester, at p. 607. Specimens were subsequently exhibited to the Horticultural Society in Regent-street. We have ourselves received many species for examination which attest the richness of the collection. It was from this source that Habrothamnus fasciculatus, and we believe Cuphea strigillosa, first found their way to this country; and upon the whole we think that the course which Mr. Van Houtte has taken for bringing his plants more prominently into notice, is likely to be deserving of support from the public.

The new plants for sale are either figured or described in a really scientific as well as popular manner, or both; and therefore the world is able to judge of the accuracy of the names by which they are designated. This is a most important thing for buyers, who are by this time thoroughly tired of the endless disappointments to which they are doomed by the bad system, adopted by certain nurserymen, of applying some fancy name of their own to their plants, without giving themselves the smallest trouble to ascertain whether they may not already have received a dozen others.

The work is written in French: the plates are well executed in lithography. The Number before us contains figures of Thunbergia fastuosa, Mussænda Afzelii, Amorphophallus leonensis, Gunnera scabra, and a bird's-eye view of the grounds and houses of this enterprising nurseryman. A good many new plants are also described. We shall endeavour occasionally to draw attention to the novelties and to ascertain how far they are absolutely new. But the latter is a very difficult task, and can only be done with more spare time than we at present possess.

New Plant.

Anthocercis ilicifolia. Holly-leaved Anthocercis. (*Greenhouse Perennial.*) Scrophularineæ. Didynamia Angiospermia.—A species, in colour and general habit, nearly allied to the showy A. littorea, but very distinct, and remarkable for its size, often 6 feet in height, and its very long twiggy branches, leafy below, terminating in elongated compound spikes of graceful pendent yellow flowers, the inside of the widely campanulate tube of which is elegantly marked with dark blood-coloured lines. It was first detected at the Swan River settlement by Mr. Fraser, who speaks of it as general on the river banks, and afterwards sent to us by Mr. J. Drummond. The plant requires a warm greenhouse in the winter; but in summer, during the flowering season, a cooler place, with a plentiful admission of air, will be the best suited to it.—*Botanical Magazine.*

Miscellaneous.

Extracts from a Report by Mr. Gardner on the Royal Botanic Garden in Ceylon; dated August, 1844.—Besides the staple articles cultivated at present for commercial purposes, such as Coffee, Sugar, Cinnamon, Cotton, &c., there are many other productions peculiar to tropical countries which might be cultivated on a large scale in the island, not only with profit to the agriculturist, but as a source of increase to the public revenue. As the introduction of novelties, however, is generally attended with much difficulty, and no little expense, when undertaken by private individuals, few interest themselves with such matters. Fearful of failure they remain contented with what they have been accustomed to cultivate. Even after their introduction experiments require to be made with regard to the soil best adapted to their growth—the most effectual and rapid method of propagating them, and the amount of

produce compared with the expense of labour bestowed thereon. It is only an institution maintained at the public expense which is able to undertake in an efficient manner the investigation of such matters. Apart from the productions which might be cultivated on a large scale, there are others which are not only highly essential to the domestic comfort of every colonist, but which might be made a source of profit to the less wealthy European settlers and natives residing in the vicinity of towns: I mean fruit, vegetables, and fodder for stock. Nothing surprised me more, on my arrival in the island, than the inferior quality of those articles, particularly the fruits, compared with those I have been accustomed to in other tropical countries, and the inattention which prevails among almost all classes with regard to their improvement. A colonial botanic garden should be allowed the means of introducing from other countries the best qualities of fruits, vegetables, and other useful productions, and be a nursery for their propagation, their amelioration, and their diffusion through the colony.—It is a remarkable, but not the less a true circumstance, that of all the British possessions in India, the vegetation of Ceylon is the least known to the botanists of Europe; and that most of what is known is the result of the investigations of a lady—the accomplished and indefatigable Mrs. Col. Walker. The reason why other parts of India are better known has no doubt been the liberality of the East India Company in maintaining numerous collectors and draughtsmen in various parts of their territories, under the direction of the superintendents of their botanical gardens, who have almost always been well-educated medical men, and passionately devoted to the furtherance of their favourite science.—Another, and a very important manner in which a tropical colonial botanic garden may be of use to the mother country, is the observations and experiments which may be carried on regarding the temperature of the earth and air, the amount of moisture suspended in the atmosphere, the quantity of rain which falls, and the intensity of the solar light, all of which are most important matters to be known by those who are endeavouring to cultivate the fruits and other vegetable productions of tropical countries in the hothouses of England.—Much requires to be done before the part now under cultivation can be made to assume the appearance it ought to have. On my arrival at Peradenia I found nearly all the principal borders and other parts overrun with white ant-hills, most of them several feet in height, and consequently very offensive to the eye, as well as injurious to the plants. My first business was to employ a number of men to root them out, which I am happy to say has now nearly been accomplished, and care shall be taken in future that they be destroyed as they make their appearance. Many of the walks require to be thoroughly cleared of the mass of weeds by which they are now overrun, and re-laid with gravel. The only one out of the cultivated portion which it is my intention to keep up, is the continuation of the great central one down to the river, and from thence up the stream to the upper part of the garden, so that there may be a carriage drive round at least the greater half of the whole grounds. For the last 12 months the garden has been deprived of its usual supply of water in consequence of the water-course having been allowed to get out of repair. This was found to be a serious evil during the drought which occurred in the months of May and June. Now, however, that the rains have set in, it is not so much felt; but I would urge on his Excellency the necessity of having the course put into a substantial state of repair, previous to the occurrence of much dry weather.—Much has been talked about the necessity of having all the plants in the garden arranged according to some scientific plan of classification. This, which is a very desirable thing to have adopted in a garden belonging to a university or a medical school, I do not consider to be at all necessary either for increasing the beauty or utility of such a garden as this. Indeed, the more mixed ornamental plants are, the more pleasing are they to the eye of those especially who are not initiated into the mysteries of botanical affinities. A more important object will be to have the botanical name of each plant attached to it.—On my arrival at Peradenia I was not a little astonished to find that a large portion of the Botanic Garden had a few months previously been converted into a market garden, in which nearly one-third of the labourers allowed for the entire operations were daily occupied. Indeed, I may say that at that period nearly double the number mentioned were engaged in this department. As the drought was then excessive, and the watercourse out of repair, 10 men were constantly occupied in carrying water from the river, the greater part of which was used in the kitchen garden. I likewise found that another man with a bullock-cart was daily sent to Kandy with vegetables, &c., for sale, the returns for which seldom exceeded 1*s.* or 2*s.*, and not unfrequently only extended to the paltry sum of 9*d.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

Hothouse.—The uncertain state of the weather will entail an unusual degree of assiduity on the part of the cultivator, as the application of a large supply of artificial heat at one time, and the absence of it at another, are alike dangerous to all plants under glass, but particularly so to those requiring only a temperate climate. It will therefore be absolutely necessary to employ a more than ordinary amount of diligence and forethought to ward off the destruction which will assuredly follow the least negligence. The young gardener should set himself studying the atmospheric changes, being guided in a great measure by the instruments usually employed for that purpose. Nothing relating to his profession can be of much more use to him than an intimate acquaintance with these phenomena which affect so seriously his pursuits. A gardener, in fact, is always at the mercy of the weather. A chief part of his occupation is to apply heat and water to counteract the drying and freezing effects of summer and winter. To understand how to apply these without injury to vegetation is a matter of great importance to all plant growers, more especially to the inexperienced in such matters; they cannot therefore do better than begin the year by making themselves thoroughly acquainted with the subject.—*A.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Discontinue the digging of borders for a short time until the soil gets into a sufficiently dry state. Lay turf if not already done. Dig gravel, &c., for spring use. Rhododendrons in woods would be much benefited by having a small quantity of leaves placed over their roots to keep the ground moist during the summer months; also gather the seed as soon as the capsules begin to burst. In wet weather prepare labels, sticks, crocks, &c., for spring and summer use. Clean seeds, &c. See that recently-planted shrubs and trees are not loosened by wind and rain. Sweep and roll walks, lawns, &c. Protect bulbs if the weather changes to frost. Nail and tie up climbers on walls, trellises, &c., and protect the roots of any that are not perfectly hardy. *Pits and Frames.*—Plants suffering from drip must be removed to a better situation, in order to prevent their roots from perishing. Cold pits and frames ought to be defended by linings of Fern or leaves to repel the frost. Give air freely when the weather is not frosty. Avoid watering at this season, and remove all damp leaves, &c., the moment they appear.—*B.*

III.—FLORISTS' FLOWERS.

Trusting that former injunctions have been duly observed, the amateur's collection ought to be in first-rate condition, especially as the weather has hitherto been so open and propitious. It is possible that seedling Tulips and offsets, which were planted early, are now beginning to show themselves above ground; in this case, care must be taken to cover them as they appear. I usually put small cones of white pit sand over the advancing plants; by which means they are saved from frost, and canker is prevented. In severe or rainy weather, mats or other covering should be put over the best bed. Auriculas and Polyanthuses in frames ought not to be closed up in a wet state, the former in particular being extremely impatient of damp. Take great care that the drainage is effective, and remove all dead or decaying leaves as they become yellow. After frost examine all plants, as Carnations, Pinks, Pansies, &c., on beds; fasten them as required; small Fir branches, 6 or 9 inches in length, stuck round and amongst the plants, will have a very beneficial sheltering effect. Collect leaves, turn soil heaps, cast leaden labels and layering pegs, prepare crocks for drainage, mend and make shades for Carnations, and see that everything is put away ready for use.—*C.*

IV.—PINERIES, VINERIES, &c.

Do not suffer the linings of dung pits containing young Pines to decline; keep, if possible, a temperature of 50° at night and 60° by day, with air less or more at all possible opportunities. Late swelling fruit should be sedulously attended to, supplying much atmospheric moisture to counteract the parching tendency of pipes or flues, and suffering the plants to become dry in the leaf once in 24 hours. Keep up strong fires on light days, so as to be enabled to give front air; if sunny, allow the thermometer to rise up to 85°, lowering it to 55° or 60° on dark days and on the approach of evening. *Strawberries.*—As soon as these put up their blossom stems, encourage them to lengthen by all possible means; to this end do not hurry them; it will probably end only in abortion. Liquid manure is of great service; a mixture of soot water and guano as clear as fine ale will be found to benefit them exceedingly, using plenty of the soot. *Vineries.*—Proceed cautiously with your Peach forcing and Vines; as soon as the latter "break," the temperature by day should be allowed to advance to 65°.—*D.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Proceed with pruning and nailing as previously directed. Whilst the ground is not frozen trench as near the roots of fruit-trees as can possibly be done without injuring them, and work in fresh compost with a fork. In bad weather prepare nails and shreds. Nails should be heated, but not to redness, and then plunged in Linseed-oil. Frequently examine Apples and Pears, and remove all that exhibit the least symptoms of decay. Place a number of fragments of unslaked lime in small flower-pots or boxes throughout the fruit-room, in order to render the air dry and sweet. Lime will continue to abstract moisture from the surrounding air till completely slacked, and before this becomes the case, a bushel will absorb an amount of moisture equal to 5 gallons of water. *Kitchen Garden.*—The seed-room should be kept cool, yet perfectly free from damp, which should be effected without the admission of a current of air. This can be done by the means above recommended for the fruit-room. It is a good plan to procure more seeds than will actually be required for the sowings of one season; for although seedsmen ought to be answerable for the quality of their seeds as far as their vegetation is concerned, yet they may be deceived with regard to some of the varieties coming true to their kinds; and therefore if you have had seeds of Cauliflower, Walcheren Broccoli, &c., which have come true this season, take care of any seed that may have been left. Plants from such can be depended on, whilst those from the new seeds may prove a degenerate race.—*E.*

State of the Weather near London, for the week ending Dec. 26, 1846, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents,

Books—*Dublin, College Green*—"Hoare on the Vine" for Vines on walls, "Roberts on the Vine" for forcing.——*F.*—Lindley's "Theory of Horticulture."——*A Constant Reader*—We fear that your object is one which no periodical will supply. You had better try the "Botanical Register."

Cacti—*E R*—Most certainly your question never reached us, or it would have been duly answered.

Cucumber Pits—*John Kelly*—If you are a good gardener you may grow Cucumbers and Melons in flued houses, and of course you may get them forward enough there to ridge out. Plant your Bangers over the dung; the course you have taken is very proper. We do not comprehend your question about "getting off the present beds." If you mean that your Potatoes are sprouting, why you had better plant them at once, and ridge them up enough to prevent the shoots getting frost bitten; you can easily rake the ridges down again in the spring.

Heating—*Clio*—Indeed we cannot recommend tradesmen; you will find full information in our advertisements, or by application to the advertisers. By no means use the gun-barrel pipes, but good 3 or 4 inch pipes; and add a small tank for hot-water vapour if you can afford it. Fellows of the Horticultural Society are supplied with such plants as are in distribution without charge. Many such lists as you request will be found in previous Numbers, among the Notices to Correspondents; especially consult pp. 72 and 460. However, by next week we will have a new list prepared for the new year. We never take fees.——*W P K*—Having a quantity of 4-inch pipes, you can very well employ them for heating your pit. All you have to do is to place them in a chamber, communicating with cavities at front and back. Slate is the best material for supporting the soil, but whether slate or wood be the material employed, it should be laid perfectly close and level. Sufficient top-heat will ascend by the cavities.——*A Subscriber*—You will find ample information respecting tank-heating in previous Numbers of this Journal. Hot water is by far the best material for obtaining bottom-heat. If you can make the flow-pipe rise a little into the tank, and the return-pipe fall, so much the better. For such a tank as you speak of, a small-sized boiler will do. We cannot recommend tradesmen. Consult our correspondence.

Insects—*πσλ*—The slightest touch of naphtha, applied with a brush, will kill the American blight on Apple-trees. Coal-tar naphtha answers the purpose as well as any other kind, and is the cheapest. With regard to the brown scale on Vines, the surest plan is to displace them by mechanical means, and then wash with a brush and soap-suds.

Melon-pits—*Banks of Doveron*—Pigeon-holes in wood work will answer for the admission of heat from dung linings as well as if they were formed in brick-work; but wood in such a situation cannot last long. If well-worked dung be employed, sufficient heat will be generated in trenches 2½ feet wide; but the walls should be pigeon-holed nearly to the bottom of the trench.

Names of Plants—*Sub*—Tropæolum azureum.——*C B*, Cheam——The Lucombe Oak.——*Harraby*—Teucrium fruticans.——*A B D*—Dendrobium aureum.——*B C*—We must beg to direct your attention to our having repeatedly stated that if plants are to be named, examinable specimens must be sent, and that we cannot waste time in finding out the names of leaves without flowers. No. 1 *may* be a morsel of some Daviesia; No. 3 may be Sempervivum arboreum. Periploca græca is a hardy twining shrub; you have only to plant it in light, well-drained soil, and it will take care of itself.

Potato Fungus—*Ely*—We will attend to your suggestion in our next, if possible.

Primula sinensis—*J W*—Among your seedlings, the bright rosy crimson variety is the highest coloured one we have seen, the other specimens are not uncommon.

Pruning—*Stockton*—Next week.

Sea-kale—*An Amateur*—The rotting of your plants is more likely to have been occasioned by over-heating with rank dung in forcing, than by the state of the soil. Mix the heating materials with leaves. Trench and prepare the ground for a new plantation as you propose. You may safely use 12lbs. of salt to a rod, cropped with this vegetable.

Sea-water—*J W*—We do not anticipate any serious mischief to your garden from its having been overflowed by the sea. If the crops are washed away dig the ground and replant with Cabbages, which like a little salt. Your Pelargoniums must be treated with more care. Knock the soil off them, wash them in fresh water, and repot in fresh soil, cutting back the unripe wood which is beginning to change colour.

Training—*Charing*—In training branches spirally upwards from two main horizontals which your headed-down old Colmar tree has formed, you need only shorten the former a little, merely depriving them of the imperfectly-matured extremities.

Vine-borders—*Tyro*—The component parts of concrete are—1 proportion of powdered quicklime, 2 of coarse sand and small pebbles, worked up with water to the consistence of thin mortar. 40 bushels of lime will be proportionate for a border 50 feet by 12. The mixture should be worked till the lime is completely slaked, and immediately spread evenly where it is intended to set.——*Corresp. Norfolk*—You may apply 30lbs. of guano to a Vine-border 60 feet by 15; but it will ensure safety if you first mix the guano with rich fresh loam, and fork in the compost a few weeks hence, taking care that the guano is exposed to the air as little as possible.——*J A P*—Under your peculiar circumstances of being compelled to build a floor upon your Vine-border, we would advise you to proceed thus. 1. See that it is thoroughly drained. 2. Lay sleepers of brick or wood or stone across it, and on those sleepers lay your flooring. In that way you will prevent the latter resting upon your Vine-border. Then contrive ventilating holes in the side of the wall which carries your floor, so that air may get at it. Leave also traps here and there in the floor itself, which may be opened for the purpose of giving your Vine *warm* water in the spring, when it is making its growth.

Ward's Case—*Muscus*—He who wishes to grow Mosses in this contrivance need only put them with some damp peat into a bottle and cork it up. Nature does the rest. A bell-glass with its edge resting in sand is as good as anything, provided the sand is kept moist. You would do well to read Mr. Ward's little book published by Van Voorst. We never recommend tradesmen. It is their business to bring their wares into notice by advertisements. We cannot undertake the settling of exchanges.

Misc—*C C*—Fellows of the Linnean Society are allowed to borrow books; we believe an A.L.S. pays 1*l.* 1*s.* a year. You should apply to the Secretary.——*M W K*—If your plants are rightly named there are some very good things among them: and they are not at all dear. The Veronica speciosa is dog cheap.——*Norfolk Corresp*—You may apply guano to Asparagus beds at the rate of 15lbs. to a rod, with abundance of water.——*Woglog*—You will find instructions have been given in the Calendar of Operations.——*R W*—In pruning Apricots and Plums trained against a wall, the wood of this year's growth should be a little shortened, in addition to thinning out where it is too thick.——*J A T*—Royal Muscadine and Black St. Peter's.——*A S*—Royal George and Grosse Mignonne.——*Banks of Doveron*—Your Apple-trees intended for espaliers should be grafted on English Paradise Stocks; your Pears on Pear stocks, for your subsoil being rotten slaty rock, would be too dry for the Quince stock.——*Horsham*—You had better apply to the Secretary of the Agricultural Society, Hanover-square. Camellias will bear the same heat as Pelargoniums. A greenhouse for forcing the latter may be kept between 50° and 60°.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of these numerous correspondents, the insertion of whose interesting contributions is still delayed.

FARM TO LET, Seven Miles to the South of London. 134 acres: about 60 Grass and 70 Arable. Soil, rather heavy. Address, S., *Gardeners' Chronicle* Office.

The Agricultural Gazette.

SATURDAY, DECEMBER 27, 1845.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Jan. 1—Agricultural Imp. Soc. of Ireland.
FARMERS' CLUBS.

Jan. 3—Melrose		Jan. 6 { Wivelscombe / Abergavenny	
— 5 { Darlington / Uik		— 7—Monmouth	

WITHIN the past week we have received a great many reports of AGRICULTURAL SOCIETIES from their secretaries, accompanied generally by short histories of their progress, and statements of their present prospects. From information thus acquired, we are bound to conclude that Farmers' Discussional Clubs are, unfortunately, for the most part, short-lived Societies. They spring up under the fostering care of two or three intelligent members, increase for a year or two in the numbers who join them, and in the interest they excite, but, at length declining in both of these respects, after struggling through a few seasons, they die. Among the communications in answer to our appeal on this subject, many contained professions of willingness to satisfy our inquiries; but, says one, "I am sorry to say it is long since I made the last effort to assemble our members;" and another, "Our Farming Society has not been in existence for the last two years; it died from the want of that sustenance which the resident gentry shamefully neglected to give it;" and a third, "Our Club has ceased to exist for 3 or 4 years; it met with a violent death through the folly of two or three of its members, who objected to your humble servant continuing the office of secretary, because of his political principles;"—in fact, the answers received to many of our inquiries have just been a series of epitaphs, each recording the period during which a Society existed, and the date and cause of its death. Now, in order to determine the proper method of treating a disease, it is important that the symptoms which it exhibits should be fully understood; and it may, therefore, be as well here to mention that, among the many deaths detailed to us, very few, indeed, have been abrupt and violent; they have more generally been of a lingering character, such, indeed, as that hinted at above, which would result from a sufficiently long period of semi-starvation. The following letter, received from the secretary of what, as it is now in its third year, must, we fear already be considered a middle-aged Society, exhibits very fairly the condition of the majority of existing Farmers' Clubs, so far as we are able to judge from the reports which have been received:—

"If you can give me any advice as to the best means of reviving our Club, I should be very glad. When we began, we had good meetings, but they gradually fell off. There is hardly a person in the Club, except myself, and, perhaps, two or three others, who would, for a moment, entertain the idea of committing their thoughts on any subject to paper. If a scientific subject is brought forward at one meeting, it is, I fancy, a pretty sure antidote to attendance at the next on the part of many. I have, therefore, endeavoured to raise conversational discussions on points of practice. A great deal of information is struck out in this way, but no man thinks of waiting to deliver his sentiments till others have done speaking, and the result is a pretty considerable hubbub. The conversational mode of discussion is the only way to be pursued, because most of our farmers have no notion of getting up and making a speech. Conversation begun, it is soon carried on in groups, and it would take a cleverer secretary than myself to furnish a report of the meeting. I can hardly blame the farmers for non-attendance now, because I feel that, from the reasons above given, our meetings have been, to a considerable extent, unprofitable. We have an anniversary meeting in June, at which we obtain a lecturer, and an annual ploughing match in October. On each of these occasions we have a dinner, and *this* is well attended, and at *these* the members of the Club are tolerably enthusiastic in its support. If the members of the Club would really co-operate with the few who do exert themselves to sustain it, I feel strongly that the ——— Farmers' Club is most favourably situated for success. We meet in a market town in the centre of a very fertile agricultural district, presenting great field for improvement, and the farmers, prejudiced though they may be in a great degree, are, for the most part, very sound and intelligent practical men. Your list of subjects [see p. 842] for discussion is calculated to be of great service, and if we do elicit anything which I think suitable for your pages, you shall receive it."

It only needs, in order that our readers may be able to judge of the general history and present condition of these Discussional Societies, that we give an extract from one more of the reports which have been sent us, which may be taken to represent the character of a very few out of some hundreds. The writer says:—

"I have great pleasure in stating to you that we have had an accession of members this year, several of whom have been living in the immediate neighbourhood, and when asked to join us, used to reply, 'Oh, I don't see of what use it is; I already know how to farm as well as any of you can tell me,' but I believe such notions are fast giving way; it always appeared strange to me that farmers should not be members of a Club, when there is an opportunity of gaining information, and, also, I am confident, profit, when, on the other hand, they have no chance whatever of loss."

The fact is, Farmers' Clubs, in their present condition, are a failing population, whose members rarely attain more than 6 or 8 years of age. The majority are drooping towards death, many have already ceased to exist; some, it is true, are rising up here and there to fill the void which has been left, but a few only of them all exhibit full vigour and activity. It is certainly much to be desired that this last case were more general, for no Societies, we are persuaded, are so useful in the cause of agricultural improvement as those which, like these, tend to that kind of self-instruction which a body acquires by the intercourse of its members.

Farmers' Clubs are of two kinds: first, those existing in well cultivated districts, where the occupiers of land are an intelligent class of men, who know the importance of inter-communication on agricultural topics, and the advantage of an acquaintance with the theory of their art, and who, therefore, unite together to discuss points of farm practice, or to hear hired lecturers illustrate the teachings of agricultural chemistry or geology; and, secondly, those existing in the ill-cultivated parts of the country, amongst a comparatively uneducated tenantry, which have been established, it may be, by some of the neighbouring landowners, and are to be kept alive only by the constant exertions of their office-bearers. It is amongst Clubs of the latter description that mortality prevails; the former have all the elements of permanence and vitality *within* them, and, though liable in rare cases to an abrupt and violent death, this, like similar cases amongst ourselves, is generally the consequence of an excess, as it were, of the vital principle; or, to drop the simile, it is owing to an excess of interest in the subjects they discuss; the latter class of Clubs, on the other hand, have to be maintained by a force from *without*, by nourishment to be supplied, and we cannot help thinking that the lingering sort of dissolution which sometimes attacks them is generally caused by that semi-starvation, the effects of which it so resembles. Perhaps the majority of Farmers' Clubs belong to this second class, and it is well that where any have established a Society of this description, they should fully understand that it will not do to leave it to itself; the attendance of its members must be kept up solely by *their* exertions; any relaxation of effort on their part before the members have been educated, as it were, into a spontaneous interest in the matters they discuss, is subjecting the Society to a course of starvation which will surely end in death.

The interest of its members in the continuance and activity of a Farmers' Club is, of course, to be kept alive simply by such a selection of subjects so treated, as it shall evidently be for their interest, as farmers, to consider and discuss. And we have only to add that we are happy to place all the means of assistance we can command at the free disposal of the office-bearers of such Societies as these. There are none, we are persuaded, of greater usefulness to the agricultural interest, and no men have a more influential connection with the progress of agricultural improvement than their secretaries; and we shall feel highly honoured, if permitted, so far as our means extend, to assist these gentlemen in the performance of their arduous duties.

ON THICK AND THIN SOWING.

(*Continued from page 863.*)

SINCE writing the foregoing, such a mass of recent facts have come to my knowledge, all in favour of thin sowing, that I am perfectly convinced it must answer as a principle on an average of seasons, with proper management, and a regard to circumstance of game, weeds, &c. I have reason to believe that the frequent disturbance of the soil in the various stages of the growth of the plant, is a great protection against insects, by exposing or destroying their larva prematurely. I do hope prejudice will not prevent every farmer from satisfying himself, by trying an acre or part of one, in each field, with a small quantity of seed, and do this for several successive years.

It is quite possible that when once the principle of thin sowing is well established, that transplanting corn, one plant on every square foot, will be extensively adopted. It can be done very cheaply, say about 12*s.* per acre or less, and it (as is shown at page 42 of my book) we can thus secure a greater crop and economise seed, it would be doubly advantageous, by allowing us to feed off our roots for Wheat on light land, or to expose our heavy land to the pulverising and chemical action of frost. It appears to be agreed on all sides that if there is a sufficient plant in March, or the early part of April, we have nothing to fear from thin sowing in common seasons. Now even admitting that a particularly adverse winter, like the last, should kill a portion of the thin-sown Wheat plants, I see no reason why we should not transplant the vacant places from a rich seed-bed, late in March, or early in April; I have reason to know that such plants will come in good time, in ordinary seasons, with the rest of the crop. At all events, let us try and convince ourselves in all these points, by experiments on a small scale.

One of the chief benefits derived from using Newberry's dibbling-machine is the consolidation of the soil, by its great weight, thus closing up the burrows and retreats of the insect tribe, crushing and starving them. It should never be used when the land is in a pasty state. Where the drill is used on light lands, it ought to be followed by Cromkill's clod-roller, to obtain a similar result.

The remarks made by various farmers, who have inspected my farm, convince me that thin sowing will never become a favourite by its appearance, but by calculation. Thin sowing in its early growth never looks like a crop till it is measured in the bushel. The length and breadth of ear, and size of kernel, are slightingly passed over, whilst fear points to the uncovered intervals. The abuse bestowed on Mr. Hewitt Davis is characteristic of obstinate and prejudiced attachment to old customs. How frequently am I told, "Oh! but Mr. Davis is, I hear, not a good farmer." My answer is, "Look at his stacks and his stock. The man who produces 14 stacks on the same land that only used to produce 4, and keeps three times as much stock, cannot be a bad or middling farmer." But, then, thin sowers will always be pitied and abused, because the crops look thin on the ground, and because two halfpence always look bigger than a penny. No doubt I shall be equally contemned, but my stacks and my stock will be my justification with men who calculate; with those who do not, it is useless to reason.

A neighbour of mine, at Stamford hill, has this season dibbled one Wheat kernel in every square foot. Each kernel has produced, on an average, 15 perfect ears. I have closely inspected them myself, and consider they would produce an increase of 9 qrs. per acre, had that quantity of land been sown; and yet most farmers would call this a thin-looking crop. They bow down to the tremendous thunder showers we have recently had, but boldly raise their heads again; they were sown in October. My neighbour is of opinion with me, that, with early sowing, they would have tillered still more; but, most probably, the more numerous the heads the smaller would have been the ears and kernels, so that nothing would be thus gained—except time, a most important object. They are giants in appearance, compared with the ordinary puny ears and stems of those sown in an adjoining seed-bed at the same time, and on the same quality of soil. This is an important fact; because it proves that thick sowing absolutely diminishes the produce in an extraordinary degree, whilst the reverse takes place by thin sowing. The height of the thin sown was 5 feet, that of the thick about 18 inches less. The ears of the thin sown 6 inches long, the flag-leaf fully 1 inch broad, the rows of kernels were about 12 to 13 on each side, and it is calculated that each would average at least 100 kernels. Thus, as every kernel dibbled vegetated, there would be an increase of 1500 for 1. The appearance of this crop justifies my opinion, that, although sown in good soil, it would have been more forward, and the ears more uniformly developed, had it received, during two or three periods of its growth, top-dressings of manure, such as soot or guano, mixed with fine bone-dust, gypsum, and nitrate of soda. I also conclude that, had this Wheat been sown in July, in a seed-bed, and transplanted in October, one plant in each square foot, it would have been a fortnight earlier. A friend of mine produced ears 8 inches long, by transplanting in October. Transplanting deeply, say from 4 to 5 inches, a foot every way, either in October or April, will produce a crop; but I should much prefer September or October, because it would forward harvest. I have seen some transplanted last April, one plant in every square foot, which quite surpasses that in the seed-bed from which it was taken, although sown in October.

In my opinion the safest and cheapest way to secure an early and abundant crop, is to sow in a rich seed-bed in July, and transplant in September or October, or as early as your operation will permit, giving ample space and abundant food. I hope we shall as a system consider it good policy to forward the growth and increase the quantity of our Wheat-crops by top-dressings, and so leave our land ready for another crop. To do this with thick sowing would be ruination. Let us then try it with thin dibbling or transplanting. We must not forget that one kernel on every square foot is only two quarts per acre, and that those who sow three bushels per acre put 48 kernels on every square foot, and only get a return of 13 for one when they reap five quarters per acre. Let us bear in mind it is the ample supply of manure and not the large quantity of seed that ensures an abundant return and improved staple of

soil. Many farmers in a particular description of soil are fearful of growing Wheat, because from its rankness it gets ruinously laid. Thin dibbling and abundant rolling would remedy this. The maximum of size and number combined is the point we want to ascertain; much depends on the quality of the soil and character of the season; but still more on the supply of food we administer to the plant. I have no doubt in my own mind, that by occasional top-dressings in a showery season, as much as 13 quarters per acre could be grown by thin sowing, perhaps more. Of course this opinion will be ridiculed by those who do not calculate. Let such folks bear in mind that 240 kernels for one, supposing we sow two pecks per acre, would be 15 quarters per acre. But then we must apply to the soil a sufficiency of food to mature such a a crop.

To attempt to grow 15 quarters per acre with only food enough for 5 quarters, would be as absurd as trying to keep three horses in condition with only one horse's allowance. You can never ripen a large quantity of large ears unless you give a proportionate quantity of manure to mature them. Starvation to either man, beast, or plants, will reduce them to mere skeletons; abundance of suitable food, with cleanliness and warmth, will make them comparative giants. The concentration of manure and its consequences are plainly exemplified at our flower-shows, where enormous masses of flowers and foliage are produced by one solid foot of prepared earth. In a state of nature forty times the quantity of soil would fail to produce similar results. No doubt the frequent application of moisture when requisite assists in producing this effect; but a knowledge of this fact should stimulate us to study irrigation, and apply our liquid manure to the roots when the plant is in vigorous growth, instead of wasting it in our horse-ponds. I know and can appreciate practically the effects of such applications.

I hope we shall hereafter deem it good policy (at least I shall do so), to expend 3*l*. to 5*l*. per acre in top-dressings upon our Wheat crops at various periods of their growth. If by doing this we can increase our quantity by three quarters per acre, which I am sure we can, it is not only a present profit but a future gain, because as we increase the surface-growth, the subterranean growth is equally encouraged, filling the earth with vegetable food for a subsequent crop, and leaving the land in condition to support immediately another crop, with the unconsumed portion of our top-dressings. We must never forget that roots are most sensible fellows, they will never go away from a meal that contains all the necessary component parts for the formation of their superstructure, provided they have in addition a sufficiency of air and moisture. A Vine-root will enjoy a bone for many years, and never leave it till its goodness is completely exhausted; but then a bone is porous and attracts and retains moisture and air, as well as containing all other requisites. Let us apply this knowledge by mixing bone-dust, burnt-earth, and gypsum with our guano and other stimulating manures. Let us never forget that by wide and thin sowing our land can be kept like a garden, in readiness to receive another crop. The principal advantages of thin sowing, are, in my opinion, the effects of frequent tillage on the subsequent crops of the course, and the consequent continual amelioration of the soil—matters of importance to both tenant and landlord.—*I. J. Mechi*, 4, *Leadenhall-street*, *July* 1845.

P.S.—It is a curious fact that no farmer would allow Cabbages or roots to cover the ground in their early growth; and yet he denies to his Wheat-plants that room for expansion which he considers so necessary to the Cabbages. As to a provision for the wire-worm, that is quite unnecessary now, because it is a well-established fact that Croskill's clod-crusher roller is an effectual remedy or preventive; although I believe there are plenty of farmers who will not believe it, or decline using it, preferring the loss of their Wheats—a heavy penalty for prejudice or obstinacy.

The following remarks received by me in two letters from an experienced farming friend, are so just and appropriate that I annex them in the hope that they may assist in removing prejudice:—"Some 40 years since a relative of mine, who farmed most extensively and scientifically, drilled never more than one Winchester bushel per acre, and he continued to do so for many years, and until the day of his death; but few or none followed his example: men were too ignorant to emerge from their ancient prejudices of sowing much in order to reap much; but whoever lives to see it, the time is near when no more seed than four pecks, if so much, will become general; indeed, it is absurd to put in more seed than that quantity. Last year there were some wonderful yields of Wheat, but as far as I have been able to ascertain from inquiries, wherever the plant was the thinnest—there the yield was the largest. In my parish, nearly seven quarters or quite, was produced from less than six pecks of seed; and one farmer in the neighbourhood told me and my friend, that he had an unusually thin plant on one field; so much so, that he was near ploughing it up; but he let it stand, and on that field, 16 acres—he had 16 coombs to the acre; and I never heard of a large crop from a thick plant. I rejoice, therefore, that you are trying thin seeding; depend upon it you will succeed in the end. You know I am, from many years experience, thoroughly convinced of the reasonableness and of the advantages of thin seeding; indeed, I consider it is just as absurd as put 20 Acorns into a hole to produce an Oak tree, or 10 Windsor Beans to produce one Bean-stalk, as to put 20 grains of Wheat, or Barley, or Oats, as is often done, into a hole, in order to produce one shoot or plant; indeed, did we not see it done, did we not see two, three, or three and a half bushels of Wheat upon one acre of land for seed, we should not believe that men in their common senses would do it. But so it is, and it is done everywhere nearly, and almost by everybody, though no man can give a rational reason why it is done; but if you ask a farmer why, he replies, 'because I always have sown so much, and so did my father, and so did my grandfather, and uncle Toby, and all our family.' Aye, say I, and they either walked to London, if they ever went thither, or rode on horseback, and probably made their wills before they set out, and took their leave of their families, and were always three days on the road, that is from these parts. But now people go the same journey in three hours, and so do you; but if you were to follow all the practices of your forefathers, you would go to town now as they did then, and in fact do everything which they did, and as they did, and alter in nothing. But so it is, they sow bountifully, that they may reap bountifully, as they think, and as they will continue to think, until education will push them out of their seats, and place other men with more enlightened views in their places."

June 25.—A gentleman in Suffolk writes to me thus, under yesterday's date:—"I have a piece of Wheat sown at 10 inches distant, 1 bushel to the acre, drilled, which I heard pronounced by a stranger to be the best looking field he had witnessed between Cambridge and Sudbury. My drilled Wheat at 3 pecks per acre was rather later than it ought to have been; but, I believe, from present appearances, it may be estimated at above the average. I have no hesitation in saying, that the thin sown Barley, at 7 pecks*, 10 inches apart, is the best crop in this neighbourhood."

"*Suffolk, July 18th*, 1845. Dear Sir,—Your letter followed me here from Herts, but I regret that I should not in any case have had a moment for a call in Leadenhall-street on my way to Surrey, where I passed two very interesting days, one of which was entirely devoted to the inspection of Mr. Davis's farms, which he was kind enough to accompany us over in person, explaining his whole course of cropping, working the land, and finally (but I agree with you, indisputably, and inseparably connected with the other two, deep drainage and deep and frequent tillage) his plan of thin sowing. My nephew has carried out the latter in Herts most successfully, though experimentally, as any prudent man would. In the same field I saw portions of 5 pecks and two bushels of Barley, and the decided superiority of the former was very apparent. What was very remarkable, also, was that the thin sown grain appears to be of slower growth and development than the other, as I was assured that three weeks ago it was as much below the other in length of Straw and vigour of growth as it stands now above it. The same remark may apply to his Wheat lands, where the breadths of 4 and 3 pecks are very superior to those sown with 2 bushels and 2½ bushels.

"But the most decided and satisfactory proof to my own mind is to be met with on my own little farm, which I have been walking over this evening after a fortnight's absence. I think I told you that I had some doubts about a piece of Wheat, dibbled at 3 pecks to the acre, on account of the lateness of the period at which it was sown. This apparent failure, however, I now see was the slow development of the plant under the extraordinary vigour which it was assuming; for the extraordinary size and number of the ears, and length and strength of the straw, have really surprised me; and they are evidently still growing. I am but a young calculator of such matters, but I cannot estimate the produce at less than six quarters per acre; and next month, as the crop stands well for inspection, I shall certainly have it viewed by some experienced hand; and if the harvest and housing is favourable, shall test the yield by accurate measurement. The same remark applies to my Barley, for I find finer ears and stronger straw on land after a very foul unmanured Pea crop, sown with six and seven pecks, than on that coming after the clean tilth of a Turnip crop, with the ordinary quantity of 2 bushels and 10 pecks. In short, my maximum next year will be 3 pecks of Wheat and 5 pecks of Barley, at 1 foot of the one and 10 inches the other. But I concur with you in thinking that the horse-hoe is desirable if not indispensable. My only question now is, what is the maximum of distance between the rows, and if it admits of the safe use of the horse-hoe. I shall always be happy in receiving any suggestions you may be good enough to make. I remain, very faithfully yours.

"As an instance how difficult it is to arrive at an opinion on a subject of this sort, and how apt some people are to run away with a prejudice, a gentleman holding land in the south of Essex assured me, only last week, that his crops under the adopted system of thin sowing had proved a complete failure, and that several small farmers in his neighbourhood would be completely ruined by it. But when I asked him if his land had previously been well drained and deep ploughed, as well as thoroughly well hoed, he was unable to answer me satisfactorily on these points, and I could therefore only beg him not to be so hasty in arriving at his conclusions. From the same authority I learned, that Davis had ploughed up his Wheat crops under an utter failure! So I went to judge for myself."

* This is three to four pecks too much seed. Mine, at a bushel per acre, will be a full average crop.—*I. J. M.*

ON THE PRODUCTIVENESS AND VITALITY OF POTATO SETS.

I send you two papers of mine which have appeared in the "Irish Farmers' Journal." They are perhaps too much Irish to be of any use in England; yet you may find something in them to serve the holders of allotments. You will find I allude in them to some curious facts, by which it appears that plants are productive rather from the space they obtain over-ground than below it, and that on rich ground, which we might suppose better able to sustain a close crop, if its nourishment proceeds from the root, grain sown at very wide distances gives an acreage return equal to that sown at much narrower intervals; is it that the ammonia, light, and electricity of the air, is not in sufficient quantity for plants at these intervals? The strength and length of the straw would indicate a greater action of light on the carbonic acid. Do plants, instead of absorbing by their roots their particular food, throw off by their leaves the peculiar matters they do not assimilate, and thus plants of different assimilating powers thrive together? and where they do not exist together, may not the soil absorb them, and in part retain?—*J. M. Goodiff, Granard.*

The following are the papers alluded to by Mr. G.

On the Productiveness of Potato Sets.

There is, perhaps, nothing more worthy of inquiry than the differences which exist in the productiveness of plants, under the same treatment, in the same soil, and in close contiguity with each other, and without any discernible cause for these differences; and, with a view rather to draw attention to the subject than to the conclusiveness of its results, I beg leave to detail an experiment made with Potatoes. It occurred to me that the very great variations in the productiveness of Potato plants of the same kind of Potato, and in the same drills and ridges, and in immediate proximity to each other, were not likely to arise from any peculiar property of the contiguous soil, or any gaseous influence in the air, but rather from either the manner of cutting the sets, their more or less exhausted state from previous growths, or from some internal construction indicated by the form of the Potato, or the eye, from which the shoot proceeds. I submit this experiment with some hesitation, as from a mistake in over-manuring the ground it is not so decisive as it might otherwise have been. I had it manured on the surface after the Potatoes came up, not recollecting that it had been previously dunged, and the consequence was that the plants grew with almost equal and very great luxuriance. The rows were 7 yards long, at 2 feet asunder, and planted on the 30th May. This late planting allowed the first growing eyes of the Potato to have made and lost some previous shoots. I say the first growing eyes, for it must have been observed by others as well as myself, that some eyes of the Potato shoot earlier than others, and that some of the late-shooting eyes (those generally nearer the stem of the Potato) do not shoot at all when a whole Potato is planted. I have, by cutting out the eyes of the Potato as they successively grew, not only induced every eye to shoot, but have even got a shoot near the stalk, from where there was no perceptible eye till the shoot came forth. From this property in the Potato, we may see how wasteful it is to plant it whole, as also the cutting it down in two parts, from the rose-buds to the stalk, recommended by some. The first row was of the rose-eyes (three top eyes) scooped out with a tea-spoon in the form and about the size of the top of a man's thumb; the second row was of the bottom or stalk-eye; the third of the stronger eyes that had previously sprouted, and lost their shoots; the fourth of the later and weaker looking eyes that had not sprouted; the fifth the scoops taken downwards so as to take in the protuberance under the eye, and which I think may possibly contain sap-channels of the eye*; the sixth scooped upwards so as to exclude this protuberance; the seventh, those projecting or nipple eyes, which appear to be the result of a later growth, and are generally an aggregation of small eyes; the eighth, scooped downwards as the fifth row; the ninth as the sixth; the tenth as the seventh; the eleventh, deep-eyed Potatoes; the twelfth, shallow-eyed, having a disposition to appear as the sixth; the thirteenth and fourteenth, deep-eyed, with a very deep-eyed red Potato among them: the plants of this red Potato all had the curl, and were unproductive. All the eyes were scooped, the direction of the scoop being towards the stalk in all except those otherwise stated, as either upwards or more decidedly including the protuberance beneath the eye.

No.	Kind of Set.	Produce in lbs.
1	Top, or rose eyes	21
2	Bottom eyes	18½
3	Strong eyes that had sprouted	20½
4	Later eyes, that had not sprouted	15
5	Cut downwards with protuberance	14
6	Cut upwards, without protuberance	14
7	Nipple eyes	7½
8	As No. 5	20
9	As No. 6	14
10	As No. 7	5
11	Deep-eyed sets	11
12	Shallow-eyed sets, disposed to nipple	11½
13	Deep-eyed, mixed with a red Potato	6
14	Do. do.	10

* I use the term "sap-channel," though not quite satisfied with it. I conceive the eye or bud of the Potato is connected with it in the same way as the leaf-bud of a plant is connected with the stem; for the Potato is not properly a root; both the leaf-bud of a tree and the leaf-bud of a Potato send their roots down into the soil; the leaf-bud of the tree at all times mediate the stem of it; the bud of the Potato immediate to the soil after it has shoot forth or developed.

In other experiments I have found no difference in the produce of the top and bottom eyes. I did not expect to have found the early sprouting eyes, so late in the season, producing more than the eyes that had not previously sprouted, and this is contrary to an opinion that has lately gained ground, of the advantage attending planting early in the season, previous to the Potatoes sprouting. The experiment is in favour of cutting the sets downwards, but not very decidedly so, for in 5 and 6 there exists no difference, yet there is a decided one in 8 and 9. The deep eyes do not appear to have an advantage over the shallow ones, even where they appear disposed to nipple; while the decidedly nipple-formed eyes are very unproductive. But the most extraordinary difference is between 13 and 14, in which I am not aware that there was any difference in treatment or seed; they both had equally intermixed sets of a red Potato, that produced none but curled plants, with a few small Potatoes under them. Had it not been so, they would, I think, have produced at least half as many more Potatoes, and number 14 would at least have equalled number 1; and these are so much more productive, from their being the outside rows in the experiment, I feel assured. They are a further confirmation of what I have frequently observed before, that the produce of a crop depends much on its having a free space above the surface of the earth, and not below it. On the one side of this experiment, that of number 1, was a plot of summer Cabbage, manured on the surface; that on number 14 was a plot of Onions, with the manure also spread on the surface. In former times, the plain, practical farmer was much laughed at by those who thought themselves scientific men, for sowing a mixture of Grasses, but it has lately been found in England, by some men who are not too knowing to learn, that a mixture of other crops may be advantageously admitted. This has been generally done with a view of advancing the growth of a late crop in the spaces of an early one; so that, on the removal of the early one, the late one should be so far forward as to cover the ground shortly afterwards, and in this connection Beans and Cabbage, and Beans and Turnips, have been the crops. The Earl of Lovelace, in the "English Agricultural Society's Journal," states that the Beans are dibbled in February, in double lines, inches apart, and with an interval of 3 feet to the next row, and the ground worked between them till the planting of the Cabbage (the thousand headed kind, and which are planted in May and June, that he was first led to this experiment in 1838 from having accidentally read an account of the husbandry of M. de Felienberg, Hofwyl in Switzerland, in which a similar custom is mentioned. The success has been complete, and it has never been omitted for a single year since its introduction at Oakham; and so far from the Bean crop being diminished (in consequence of the greater distance at which the rows are planted to admit the Cabbages between them), it has, on the contrary, been increased from about 35 bushels to 41—the average yield for five years, since the Cabbages were introduced. Again, with the same object, Mr. Hewitt Davis writes to a South Lincolnshire farmer, as communicated in the *Agricultural Gazette*, of June 14, 1845:—"I grew this winter a Russian Bean, which is planted in September, October, and November, and drilled in rows 27 inches apart, and are horse-hoed two or three times; and the Turnips are drilled in rows 27 inches apart, in May, in the centre of the spaces between the Beans. In this way I never fail to produce perfect crops of Turnips; and a month after the Beans are cleared off, the Turnips cover the ground, and are as clean as the best fallow-grown ones. I assure you, I have grown 90 acres of Turnips in a season, and without a fault."

Lord St. John, of Melchbourne, near Kimbolton, made the following communication to the weekly council of the Royal Agricultural Society of England, on Wednesday, the 12th March, 1845:—

"In consequence of the remarks made to the council at their last weekly meeting, on the subject of growing Beans and Cabbages together, I beg to inform you that for the last four years I have grown the double crop of Beans and Swede Turnips on clay land, with the most complete success. The Turnips last season were particularly good; in many instances measuring 26 inches round: the Beans for the season were also a good crop. I am so satisfied of the advantages of this system of cropping, that I intend adopting it again this year, and am now dibbling the Beans in close double rows, leaving a yard at least between these rows for the Turnips—the field 14 acres."

Now, I stated some time ago, in the *Irish Farmers' Journal*, an unexpected result in an experiment, made with other views, of a great return in two rows of Barley, at a wide interval of 3 feet 6 inches, and in a part of another row, where a wide space was afforded it, these two rows giving 3 lbs. 9¼ oz., and 3 lbs. 6½ oz., while none other of the rows, at 21 inches apart, gave more than 2 lbs. 5½ oz., with the exception of the part of another drill mentioned above. These two rows, therefore, though at so wide a distance, would, in an acreage calculation, have produced as much as the closer rows of 21 inches. A crop of grain, then, might be grown in drills, at this distance, as weighty as in any other way, and a crop of Turnips, Parsnips, or other low-growing herbaceous plants, at the same time produced. This is found, also, to be the case with Beans. In the case mentioned in the earlier part of this paper, of my Potato experiment, Potatoes appear to follow the same rule, of increasing productions at increasing distances.

In the probable scarcity of seed in the ensuing season, this may be an object worth attending to; an equal crop of Potatoes may probably be obtained with one-fourth of the usual quantity of seed, and a very fair crop of Parsnips also got—an excellent substitute for Potatoes, should a disease similar to that of this year, which very probably may, visit them in the next. In drills drawn at 16 inches asunder, one row of Potatoes and two of Parsnips should be sown successively; this would give a distance of 4 feet for the Potatoes. In beds made 3 feet wide, with a furrow of 1½ foot, in like manner a row of Potatoes should be planted along the middle of the ridge, and a row of Parsnips near each edge. These operations should take place as early as possible in the spring, not only as the Parsnip is a slow grower, and therefore requires early-planting, but that the Potatoes may be got into the ground before they begin to decay in the spring, which, I fear, is not improbable; for, in the rot which commenced in the neighbourhood of Killybegs, in the county of Donegal, about 14 years ago, and which brought on famine and desolation to many, and for many years ravaged the country, the disease did not show itself till the spring, and it increased with the increasing warmth of the season; and this present disease, although differing in mode and in appearance, bears, as far as my recollection goes, the same perfume, and communicates the same taste to the Potato affected with it. I cannot too strenuously press these remarks on the Irish public, nor can I urge too strongly the absurdity of a nation trusting to one sort of vegetable for its food, and that one that has for these 14 years been a failing one. We have a warning afforded to us this year. If we neglect it, the most dreadful affliction may fall on us and our children. What has been partial this year may be total next. It is a blasphemous neglect of the warnings of the Most High, bearing a false semblance of faith, to say, "God is good," and refuse to listen to his voice, spoken in the pestilence. I know of no crop that can equal the Parsnip as a substitute for the Potato, nor one that the Irish palate can so soon reconcile itself to. I call for exertion; humble as I am, let me not call in vain.

On Procuring Early Potatoes.—It has been recommended to plant Potatoes before the end of January, and my experience tells me it may be safely done; but I think an earlier crop may be insured by promoting the vegetation of the Potatoes in a warm house; and I am told early vegetation is assisted by mixing them with turf-mould. I would scoop out the growing sets in succession as vegetation appeared. Thus, in time, the whole of the eyes would be planted, and a single failure could scarcely ensue. By planting sprouted sets I obtained in Donegal a crop of well-grown Potatoes by the middle of June. Last spring out of 18 large Cup Potatoes weighing 7½ lbs., I took 176 fine scoops, one inch in diameter and one inch deep—they weighed 4¼ lbs., and I had 3¼ lbs. of refuse capable of being used as food. A statute acre, planted in rows 4 feet asunder, the sets being 9 inches apart, would take only 14,520 sets, weighing only 3 cwt. 1 stone, with a refuse of 2 cwt. and 3 stones—altogether 5½ cwt.—but this refuse fit for food. It has also been recommended to plant the sets nearly in contact, but not touching, on a headland, to preserve them till the regular time of planting out. When the rot first appeared in Donegal I secured in a similar way a crop of Potatoes on two acres of ground, where I should in the common way of planting have lost all. I made a hot-bed early in the spring—it could hardly be called a hot-bed, for it scarcely heated—covered it with about two inches of earth, and laid scooped sets (which are more convenient for transplanting than cut ones, as they drop more readily into the holes made by the dibble) within an inch of each other on it, covering them with about three inches of earth, and commenced transplanting them as soon as they generally appeared above ground; they appeared though when three or four inches high to sustain no check, even when planted out in hot dry weather, so that they were kept covered from the sun when taken up until they were planted. I planted them as deep as I could, even to the covering them when they were not much above the ground in the bed. Although the sets were in many cases completely rotten, so much so indeed as to fall off when removing from the bed, yet there was no failure among them; but of a quarter of an acre that I planted in the common way, not one set succeeded. The early growth in the bed is, I think, accelerated by laying a little loose straw on the top of it.

Home Correspondence.

Flax Improvement Society of Great Britain.—As I am here in Leeds, where there are 27 very extensive firms engaged in Flax spinning, with samples of Flax grown by my instructions in several districts in this country, and also some I have grown to great perfection in my own garden, within two and a half miles of the Bank of England, all of which has been approved by the spinners, I shall quote an additional proof of what can be done by attention in cultivating Flax in a proper manner. I have been handed a sample of Irish Flax grown by Mr. J. M'Castin, Warringstown, county Down, which I have sent to the Royal Agricultural Society; it was bought by Mr. John Morfitt, Flax-spinner, Leeds, 40 stones, at 22*s.* per stone of 14 lbs.: the quality is so superior that I should have no difficulty to sell 40 tons at the same price. Now, as the Belfast Flax Improvement Society reckon 45 stones per acre as an average crop, although I know 60 has been produced, when fine quality such as this comes to market, can the growers of Turnips, Wheat, Barley, Oats, or any other crop, or those that gain prizes for fat oxen, pretend to say, that there is any comparative chance of bringing to excellence and actual profit those articles, equal to that of Flax. I say no; and challenge comparison. The industrious small farmer can do no more than make out a decent living by the general method of grain cropping, whilst the careless or indolent often ends his days in the workhouse; however, I prove by experiments that there is (in the cultivation of Flax) a treble reward reaped by the industrious continental farmers, who are at this moment drawing from our spinners for their Flax 150*l.* to 180*l.* per ton, and even at this high price spinners complain they cannot get a supply equal to the demand. I rejoice in being able to announce a cure for this evil, and to inform the landowners of this kingdom that the very extensive houses of Messrs. Marshall and Co., and Messrs. Hives and Atkinson, and all the other firms engaged in Flax spinning that I have called on, have promised me to contribute towards a society for the purpose of sending out practical men to teach the farmers in cultivating this very important article; if such a society be established and directed by landowners, in the same way as the society in Belfast, which has been so successful in its teaching; and as the cry for cheap food gathers strength and increases, I cannot but imagine that the day is not far distant when the farmers will be glad to turn their attention to the production of other articles than corn. Therefore I beg to say, in conclusion—landowners give your influence and a little of your time to promote such a society (as it will benefit your tenants and yourselves), when you can be backed and have the offered assistance from a wealthy body of merchants, who have, it is well known, their hundreds of thousands sunk in machinery, and must have Flax to keep it going: they are all well pleased with the quality of British Flax, and will be glad to pay the money they transmit to foreigners to British farmers.—*J. H. Dickson, Bull and Mouth Hotel, Leeds, Dec.* 20.

Farmers' Clubs.—I am not aware that in my communications on the establishment of Farmers' Clubs I cast a slur on the agriculturists of Berkshire, as implied by your correspondent "F.," at p. 823, my object being simply to show their necessity and advantages. If I did so it was unintentionally. He, however, certainly exposes, I will not say wilfully, a no inconsiderable degree of ignorance. First, he makes allusion to the work I quoted, at p. 777, which contains a descriptive account of the state of agriculture in Berkshire, under the title of "Knight's Journey Book of Berkshire," or, as he terms it, "an antiquated book by Knight relating to a journey through Berkshire," remarking "a description in his time would be a libel upon the country at the present day." So far from being an "antiquated" book, it was published as recently as 1840, so that I am in no fear of an action being maintained. He further says, "the 40 and 50 acre men are gone long ago, the present race of agriculturists rank as high in their pursuits as any, and the majority of them vie with the Norfolk men; I could name many who farm upwards of 1000 acres, and one with whom I am acquainted 2000." As to the opulency of landowners or the proprietors of large estates, to which he afterwards alludes, that has nothing to do with the question of the establishment of Farmers' Clubs; and, besides, in agriculture Berkshire is known to rank only as the 14th county. One statement, however, which he makes is too glaring to pass over. He says "With regard to Farmers' Clubs, we have many established for some years in the county, and well supported." I shall anxiously look forward for his reply to your inquiry; for my own part, I assert there is not one Farmers' Club established in Berkshire; and I give him the opportunity of refuting this by naming any. In inviting me to visit Berkshire, taking a journey through the central part, your correspondent could not be aware that he alighted on the very point of my locality; so that by accepting his invitation, I should derive no new information, but rather might impart some to him of the places he mentions, a slight knowledge of which he can only have gained by passing observations, residing as he does at the remotest part of Berkshire, at a place known only to its inhabitants. Berkshire, indeed, ranks some eminent agriculturists, but Farmers' Clubs are alike wanting in this as in other counties.—*H.*

Trap-rock a Manure.—Seeing reports that, if the railroads contemplated to be made through Radnorshire went on, it was likely there would be a great many valuable minerals discovered that would cause a great traffic on the line; and living in Cornwall, and all my life practically engaged in mining pursuits, I thought I would go and inspect the county; and I have been up through the county, but the formation of the county is so undulated, that there will not be much mineral discovered except there be deep cuttings. The only thing that I observed, that is likely to make a railroad pay, will be the transit of trap-rock from the hundred of Painscastle, which is a valuable manure.(!) I saw in a field, about three miles from Hay, about 20 tons of it hauled out for manure; a man was breaking it up; he called it marl, but it is a regular trap-rock. I went and saw the rock they raised it from, and it is plain to any person that knows anything about the different formations, that it was formed in a state of lava by volcanic action. I calcined a piece of it, and I found it contained a large portion of carbon—I should think 10 or 12 per cent., and not more than 40 of silica. I understand it has been analysed, but those analyses that are obtained at a low price (generally a pound) or a

guinea) never notice potash, soda, and the more valuable nutriments, and there are thus many people much deceived; as they get a specimen analysed, and it contains some valuable nutriment, but as there is no report of potash and soda and the silicates, it is considered not to contain any of those ingredients, which I will venture to say is the case in this mineral. The expense of ingredients to analyse for potash and soda would be four times as much as they charge for analyses. Any person wishing to know the different nutriment contained in trap-rock, had better look to Professor Johnson's account of trap as a manure, and there they will see the component parts of felspar and hornblend stated; and when mixed, as in the trap-rock, it contains all the nutriments of vegetation, where carbon is contained along with organic and inorganic. Any person wishing to satisfy himself that this rock is trap, has only to go and view it, and he will see that it was formed in a fluid state.—*Josiah Jenkins, Painscastle, Radnorshire.*

Agricultural Improvement.—Ever since I commenced farming I have had nothing less in view than the acme of perfection, and certainly each succeeding year has found me a few steps higher up the interminable ladder of improvement. My land is now in first-rate condition, and I am hard-up to know to what extent manure may be profitably applied. For instance, I put 25 tons per acre of good cake manure upon my Turnip fallow every four years, and get good average crops; but I want to ascertain how many tons I may increase it, getting better crops, and not being out of pocket. This no doubt might be done by actual experiment, but probably with loss. So much depends on the kind of soil, that I should think an analysis would be the best criterion, and bring one to the nearest possible conclusion which can be attained. Many of our landed proprietors who have the national welfare at heart come forward in a most liberal manner and try various experiments *pro bono publico*, and these are the parties upon whom this duty ought to devolve, for a failure to them is not worth a thought. It is well known that frequently among gentlemen, farming is a losing game, and we cannot wonder when we see the needless expense which is often incurred. Few consider how prejudicial this is to improvement. In looking over land, I have sometimes named to the occupier (who has been one treading in the steps of his grandfather), what a good example 'squire so and so set in a certain branch of farm management. He would directly reply, it would not answer to us who have to get our bread and cheese by farming; and, moreover, you may hammer at him as long as you like, but there is no convincing him to the contrary. In this way the whole advantage to be derived is lost; for farmers of this class have not the sense to gather up the Wheat and discard the chaff in the system, but depreciate it altogether as "all very well, Mister Ferguson, but it won't do.."—*Titus Oats.*

To Cure Bacon.—Can you, or any of your correspondents tell me if there is really any risk in having my bacon cured in a building but recently erected—say eight or nine months? My neighbours alarm me by citing numerous instances of bacon having been quite spoiled, so as to have to be buried, from having been cured in new houses; but as I happen to know of quite as many cases of its having been spoiled in old buildings, and bearing in mind that most people are in the habit of lime-washing their salting house, once at least, if not oftener in the year, without any ill effects of the kind, I am rather sceptical in the matter.—*Ignoramus.*

Gypsum and Sulphuric Acid to fix Ammonia.—I observed in one of the *Gazettes* for last year, that the gypsum for this purpose should not be burnt; where is it to be got in powder unburnt? I have the burnt gypsum sprinkled over all my cattle houses, three times a day, and then watered from the rose of a leaden watering pot with dilute sulphuric acid. It sweetens the houses much, but it is not yet quite effectual; perhaps from the gypsum being burnt.—*J. W. L.*

Drill Machine.—I have a drill of the fashion of the Suffolk drill, only more simple, with which I put in Barley, &c., at 44 furrows to the rod, or 22, or 11. I have invariably found the largest produce from the small furrows, and this season the difference between 22 and 44 was nearly a sack of Barley from half an acre in favour of 44.—*Thomas Hooper, Chilton, near Ramsgate.*

Societies.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

The Council of the Agricultural Improvement Society has issued an address to the landowners and occupiers of Ireland, in which, after urging upon them the propriety and advantage, and, indeed, the probable necessity, in the event of national distress, of Ireland depending upon its own exertions, they proceed:—"It is ascertained by the concurrent testimony and experience of the most enlightened agriculturists, that there is in this country and climate, no obstacle so powerful to the development of the true agricultural riches of the soil, as the wetness with which the land, even in favoured districts, is constantly infiltrated. It would be here unnecessary, and indeed in addressing an agricultural body so enlightened as the landed proprietors of Ireland, quite superfluous to describe the several ways in which moisture deteriorates the quality of the soil, abstracts its heat, and impoverishes the produce. They are facts fully established as parts of our authentic agricultural experience, and the remedy is also known. [illegible] by drainage; the removing the surplus moisture, and [illegible] the various agencies which mature the process of vegetation, to come into full play, and suitably reward the industry of the prudent farmer. Drainage is fundamental and anterior to all other agricultural improvements. You may apply the richest and most suitable manures, yet if your farm is wet and cold they are of no profit; but if the farm be brought into proper condition by judicious drainage, then, not merely, are artificial manures capable of yielding full returns, but the natural powers of the soil are brought to life, and luxuriant crops reward the labour upon land previously branded as barren. There is not an estate in Ireland, scarcely a farm, in which this change is not still to be effected. In every district may be seen tracts upon which labour could be thus expended with advantage, and in all those districts are to be found masses of people who may be in want of food, or of wages to purchase food, to whom the improvement of the soil should be the natural and most important object. It is for the landed proprietors of Ireland to place the wants of the land and the wants of the people in suitable connection; to support the one by employing them in the improvement of the other; to provide sufficient food and shelter for the body, and to give peace and contentment to the mind of the labouring poor, whilst the interest of the landlord is effectively promoted by this most valuable improvement in the condition of his property; and thus it may be rendered evident and recognised by all, how necessarily interwoven and mutually beneficial are the relations of society, and practically exhibit the proprietor as the benefactor, the friend, and the instructor of those whom Providence has placed under his charge. The question of drainage improvement, however, deserves the attention of the landed proprietors, and is recommended to them by the Council at the present juncture, not merely upon the grounds of beneficence and kindly intervention, but there are pecuniary advantages connected with thn occupation of the people in that way, which it is of great importance that the landed proprietors of Ireland should fully appreciate. The Council will, therefore, proceed briefly to consider them. If the present fears of a material deficiency in the amount of Potatoes, available as food, be justified by the event, it is certain that a large proportion of the poorer classes must be supported by some means, other than their own, during a considerable portion of the coming year. No matter through what channel the means of support may come, they must ultimately be paid for by the landed proprietors. If the action of the poor-law be extended so as to embrace a larger amount of destitution, this must be met by additional rates, for which, in the actual season of distress, the land must be liable. If the Government advance money, or give employment by public works, the sums advanced must be repaid, and hence must ultimately fall upon the land; and it is certainly well worthy of the attention of the owners of land, whether it would not be both better and cheaper to employ the poor of their estates in the improvement of those estates, under their own or their agent's guidance, than to have to support them in a poor-house, or on a distant public work, of possibly little advantage to each proprietor, and for which they may be equally chargeable. There is no investment now known so absolutely profitable as the improvement of land by drainage. A manufacturer realising 15 or 20 per cent. on the capital he embarks in trade, is considered as most successful, and a hundred competitors rush into the same line, and cut down his profits to the ordinary level of trade. But it is perfectly established by experience, in every kind of circumstances, that the expense of thorough draining land is repaid by the increased produce frequently in four years, and sometimes in three, under judicious management. Thus, the profit becomes 25 or 33 per cent. until the capital has been repaid. But the good is not then exhausted; the benefit to the land continues. It is certain, that to the labourer, to whom it gives employment; to the farmer, to whom it gives greater produce, and more certain returns; to the capitalist and proprietor, to whom it affords the most suitable and profitable investment; and to the state, to which it gives an improved soil, and an industrious population, there is no field for enterprise so important as the drainage of the land in the present circumstances of Ireland." The address after a few further paragraphs concludes thus: It is important to remark that the means which the Council of the Society felt it so useful to recommend, as a remunerative source of employment, have been considered also by his Excellency the Lord Lieutenant, and by her Majesty's Government, to be an object upon which the attention of the landed proprietors of Ireland might be beneficially fixed, and that for that object the Council has been requested by his Excellency to take charge of the allocation of a sum of 400*l.* to be dispensed in prizes, for the most extensive and best conducted system of thorough drainage, carried on in Ireland during the next year. The generous and beneficent donation of his Excellency, agreeing so fully with the views which the Council has long entertained, as to the importance of improvement by drainage, as useful equally to landlord and to tenant, encouraged the Council to give greater definitiveness and publicity to these sentiments, and to promulgate this address to the proprietors and occupiers of land in Ireland. (Signed) Clancarty, Chairman of the Council.

Farmers' Clubs.

Sturminster: *Annual Meeting.*—The Rev. A. Huxtable said, I cannot claim to be a great farmer; I am more like an agricultural adventurer, making all sorts of experiments; but these, I rejoice to say, are not unblessed with success. It is unfair to cry out, as many do, to such as me, "Show us your accounts," because my farm is yet in the infancy of high cultivation. Then, a good farmer is ever reinvesting his capital, and I have voluntarily, under the auspices of a kind landlord, put up, at my own expense, farm-buildings at a cost of 1600*l.*, thorough drained 86 acres of heavy land, and made sundry other permanent improvements, the execution of which I found it impossible to separate, in many cases, from the usual labours of the farm. Yet I am prepared to maintain and show, that in almost every case of cultivation, differing either in nature or in cost from that usually pursued by my neighbours, such deviation has been justified by what is the surest test of success, the profit accruing. I acknowledge the outlay to have been large, and that I should charge an interest of 10 per cent. upon it, and yet I confidently expect, from the valuations given to me of the crops and stock, that I shall receive a surplus of clear profit of 30*s.* to 40*s.* an acre, depending on the prices of agricultural produce at the time of selling the crops and stock. Speaking to you now, gentlemen, as one who has been making trials of improved modes of culture, I think I shall be doing almost as much service by detailing failures as by describing successful plans. And, first of all, which I beg to call Humbug No. 1 (a laugh), thin sowing I have tried largely, and believe it to be as unsafe and unprofitable a mode of proceeding as could have been recommended by names of celebrity. I have been a great loser by it, and so will you, except in certain cases. One supposed pre-requisite is, that the Wheat should be sown in September. Now, to take up your Swedes or Mangold Wurzel prematurely, and thus lose six weeks' growth (some 4 or 5 tons per acre), for the sake of 6 pecks of Wheat, cannot be called good husbandry. Moreover, the very act of tillering largely must tend to produce a coarse sample of grain, and if you have the misfortune to have land given to annual weeds, they will, upon ground uncovered by the Wheat-plant, shoot vigorously, and make your land look most unseemly; but if you sow plenty of seed, broadcast, and use lots of manure, so as to make the plant start vigorously, the Wheat I have found completely to stifle the weeds, and after harvest you see a weedless stubble. I believe that he who adds one real improvement to practical agriculture, is advancing the temporal interests of man. Therefore, gentlemen, I repeat an invitation to any and every farmer, to come and see the result and management of my small farm. To many of you who, having witnessed my plan of shed-feeding sheep, on boards, and the particulars of which have been published, I need not speak of my plan of shed-feeding; yet I will repeat, that the experience of this season has served to confirm my opinion of the great worth of the system. I venture also to recommend the method of keeping the stall-fed cattle on raised boards, their fore feet standing on saw-dust; thereby not only are the animals kept clean, as the manure will mostly fall through the interstices, the rest being scraped out; but the manure itself being free from long unmanageable straw, placed in a covered house, kept from sun, wind, and rain, is in a condition, being mixed with dry burnt clay, either for drill with green crops, or to be broadcast with corn. Last year I spoke of growing hay for pasture, as a relic of barbarism. Now I am still more confirmed in my hatred of this bigotry: I shall speak presently of the immense public loss sustained by dairy pastures altogether; but I refer now to hay however made whether from Clover, Lucerne, or natural Grass; I think I can prove what an unscientific and wasteful process hay-making is altogether, as it now is usually practised. Grass, in its green state, is known to be so much more fattening and milk-giving than hay, that some have even estimated that they are equal, weight for weight, in their value; but this seems doubtful, for the whole process of drying cut Grass is productive of loss—the exposure to sun, wind, and rain converts a very large proportion of the nutritious sugar, gum, and starch into insoluble woody fibre. To see this, it is only necessary to examine the dung of horses fed upon hay principally: it will be found to be chiefly composed of hard dry fibre, which, of course, has contributed nothing to the support of the animal. Now this loss may in a great measure be avoided, by only half drying the Grass, and stacking it with layers of straw, of equal bulk (not weight) and scattering evenly, by a sieve, fine salt, at the rate of 2lbs. per cwt. to the grass; I tried this method on Vetches this summer, in their half dried state; and the result has been most successful; the salt and the juices of the Vetches rendering the straw comparatively soluble and delicious to the cattle. Sir, I beg to repeat, that we ought to seek to raise farming to the rank of an art. But this cannot be done until a system of accurate weights and measurements is introduced into all our processes. In this one particular we are inferior to the Germans, Belgians, and French. I went, this summer, to see the Royal Agronomic Institution of Grignon, about 16 miles from Versailles, and amongst many other instructive parts of their system I particularly admired the record kept of the weight and measure of all their crops, whether of corn, or roots, or seeds; the number and weight of their sheaves, the produce of their Lucerne, &c.—everything is registered. Now I think this much desiderated among ourselves. Surely, long ago we ought by accurate and oft-repeated experiments, to have determined the value of our Swede crop, as given to sheep, cattle, or pigs; yet how varying and how vague the valuation set upon them by practical men. (Hear.) I have tried to contribute my mite by answering the question "What are Swedes worth per ton, when given to full grown Southdown wethers, under shelter from cold winds and rain?" I have found, then, that sheep, in these circumstances,

will eat on an average from 16 to 18lbs. a day, of cut Swedes, and that this food, joined with one pint of Oats, and half a pound of Barley straw, cut into chaff, and salted, will put on 3lbs. of live weight per week. (Hear.) Now I assume that three-fourths of this increase of live weight from week to week, in a full grown animal (where head, bones, and offal are almost a constant quantity) represents the increase of mutton :—

Dead weight, ¾ of 3 lbs., 2 lbs. 4 oz. at 7*d.*	1*s.*	3¾*d.*
Deduct 7 pints of Oats at ¾*d.*, attendance 3¾*d.* or ..	0	4½
	0	11¼

This 11¼*d.* will represent the value of Swedes consumed per week, that is, 7 × 17 = 119 lbs.; this makes 1 cwt. = 10½*d.*; or 1 ton = 17*s.* 6*d.* This is exclusive of the value of manure. To determine the value of the dung resulting from the consumption of a ton of Swedes by sheep eating a pint of Oats to every 17 lbs. weight of Turnips :—

The ash resulting therefrom, being about 1-40th of the grain, gives, for the 75 lbs. consumed, nearly ..	2
The ash in 1 ton of Swedes	17
	19
The whole weight of dung from Swedes being about 1-10th of roots = 2 cwt. or	224
Weight of dung from corn is nearly ⅙ or	37
	261

The nitrogen in this measure, according to Boussingault ("Economie Rurale," vol. 2, page 148), is 1 1-10th per ct. nearly, or 2¾ lbs. nearly, which at 7*d.* per lb. is = 1*s.* 7¼*d.* The ash, considering the proportion of potash, I think, may be fairly valued at 1½*d.* per lb.

That is, for 19 lbs. of ash	2*s.*	4½*d.*
And for the nitrogen	1	7¼
Making value of the manure	3	11¾

which being added to 17*s.* 6*d.* per ton, gives, under these circumstances, as the whole value of the Swedes, 1*l.* 1*s.* 5¾*d.* And now, gentlemen, allow me to narrate the circumstances of an experiment which so many of you have witnessed, an attempt to grow a crop of Swedes on very poor and high chalk land, which seemed in pasture to be worthless. I wanted to see whether I could raise a crop there upon the principle of carrying to the spot the ingredients of which that crop was formed. A large proportion of the Swede crop consists of water; when it is sliced, dried, and burnt, each ton of bulbs leaves 17 lbs. of ash, each ton of tops 33 lbs. of ash. Now these are the earth elements of a ton of Swedes. Besides these, there are certain others very important, which I call the air ingredients, because in burning they went back to the air, nitrogen and carbon, and sulphur. The ash, when analysed, is known to consist of a certain varying proportion of potash, soda, lime, chlorine, phosphoric acid, &c. To raise a crop of 20 tons of bulbs and 5½ tons of tops, there would be needed about 500 lbs. of ash; I believed, from the almost absolute sterility of the soil, that I could not calculate on the presence of these salts, save of lime, which the chalk contained abundantly. In the early stages of the plant's growth, there would be needed nitrogen in the shape of ammonia, and carbon in the shape of carbonic acid. From a rough analysis, I calculated that 30 bushels of wood-ashes, 2cwt. of Ichaboe guano, 50 lbs. of burnt bones, 22 lbs. of sulphuric acid, and 30 bushels of sawdust, would give me all the ash required, as well as a portion of the carbon; the atmosphere was to supply the rest. These were the chemical conditions; but next the mechanical were to be provided for. The ground was so steep that it could not be ploughed, save with a turnwrest plough, which I had not. Next, the manure must be exactly allotted, in close contact with the plant; this I tried to effect by making holes for the manure and seed; but the ground was too rubbly to admit of it. The labourers then went to the top of the hill, and hoed out drills, 2 feet apart, working down hill, the manure having been previously hauled to the highest point; a large wheelbarrow loaded with manure enough for two drills, was wheeled down the interval, and a handful of the contents placed at distances of 1 foot in each drill: children followed, dropping upon each deposit of manure 3 fingers' full of seed, mixed with fine soil, to prevent the strong manure burning the seed. In descending the hill they trod on their work, and this completed the process. The manure was mixed with two pot-loads of rotting sawdust, the great affinity of which substance for moisture would prevent the effect of drought; whereas the opposite danger of the manure being washed away by heavy rains was provided for by using an excess of sulphuric acid, which converted the highly soluble carbonate into comparatively insoluble sulphates of ammonia and potash. The crop, of which you saw this day some samples, on 5 acres of land, averaged 21 tons of clean bulbs the acre. The cost of the manure was 2*l.* an acre, of labour 19*s.* 6*d.*, horse labour 7*s.*, seed, rent, and rates, 12*s.* This crop, on the poorest imaginable land, at a cost of 3*l.* 19*s.* 3*d*, of 21 tons, at 12*s.* at the least, has produced a return of 15*l.* 15*s.* per acre or more than 300 per cent. Now let us compare the results of this husbandry with dairy farming. Three acres of pasture, at 27*s.* the acre rent, are allotted to the keep of one cow. (I hear a cry "that is too much"). I am quite aware that 2½ acres are said to be sufficient, but then the cows are kept in the straw-yard for three months, and as they will consume 2½ cwt. per week of straw to produce this food, another half acre would surely be required. Now the produce of one cow, for the year, is 200 lbs. of butter and 2 cwt. of cheese, and the curds will produce 42 lbs. of pork. Therefore, one-third of this, or 67 lbs. of butter, 75 lbs. of cheese, and 13 lbs. of pork, is the produce of one acre of pasture in one year. On the other hand, 1 cwt. of Swedes, given to sheep, under shelter, will produce 2 lbs. of mutton, or 1 ton 4 lbs.; one acre of land 20 tons, will produce 800 lbs. of mutton. It is not necessary to add more, sir, to prove the enormous injury done to the nation by keeping lands of this character in Grass. I am aware that a farmer letting his cows at 9*l.* a head to a dairyman is considered to adopt a safe mode of carrying on his business; but private profit is not the only consideration to which regard must now be paid. I think the implied meaning of protection given by Parliament to the agricultural body (and also given, be it remembered, to other interests) is, that it engages, on its part, to feed the nation, but that on account of our peculiar circumstances, this cannot be done unless foreign corn shall pay a duty. Let it be granted, gentlemen, that we are entitled to a certain amount of protection; yet, surely, on the other hand, we are bound, on our part, to do our utmost to provide corn and meat for the people. But how can we say that we are in earnest doing this, so long as this wretched dairy system is continued among us! Nor can we lose sight of the labourer's side of the question. Keep the labourer we must. Shall he be to us a burthen, or (as by improved farming he will become) the right hand of our strength and of our nation's power. Now, it is the glory of improved farming that the labourers must be employed, and if the wants of the people of England are to be supplied, so great will be the demand for his aid and skill, that he will find himself at length in a condition to demand fair remuneration. Mr. Chairman, much as I have been pleased with the proceedings of this evening, may I be permitted to submit one piece of criticism? When you gave to those old men a coat or a sovereign, in simple acknowledgment—not as a reward for the faithful discharge of their duty—you read from the award list "for forty years' servitude." I beg pardon if I express strongly, that as an Englishman, since no man can live on our shores as a slave, I object to such a term as "servitude" being applied to any class of my fellow men, but especially to that class whose voluntary services are so precious to us, and whose virtues we so highly prize. (The rev. gentleman sat down amidst loud plaudits, followed by hearty cheers.)

Sir C. Morgan's Annual Cattle Show, *Dec.* 9.—We are glad to have an opportunity of referring to Sir C. Morgan's long course of philanthropic exertions in the cause of agriculture. The following passages are extracted from the *Monmouthshire Merlin*: —"The venerable baronet of Tredegar has acquired fresh civic laurels, by another anniversary of what may be deemed a most important agricultural institution, of which he is the zealous founder. It is impossible to consider the amiable, anxious, and generous feelings and exertions of this venerable gentleman for the welfare of the farming interests, and, indeed, of all around him, and for the alleviation of poverty amongst the labouring classes, without admitting that to him may be well applied the language of a favourite writer, 'He who with a benevolence warm as the heat of the sun, and diffusive as its light, takes in all mankind, and is sincerely glad to see poverty, whether in friend, stranger, or foe, relieved, and worth cherished, makes the merit of all the good that is done in the world his own, by the complacency which he takes in seeing or hearing it done.' The career of Sir Charles Morgan is a bright example of the comprehensive blessings that may be conferred on the country by those to whom Providence has allotted a command of wealth and high station amongst their fellow men, and whenever his span of human existence terminates, a period which we trust may be still far distant, his name will go down to posterity with the Cokes and Spencers as the best friends of those who live by the soil—of agriculture." In the course of the evening of the day on which the Cattle Show took place, the following remarks were made by Mr. Colman, from America: "I congratulate you on the state of agriculture. The prices of produce are all that farmers can hope for. We should consider high prices in two aspects—if they were occasioned by scarcity, distress would be the result; but if from a great demand, it must show the prosperous state of the country. And I appeal to you, gentlemen, if there was ever greater prosperity than during last year. Look at your noble dock. You thought, when it was formed, that it would be large enough for all the necessities of your port; and what is the truth? Why, your dock is not large enough for the vessels that float in for your mineral wealth, and you want more room. Ships from almost every nation crowd within the already ample space of your dock, and you must increase your land accommodation. Look at a single fact, to judge of the prosperity of your own county. There were upwards of 17,000 tons of coal passed down over the railway which runs through Sir Charles Morgan's park, in one month! All ranks of society are linked together. As any one branch of commerce flourishes, so must agriculture. I will allude to another circumstance. I understand the difference between making railroads, and speculating in railroad shares. The latter is a curse to the community. Any mode of getting money, except by honest industry and legitimate enterprise, must prove a curse. I have been asked what were the advantages of roalroads. Why, I came from London to Swindon a few days since, and my fellow-travellers were six or seven drovers who had been to London. They took their cattle to the London market on Thursday—they sold them on Friday—and they were at home again on Saturday! and this was usually a 10 days' business with them, before they possessed the wonderful facilities offered by steam. The calculation in my country is this: In driving a fat animal 100 miles to market it loses 100 lbs. in weight—whereas in taking it by railway to market it loses nothing, and goes into the market as fresh as it left its shed. Thus the saving of time and the non-depreciation of the animal by travelling, compensate fully for the additional expense of transit. I shall be asked, when I reach my home, what struck me most forcibly in England. I shall then answer at large; but I may say now, that one thing strikes us all forcibly, and that is the contrast in the human condition—the contrast of enormous wealth by the side of destitution, which cannot be exaggerated. What is the remedy? Is a poor man the worse because his neighbour is rich! Certainly not. Is a poor man the worse for the wealth possessed by my distinguished and beneficent friend, Sir Charles! Assuredly not. Government should give the poor man a fair chance to accumulate. Education is wanted! The power of mind elevates men in their condition. Give this to every class. Exalt them in self-respect—in becoming pride—in laudable ambition to be greater and wiser. You have all heard of the subsoil plough—it does not disturb the top of the soil. No; it loosens the subsoil, and brings it into contact with the air and the blessed sun, which both enrich it and the upper soil. We want the great subsoil-plough education to do this for us—and when both soils come in contact, both shall be enriched."

Rebiebs.

Purdon's Irish Farmers' and Gardeners' Almanack for 1846. *Farmers' Gazette* Office, 23, Bachelors'-walk, Dublin.—It contains as full and perfect a Farmers' Calendar as any almanack we are acquainted with. It is in all respects an excellent Irish Farmers' Almanack, and it is as well suited for England or Scotland as it is for Ireland.

On the Domesticated Animals of the British Islands. Comprehending the Natural and Economical History of Species and Varieties; the Description of the Properties of External Form; and Observations on the Principles and Practice of Breeding. By David Low, Esq., F.R.S.E., Professor of Agriculture in the University of Edinburgh, &c. Longman, Brown, Green, and Longmans.

[Second Notice.]

We notice this work for the second time merely for the purpose of transferring to our columns a series of short paragraphs in which the author recapitulates the contents of one of the most interesting sections of his work—that on sheep. There are some curious instances, as for instance that of the Penistone breed, of the local permanence of inferior breeds in districts fitted for the cultivation of varieties which are superior both in carcass and wool. They are cases like these which indicate the value of works like the present, which place before the readers that information which will guide him safely to the selection of animals either for breeding or fattening, whose constitution and other qualities are best qualified to cope with, and take advantage of the circumstances in which he is placed. The following is the passage to which we have alluded:—1. The Zetland and Orkney Breeds, of the variety *brevicauda*.—They inhabit the most northerly islands, and are distinguished by their bearing a fleece of fine soft wool, largely intermixed with hairs. The purest of them are found on the remoter Islands of Zetland. They are hardy, wild, and of small size; and do not merit extension beyond the countries which they now occupy. 2. The Older Soft-woolled Sheep of Scotland.—They are of small weight, have long lank bodies, and bear a short soft wool, fitted for the manufacture of flannels, but deficient in the property of felting. These varieties are now nearly extinct, or confined to the remoter islands and islets of the Hebrides. 3. The Sheep of Wales, which may be divided into two classes; 1. The Sheep of the Higher Mountains, horned, of diminutive size, usually of a dark colour, and bearing soft wool, largely intermixed with hairs; 2. The Hornless Soft-woolled Sheep, likewise of small size, bearing wool of a soft texture, fitted for the manufacture of hose and flannels, but deficient in the property of felting. To the typical forms of these races all the Mountain Sheep of Wales are more or less allied. They are valued for the delicacy of their mutton, and are carried in numbers to the lower country, for the purpose of being fattened. They are hardy, but impatient of restraint, when removed from their native pastures. Allied in their characters to the Mountain Breeds of Wales are the Sheep of the Wicklow Mountains, now disappearing in the pure state, from the effects of crossing. 4. The Kerry and other Sheep of the high lands of Ireland, wild, slow in arriving at maturity, and producing a fleece of medium softness, but irregular, and mixed with hairs. 5. The Black-faced Heath Breed, inhabiting the central chain of heathy mountains and moors which extend from Derbyshire northward. These sheep have long been carried to the mountains of Scotland, and now extend all northward through the northern Highlands to the Pentland Firth. They are armed with horns, and are the hardiest and boldest of all the races of British Sheep. They have dark-coloured faces and limbs, and bear shaggy fleeces of coarse wool. Their characters change when they are naturalised in the less rugged mountains and moors. In the lower heaths of Yorkshire, they approximate, through the coarse and unthrifty breed of Penistone, to the larger sheep of the plains; in other cases they pass into the finer-woolled sheep of the commons, lower heaths, and forests. They produce a juicy and well-flavoured mutton, and are brought in great numbers

from the mountains, to be fattened in the lower country. 6. The Cheviot Breed, derived from a limited tract of green hills in the north of England, and thence widely spread over the mountainous districts of Scotland, and some parts of England and Ireland. These sheep somewhat exceed in weight the Black-faced Heath Breed: they are less robust, and less suited to a country of heaths, but yet they are amongst the hardiest of our Mountain Sheep. They are destitute of horns in both sexes, and bear wool of medium fineness, fitted for preparation by the card, and employed in the manufacture of the coarser woollen cloths. 7. The Old Norfolk Breed, reared in the heathy parts of the counties of Norfolk, Suffolk, and Cambridge.—They are a strong and agile race of Sheep, armed with horns in both sexes, bear a clothing of wool of medium length, and are greatly valued for the excellence of their mutton. They produce admirable crosses with the more highly cultivated breeds, and especially with the South Down, from which cause they are rapidly diminishing in numbers in the pure state. 8. The Breeds of the Older Forests, Commons, and Chases.—These vary in their aspect, size, and properties, with the localities in which they have been naturalised. They have often dark or gray faces and limbs, have sometimes horns, and are sometimes destitute of horns, and bear, for the most part, a short felting wool. They have been continually diminishing in numbers with the appropriation of commons and the improvement of the country, so that few now remain without a mixture of the more cultivated breeds. In the West of England, however, are still to be found the Dartmoor and Exmoor breeds in considerable numbers, the former occupying the high lands of Devonshire in the forest of Dartmoor; the latter, a rugged district of limited extent at the sources of the river Exe in Somersetshire. They are both very wild and hardy races of small Sheep, and differ from the other forest breeds by producing wool of medium length, and more fitted for preparation by the comb than the card. 9. The Ryeland Breed, the remains of some of the smaller fine-woolled varieties of the western counties.—These Sheep are horniess, of small size, and of good forms, patient of scanty food, and productive of a fine short felting wool, which was long the most esteemed for the making of cloth of any in England. This breed, from the substitution of the larger varieties, and the effects of crossing, has been long diminishing in numbers, and is now nearly extinct. 10. The Southdown Breed, derived from the chalky hills of Sussex on the British Channel.—It is to be classed amongst the down and forest breeds, but it has been made to surpass them all by the effects of breeding and careful culture. It has been widely spread over all the south-eastern counties of England, and has passed into districts beyond the countries of the chalk, taking the place of the pre-existing breeds of the downs and commons. The Sheep of this breed are destitute of horns, have dark-coloured faces and limbs, and produce a short felting wool fitted for preparation by the card. Their size varies with the locality, and the taste and opinions of the breeders; but they are of greater weight, and bear heavier fleeces, than the older Sheep of the Sussex Downs. They are adapted to a lower range of pastures than the Black-faced Sheep and Cheviot Breeds, and are better fitted for a dry and temperate climate than for a cold and moist one. 11. The Old Wiltshire.—This and the other varieties of the larger fine-woolled Sheep of the central counties of chalk, may be said to be now extinct beyond a few scattered remnants. They produced good felting wool, and fattened to a considerable weight; but they were of coarse forms, and have universally yielded to the progress of the more highly cultivated Southdowns. 12. The Dorset and Pink-nosed Somerset Breeds, naturalised in the calcareous district of the south-western counties.—They have horns in both sexes, bear a clothing wool of medium quality, and are noted, beyond any other breed, for the faculty of the females to receive the males at an early season. This latter property has caused them to be extensively cultivated for the rearing of house-lambs. They have now been much diminished in numbers by the effects of crossing, and the substitution of other breeds regarded as more profitable. Allied to these varieties is the Isle of Portland Breed, of small size, and of little economical importance beyond the narrow district which it inhabits. 13. The Merino Breed, derived from the mountains of Spain, but partially naturalised in England.—It bears the finest wool of any known race of Sheep. On account of this property it has been extensively diffused over a great part of Europe, and carried to America, the Cape of Good Hope, and the Colonies of England in Australia. The individuals, however, are of defective forms, of tender constitutions, deficient in the power of yielding milk, and slow in arriving at maturity. For these reasons, the Merino Breed, notwithstanding the abundance and excellence of its wool, has been received with little favour in England, and is deemed inferior in value to the more improved varieties of the country. 14. The Long-woolled Sheep, comprehending, first, the pure New Leicester Breed; and, secondly, the varieties more or less intermixed with it in blood, of which the principal are: 1st, the larger class of Lincolnshire Sheep; 2d, the Romney Marsh Breed; 3d, the Cotswold Breed; 4th, the Devonshire Notts; 5th, the Long-woolled Irish varieties. All these Sheep are of large size, are destitute of horns in both sexes, and bear long wool, unsuited for preparation by the card, but eminently fitted for preparation by the comb, and the manufacture of stuffs termed worsted. They are the kinds of Sheep more especially adapted to the plains, and the districts where artificial food can be reared in the necessary quantity. They have been continually increasing in numbers with the extension of tillage and the general improvement of agriculture. Of the several varieties, the New Leicester Breed occupies the first class with respect to form and the aptitude to fatten readily. The larger Lincolnshire, the Romney Marsh, the Cotswold, and the improved Devonshire Breeds, have each properties which render their cultivation profitable under particular circumstances. The Irish varieties have not yet generally attained to the perfection at which the others have arrived.

Miscellaneous.

On the Manufacture and Application of Manure (*Boussingault, vol. 2, p. 47*).—In agricultural establishments where the importance of manure is properly understood, every precaution is taken to insure its production and preservation. The expense so incurred is soon amply repaid. One may at first sight judge of the industry and intelligence of the farmer, by the attention he pays to his manure heap. It is a deplorable thing to see the negligence from which manure is wasted in the greater part of France;* in too many villages the dung heap is placed so as to receive all the drippings of the farm buildings as if the object were to wash it with as much rain-water as possible. The greatest secret of the successful cultivation in French Flanders, consists perhaps in the extreme care which is taken to collect everything which may tend to fertilize the soil. Agricultural societies, which are now so numerous, would render a real service if they would encourage by all the means in their power the economy of manure. To this end prizes might be proposed for those farmers who prepare their manure-heaps in the most rational way. The manure-heap should be as near the stables and cow-house as possible. The main object is to secure the following conditions. 1. That the moisture should not run off from the premises. 2. That the liquid which drains from it should be received into a common reservoir under ground, so that in dry weather it may be thrown back on the heap. 3. To prevent any moisture except that which falls immediately upon it from running into the yard. 4. That the yard shall be sufficiently large to prevent the necessity of piling up the manure too high. It is convenient to make the yard slightly concave, and to have the tank at the lowest point. The soil too should be clayey and impervious to water, and if there is not this advantage naturally, it must be obtained artificially. The waters of the dunghill, which are collected in the tank, are pumped up and returned to the manure when the surface becomes too dry. For this purpose, Schwertz recommends moveable spouts and tressils to convey the liquid to every part of the yard. The mouth of the tank is closed by a strong very firm wooden grating, of which the bars are sufficiently near to prevent any solid substance or straw from entering. A most important point is to take care that the inclination of the gutters is such that the urine from the stables and stalls shall run naturally into the manure heap. The litter, however abundant, does not absorb the whole of the urine, especially when the beasts are on green food: to neglect this arrangement is quite unpardonable. The materials of the dung heap must not be thrown carelessly upon the mass. They must be spread and divided so as to leave no cavities in which mould may be produced. They must be well compacted to avoid too rapid fermentation, which is always prejudicial when the heap is too loose. At Bechelbronn the manure heap is made so firm that a loaded waggon, requiring four horses, can pass over it without much difficulty. The depth to which the manure is laid is not a matter of indifference; besides the convenience of loading, which should not be forgotten, too great a depth would be injurious by causing too great a temperature, and should circumstances make it convenient to keep so thick a mass for a long period, decomposition would become so rapid as to occasion a heavy loss. Experience has shown that the depth of the manure should be somewhere between 5 and 7 feet. The heap usually slopes from the centre, for the convenience of drawing the waggons upon it. The practice in Alsace is to load upon the heap itself. To prevent its becoming too dry it is the custom in some districts to lay the manure in a northern aspect. This is certainly an excellent plan, but it is seldom practicable in a large establishment, where, in certain localities, the immediate neighbourhood of a large mass of materials in a state of decomposition may be disagreeable, if not unwholesome. A simple plan is sometimes adopted in the Department du Nord, viz., planting a row of Elms to shade the yard. This is far preferable to a roof, which has sometimes been proposed, the expense being far too great, the exposure to rain not being a great inconvenience, and the timber of the roof being liable to speedy destruction from the steam of the fermenting mass. If peculiar circumstances or the smallness of the farm do not permit the construction of a tank, and the subjacent soil is easily permeable by moisture, the essence of the manure will, to a great extent, be lost. In such cases the surface of the yard should be covered with a layer of soil, sand or turf, marl, or, in short, any substance capable of absorbing the moisture. This is a frequent practice with farmers in Alsatia.—*M. J. B.*

* This is, unfortunately, quite as much the case in England. Many of our best farmers, who are intelligent enough in other respects, suffer the essence of the farm-yard to be washed away from the want of proper tanks, and even where the position is such as to prevent the liquid manure absolutely running off, no pains are taken to prevent its being absorbed by the earth.

Notices to Correspondents.

Corn Steeped in Nux vomica—*Inquirer*—It will kill crows but not frighten them; it will not drive them away, although any that come will doubtless pay the penalty.

Cost of Wheat per Acre—*J H*—Please to excuse the delay of an answer till next week.

Damp Guano—*E D*—Mix it up with a lot of calcined gypsum (Paris plaster); that will make it dry enough to drill.

Drainage—*W C*—Drains placed up and down the ascent do "meet with the general approbation of scientific practical men," unless the ascent be excessive. You need not place broken stones over the tiles.

Feeding in Stalls or in Hammels—*A Gloucestershire Landholder*—Supposing these methods to be alike in their influence on the health of the cattle, then where straw is abundant the latter is to be preferred; but where a large part of the farm is Grass-land we should prefer the former. We will refer you to authorities next week.

Fences—*Inquirer*—A ditch should be made on the upperside of a fence.

Fork Culture—*Mr. Paterson* says, "I have been using forks for a considerable time past, and find them excellent. They are larger than your sketch at p. 849, viz., 14 inches deep and 7 broad, and handle 34 inches. My people find great relief in the long handle; it does not fatigue them nearly so much as the spade, which is generally 4 to 5 inches inches shorter. As regards the time required to fork an acre, this depends of course on the texture of the soil. A light stony soil, in Lincolnshire, was lately dug at the rate of one-thirteenth of an acre, *i. e.*, 12 perches a day, 12 to 14 inches deep. We were told this by the farmer who occupies the land, and superintended the work, and he paid 25*s.* per acre for it. Now we have been lately paying for digging, not however by the fork, but by the grafting-tool (a straight, narrow, and deep spade), and it cost us 4½*d.* a perch to dig it a foot deep: a strong man cannot do more than 5 or 6 perches in a day. But it is a stiffish soil. You thus see that there is a great variety in the extent which can be mastered.

Horse Keep—*Inquirer*—Do not stint them—it is not economical to do that. Give them, in addition to their "bushel of Oats and 2 bushels of Carrots a week," as much hay as they will eat. Not knowing the size of your horses we cannot guess at this—but it will probably be from 10 to 20 lbs. a-day. Our horses eat about 2½ bushels of Oats a-week, about 3 cwt. of Carrots, and straw *ad lib.*

Labourers per 100 Acres—*Inquirer*—Five men per 100 acres of arable land, and 1½ per 100 acres of pasture, exclusive of extra work at particular seasons, may be about the thing.

Flax-dressing Machine—*Monmouth*—Next week.

Peat Draining-tile—*J Russell*—We shall be able to answer when we shall have heard from Mr Smith. As we taste it the peat is simply cut and dried, and then ready for use.

Relation of Straw to Grain in Weight—*Inquirer*—Most Wheat ricks contain twice as many cwt. of straw as of grain.

Salting Pork—*To Inquirers*—The best time for salting fat pork in the way described is when the weather is very cold during the coldest part of the winter season. *D. M.*

Small Farm, to Purchase—*H Lowton*—You must advertise for it. We have no means of assisting you.

Stall Feeding.—*P M Fisher*—Cattle must be fed oftener than twice a day—the oftener the better, provided such a quantity only is given as will be eaten clean up each time. We feed our cattle three times a day, and they eat about 150 lbs. of Swedes daily each. Our horses get no hay; they get Oats, Carrots, and straw—they will eat Swedes but do not much like them, and they will not eat Mangold Wurzel. You can give your chaff-refuse from the thrashing-machine to your beasts just as you would cut straw. Feed your pigs on Potatoes and Barley-meal. Fuller next week.

Subsoil Plough—*N N*—We greatly prefer Smith's.

The Lease—Will a "*Looker-on*" be kind enough to excuse the unavoidable delay of his valuable paper?

To Cure Bacon—*Curly Tail* says "I am about to kill two pigs, weighing, in my opinion, about 5 cwt. each, and am told by my herd, who has not been accustomed to see swine of that weight, that he despairs of curing them effectually. I shall be grateful, therefore, to any of your correspondents for a recipe which experience has proved to be a safe pickle."

When does the Sun Rise on the Shortest Day, and at what Point of the Compass—*Inquirer* must first tell us his latitude.

*** As usual, many communications have arrived too late.

Markets.

COVENT GARDEN, Dec. 27.—The market still continues to be well supplied with Vegetables, and Fruit has also been sufficient for the demand. Among Pine-apples are many handsome specimens, which are offered at nearly the same prices as quoted in our last Report. Grapes also have not altered since last week. The supply of Apples continues to be well kept up, and good samples meet with a ready sale. Pears are good in quality, and command a tolerably brisk trade. Oranges are becoming more abundant; but in consequence of the increased demand, prices for them, and also for Lemons, are higher than they were last week. Nuts remain nearly the same. Of Vegetables the supplies of most articles are sufficient for the demand. Cauliflowers are rather scarce; but Broccoli is abundant, and Savoys, Brussels Sprouts, and other winter greens, are plentiful. Carrots and Turnips are excellent in quality, and sufficient for the demand. Potatoes have altered very little in price since last week; trade for them is not brisk. Seakale and Rhubarb are more plentiful; and the same may be said of French Beans. Asparagus, although rather small, is good in quality. Celery, both red and white, is abundant, and Lettuces, Endive, and other kinds of salading, are sufficient for the demand. Cut Flowers chiefly consist of Euphorbias, Bignonias venusta, Epiphyllums, Acacias, Heaths, Heliotropes, Cinerarias, Pelargoniums, Camellias, Chinese Primroses, Chrysanthemums, Violets, and Roses.

FRUITS

Pine Apple, per lb., 4*s* to 6*s*	Lemons, per dozen, 1*s* to 2*s*
Grapes, Hothouse, per lb., 3*s* to 6*s*	— per 100, 7*s* to 14*s*
— Spanish, per lb., 9*d* to 1*s*	Almonds, per peck, 6*s*
— Portugal, p. lb., 1*s* to 2*s* 6*d*	Sweet Almonds, per lb., 2*s* 6*d* to 3*s*
Melons, Spanish, each, 4*s* to 10*s*	Filberts, English, p. 100 lbs., 40*s* to 45*s*
Apples, Dess., per bush., 4*s* to 10*s*	Nuts, Cob, per 100 lbs., 60*s* to 65*s*
— Kitchen, 2*s* 6*d* to 6*s* 6*d*	— Barcelona, 20*s*
Oranges, per dozen, 1*s* to 2*s*	— Brazil, 16*s*
— per 100, 4*s* to 14*s*	— Spanish, 14*s*
— Seville, per 100, 14*s*	Chesnuts, per peck, 4*s* to 6*s*
— per dozen, 2*s* to 2*s* 6*d*	Pears, per half-sv., 3*s* to 10*s*

VEGETABLES

Cabbages, per doz., 6*d* to 1*s* 6*d*	Celery, per bunch, 6*d* to 1*s*
— red, per doz., 2*s* to 3*s*	Cardoons, each, 6*d* to 9*d*
Brussels Sprouts, p. half-sv., 1*s* to 2*s*	Parsnips, per doz., 3*d* to 1*s*
Savoys, per doz., 6*d* to 1*s*	Scorzonera, per bundle, 1*s* to 1*s* 6*d*
Cauliflowers, per doz., 3*s* to 6*s*	Salsify, do., 1*s* to 1*s* 6*d*
Broccoli, Brown, per bdle., 6*d* to 1*s* 6*d*	Onions, per bushel, 3*s* 6*d* to 3*s*
— White, 1*s* 6*d* to 2*s*	— pickling, per half-sv., 2*s* to 3*s*
Greens, per doz. bunches, 2*s* to 3*s* 6*d*	— Spanish, per doz., 1*s* 6*d* to 4*s*
French Beans, per 100, 2*s* 6*d* to 3*s*	Shallots, per lb., 6*d* to 8*d*
Sorrel, per half-sieve, 9*d* to 1*s*	Endive, per score, 6*d* to 1*s*
Potatoes, per ton, 80*s* to 100*s*	Lettuce, per score, Cabbage, 6*d* to 9*d*
— cwt., 4*s* to 5*s*	— Cos, 6*d* to 1*s*
— bushel, 2*s* 6*d* to 4*s* 6*d*	Radishes, per doz. bunches, 4*d* to 6*d*
— Kidney, per bushel, 3*s* to 5*s*	Mushrooms, per pottle, 1*s* to 2*s* 6*d*
Turnips, per doz., 1*s* to 2*s*	Small Salads, per punnet, 3*d* to 4*d*
Red Beet, per doz., 6*d* to 1*s* 6*d*	Fennel, per bunch, 3*d* to 6*d*
Carrots, per doz. bchs., 2*s* to 3*s*	Savory, per bunch, 4*d* to 6*d*
Horse Radish, per bundle, 1*s* 6*d* to 3*s*	Thyme, per bunch, 4*d*
Seakale, per punnet, 1*s* to 2*s*	Watercress, p. 18 sm. bun., 4*d* to 6*d*
Rhubarb, per bundle, 1*s* 6*d* to 2*s*	Parsley, per bunch, 1*d* to 3*d*
Asparagus per bundle, 3*s* to 10*s*	— Roots, per bundle, 6*d*
Cucumbers, each, 1*s* to 2*s*	Tarragon, per bunch, 6*d*
Spinach, per sieve, 9*d* to 1*s* 6*d*	Mint, per bunch, 2*d*
Leeks, per doz. bunches, 1*s* to 2*s*	Marjoram, per bunch, 4*d*
Garlic, per lb., 6*d* to 8*d*	Chervil, per punnet, 3*d* to 4*d*

POTATOES.—Southwark, Waterside, Dec. 22.

The supply to this market during the past week was very limited, but in consequence of the wind being favourable the Potatoes arrived in tolerable condition; but the trade at the Waterside was not so good as it usually is when the supply is short, as many of the large retailers are getting Potatoes from the various railway stations and steam-boat wharfs, besides which the consumption always decreases as the prices advance. But there are other causes which only apply to the present season. A large class of persons do not eat Potatoes in consequence of the disease, fearing that they are deleterious; and there are a still larger number of persons that abstain from consuming Potatoes lest they should deprive their poorer neighbours of the article of food which the scanty means of the necessitous can best provide for their families, and it is generally considered that the misplaced sympathy of the latter is equal to the absurdity of the former.—The prices ranged as follows: York Reds, from 70s to 120s per ton; ditto Regents, from 70s to 130s per ton; Scotch Reds, from 80s to 90s per ton, but there were some fresh cargoes that arrived at the close of the week, when 100s per ton was asked, but there was comparatively few sold at that price; some fine samples that came by the steam-boats realised 100s per ton; some small cargoes of Jersey Blues were sold at from 80s to 85s per ton, but the samples being too small for this market the demand for them was very limited.

An Account of the number of Sacks (1½ cwt. each) of Potatoes delivered from ship, in the Port of London, during the following periods:—

	Sacks (1½ cwt.).
Three months ending Saturday, December 3, 1842	404,400
,, ,, ,, 2, 1843	315,800
,, ,, ,, 7, 1844	381,800
Average	367,100
Three months ending Saturday, December 6, 1845	195,400
Less this year by	171,700

The prices fluctuated in 1842-4-4 from 40s to 90s per ton; the present season the price has varied from 30s to 180s per ton. The supplies of 1842 came three weeks earlier than this year, but that only affected the above comparison 24,000 sacks.

William Ruston, City Corn-office.

SMITHFIELD, Monday, Dec. 22.—Per stone of 8 lbs.

	s.	d.	s.	d.		s.	d.	s.	d.
Best Scots, Herefords, &c.	4	0	to 4	6	Best Downs & Half-breds	4	2	to 4	6
Best Short Horns	4	0	4	4	Best Long-wools	4	4	4	8
Second quality Beasts	3	0	3	8	Ewes and second quality	4	0	4	4
Calves	4	4	5	4	Pigs	4	0	5	0

Beasts, 1289; Sheep, 11,200; Calves, 46; Pigs, 200.

This being so near Christmas-day it is almost a holiday market; the demand is very small, and the supply of Beef, although small, is with difficulty disposed of at a reduction of about 2d per 8lbs.—Good Mutton is scarce, and the trade for it quite as good as of late—in some instances the very best qualities have made rather over our top quotations.—Veal and Pork continue a brisk trade.

Friday, Dec. 26.

The supply of Beef is small, but quite equal to the demand; the prices remain as on Monday.—Mutton is also very short, but very little is wanted; the quantity has, however, an effect on the trade, and the best qualities are readily disposed of at rather more money.—Good Veal is scarce and dearer, a prime Calf being worth fully 5s 8d.—Pork trade is steady.

Beasts, 441; Sheep, 1287; Calves, 22; Pigs, 87.

41, West Smithfield.

HOPS, Friday, Dec. 26.

Nearly the whole of the bags are sold, and there is but very few fine-coloured Hops remaining. It is generally believed, that should Sir R. Peel again alter the Corn-laws he will repeal the Malt-tax, in which case there must naturally be a great increase in the consumption of Hops; and with the small stock on hand we may reasonably expect a considerable advance in prices. The market (for the time of year) is very firm.

Patteson & Smith, Hop-Factors.

MARK-LANE, Monday, Dec. 22.

The supply of English Wheat from Essex, Kent, and Suffolk, was again very small this morning, and the trade opening with more confidence it was realised at an advance of 1s. to 2s. per quarter upon the prices of this day se'nnight; free Foreign was held firmly at late prices, but transactions were limited; bonded and floating cargoes were rather more inquired after, and several sales were effected at prices which have not been obtainable of late. Fine Malting Barley sells freely, but inferior continues difficult of disposal. Beans and Peas support our quotations. The arrivals of Oats are good, and meet moderate sale at about 6d. to 1s. below the rates of last Monday.

Friday, Dec. 26.

There has been very little addition to the supply of any description of Grain since Wednesday; the arrivals of Irish Oats, however, are considerable. We have had quite a holiday Market this morning, and where sales of English Wheat have been made, Monday's prices were fully maintained; there was some inquiry for Bonded, but we did not hear of any transactions. All other articles remained unaltered.

Kennedy and Lee.

DORKING, SURREY.—TO NURSERYMEN.

TO BE DISPOSED OF immediately, the old-established NURSERY BUSINESS OF MR. ROBERT WESTLAND, in an eligible situation at Dorking, fronting the Turnpike-road. The whole of the Stock to be taken at a valuation. The commodious House, with the Seedshop, useful Out-buildings, and Nursery Garden, is let at a moderate Rent, and may be entered upon immediately.

For particulars, apply to Messrs. Hart & Hart, Solicitors, Dorking, Surrey.

TO BE LET on Lease, with immediate possession, an old established NURSERY and SEED BUSINESS in the vicinity of London, doing a good trade, the Stock and Glass may be taken or not.—Apply to Hurst and M'Mullen, 6, Leadenhall-street, London.

TO NURSERYMEN AND OTHERS.

TO BE LET, at Wellingborough, a town on the line of the Birmingham Railway, an excellent and old-established NURSERY GROUND, containing about Two Acres of Land, surrounded by a brick wall. A roomy and very commodious dwelling is attached, together with stabling and various out offices. Rent 25l. per annum.—Apply to Mr. Robbins, Auctioneer and Accountant, Wellingborough, to view the premises and land, or to A. B. C., *Railway Bell* Office, 335, Strand, London.

THRASHING MACHINES, made Warranted not to Damage the Straw.—Mrs. MARY WEDLAKE, Widow of the late Mr. THOMAS WEDLAKE, of the original Fairkytes Iron Works, Essex, and 118, Fenchurch-street, opposite Mark-Lane, City, established upwards of 40 years, begs respectfully to remind Agriculturists that she continues to manufacture these excellent Machines, made, and first introduced, by her late husband these 30 years, and now much improved. Warranted not to damage the Straw. Numerous references to parties using the Implement may be had.

Patent light Ploughs, and Superior Dressing Machines, also patent Chaff-cutting Machines made on scientific principles, may be seen at 118, Fenchurch-street, repository opposite Mark-lane; also, Horse-Rake, and Dingle's new Hand Dibbling-Machine so much approved of. City Repository for Agricultural Implements, 118, Fenchurch-street, opposite Mark-lane.

DRAINING TILES.

AINSLIE'S PATENT IMPROVEMENTS.—For Making and Drying Draining Tiles of the 1st Class. Gentlemen having works in operation, or who are about to erect them, will find the above worthy their attention.

The Process combines Effect with Economy, as Tiles can be made ready for Burning at all seasons; generally from ten to thirty hours, according to the nature of the clay. To be seen at Alperton, Acton, Middlesex; Mr. Howe, Engineer, 119, Great Guildford-st., Southwark; the Polytechnic Institution, Regent-street, London. Particulars may be had from John Ainslie, Alperton, Acton, Middlesex.

CHEAP AND DURABLE ROOFING,

AND THE BEST RESISTER OF FROST FOR GARDEN PURPOSES.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers and only Patentees of THE PATENT ASPHALTED FELT FOR ROOFING, and which for many years has been in extensive use for Roofing Houses, Verandahs, all kinds of Farm Buildings, Sheds, and for COVERING GARDEN FRAMES, TO PROTECT PLANTS AGAINST THE EFFECTS OF THE FROST, beg to call the attention of Gardeners and others to their superior article, *which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and obtained the Prize for being the best and cheapest article for roofing*, &c., and is also patronized by Her Majesty's Board of Ordnance, Commissioners of Woods and Forests, the Hon. the East India Company, and the Botanical Gardens, Regent's-park. It is extensively used in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference is made. This Felt is composed of the strongest and most durable materials, and is saturated with the BEST OF ASPHALTE OR BITUMEN (the same as selected and used by Sir Isambert Brunel for the Thames Tunnel, being found the most elastic and effective resister of wet). NO OTHER FELT HAS THIS ASPHALTE BUT F. M'NEILL & CO.'s, and which renders it impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price Only One Penny Per Square Foot.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience (which contain much useful information), from Noblemen, Gentlemen, Gardeners, Architects, and Builders, sent free to any part of the Town or Country, and orders by Post executed.

The new Vice-Chancellor's Courts, the Offices attached, and Passages leading to Westminster-hall, Dr. Reid's Offices, and other Buildings at the New Houses of Parliament, are roofed with F. M'Neill and Co.'s Felt, and is known by its having the appearance of lead roofs.

☞ The Public is respectfully cautioned against misrepresentation, as the only Works in Great Britain where the above Patent Roofing is made is F. M'NEILL & Co.'s Manufactories, Lamb's-buildings, Bunhill-row, London.

POTATO FLOUR MACHINERY.—The Subscribers will be happy to treat with parties requiring machinery for the manufacture of Potato Flour.

J. & J. SKED, Engineers.

Dunbar Foundry, East Lothian, N. B.

On the 1st of January, 1846 (to be continued Quarterly), will be published PART I. of

THE JOURNAL OF THE HORTICULTURAL SOCIETY OF LONDON, containing 96 pages in 8vo with one Coloured Plate and other Illustrations, price 5s.

In this work it is intended to publish periodically an account of the Proceedings of the Society, the Journals of the Society's Collectors, Papers on Horticultural Practice, or Subjects connected with Gardening, Reports upon the new Esculents, Fruits, or ornamental Plants, that may be from time to time introduced, an account of all Experiments tried in the Garden, and such other matter bearing upon Horticulture as may appear interesting to the Public. It will be distributed gratuitously to the Fellows of the Society, instead of the 4to Transactions; which will be discontinued after the completion of the current volume.

Fellows, Corresponding Members, and others, are invited to forward communications upon all matters *of either theory or practice*, to the Vice Secretary, at the House of the Society, 21, Regent-street, London.

LONDON NEWSPAPERS supplied with regularity in the Country, from the old established Newspaper Office, 15, Coventry-street, Haymarket, T. MUDIE and SONS, Agents for the Gardeners' Chronicle and Agricultural Gazette, beg to inform those who intend to begin the year as subscribers to that excellent paper that, to insure regularity in its delivery, they print the entire address of their customers on the covers, when ordered for six or twelve months. T. M. & Sons are also Agents for all the other London Newspapers, a new list of which will be forwarded on application. Writing Paper and every description of Stationery at the lowest cash prices.

Mudie's Newspaper Office, 15, Coventry Street.

Dedicated by Permission to the Right Hon. THE EARL OF AUCKLAND, K.C.B., Vice President of the HORTICULTURAL SOCIETY,

THE ANNALS OF HORTICULTURE & YEAR-BOOK OF INFORMATION ON PRACTICAL GARDENING, containing 560 pages of Letter-press, 136 Illustrations, and a beautifully-coloured Frontispiece. Price 16s.

Houlston and Stoneman, 165, Paternoster-row, and all Booksellers.

THE FARMERS' RESOURCES FOR MEETING THE REDUCED PRICES OF THEIR PRODUCE. By Hewitt Davis, Estate Agent, Spring-park, near Croydon, and 3, Frederick's-place, Old Jewry, London, Author of "The Injury and Waste of Corn from the present practice of too Thickly Sowing." Second edition. "I would have farmers look to the means which modern science affords them for lessening their expenses and increasing their returns."

London: A. Redford & Son, London-road; Simpkin, Marshall, & Co., Stationers'-court; J. Ridgway, Piccadilly; and F. Waller, 49, Fleet-street. 1845. Price 1s. 6d.

On the 1st of January will be published,

THE HORTICULTURAL MAGAZINE, beautifully illustrated with eight Engravings, and a splendid coloured group of new Flowers, containing a popular and original description of every new Flower, Plant, and Shrub, introduced during the past year, together with 96 columns of Original Treatises and practical Papers on Flowers, Fruits, and Vegetables.

Houlston and Stoneman, Paternoster-row, and all booksellers.

THE GARDENERS' CHRONICLE.—The vol. for 1845 is offered, when completed, for 22s., a clean and perfect copy. Also the QUARTERLY REVIEW, in Nos. for the last 13 years, 1833 to 1845 inclusive, for 8l.—Direct to P. L. T., care of Mr. Jones, Printer, Ludlow.

THE GARDENERS' CHRONICLE from the Commencement to January 1st, 1846, warranted clean and perfect. Five volumes—the three first half-bound, the two last unbound. Price 6l. 6s.—Apply to Messrs. Mudie & Co., 15, Coventry-street, Haymarket.

Now ready, price 4s. 6d., neatly half-bound (with numerous Woodcuts).

THE COTTAGER'S MONTHLY VISITOR, FOR THE YEAR 1845. This Work is continued in Numbers, price 4d. each, and forms a Manual of Religious Instruction and Domestic Economy, suited to Family Reading, the Parochial Library, or the Servants' Hall. Its contents include Scriptural Exposition, Instructive Tales, Hints on Gardening and Agriculture, short Extracts from the best Authors, and occasionally from the Public News. The Volumes are sold separately, and are included in the List of Books recommended by the Society for Promoting Christian Knowledge.

Rivingtons, St. Paul's Churchyard, and Waterloo-place.

MR. GOADBY having discovered a mode of preserving objects of NATURAL HISTORY, and especially the soft Invertebrata, with a success not before obtained, and, having spent the greater part of his life in perfecting the display of the structure of Insects, Mollusca, and other Invertebrata, has formed a collection of such preparations, which he is now, in consequence of the state of his health and other reasons, desirous to dispose of for 500l. This sum, which is much below its actual value, it is proposed to raise by subscription, in order that the Collection may be presented to some Public Museum. Mr. Goadby has made known his processes and preserving fluids through the medium of the British Association, at the meetings of which body, as well as at other public assemblies, the specimens have been exhibited; and the value of both the processes and results has been fully recognised by Naturalists and Comparative Anatomists.

Several specimens in Mr. Goadby's Collection are the result of many months' assiduous labour, and are unique. The number of the specimens is upwards of 150.

THE FARMERS' HERALD, a Monthly Journal of Practical and Scientific Agriculture, Rural Economy, and General Intelligence. Vols. I, 2, 3, covered, 3s. each. Also, THE FARMERS' HERALD ALMANAC FOR 1846, price 2d. in books, or 3d. in sheets, stamped.

London: NEWBERY and TERRY, 5, Hatton-garden; Chester, W. H. EVANS, Eastgate-street, and all Booksellers.

FENCING, GYMNASTIC, AND CALISTHENIC EXERCISES.

MR. J. CHIOSSO, Superintendent of the above branches of physical education at University College, London, begs to announce that his Academy, 21, New-road, corner of Gower-street, is open on Monday, Tuesday, and Thursday from 10 till 7 in the afternoon, and will be open every day during the Christmas Holidays. Exercises adapted for peculiar cases of Debility or Deformity will be attended to individually at convenient hours. Schools and private families attended. For terms apply at the Academy.

THE PEOPLE'S MEDICINES.—These Medicines are introduced to the Public by one who, while he laments the impostures of the day, believes that those impostures may be defeated (without the unconstitutional interference of the Legislature) by supplying the public with a complete set of approved remedies, at the most moderate price, and under the sanction of high medical authority. Such are "THE PEOPLE'S MEDICINES," prepared from Prescriptions most carefully selected and arranged by an eminent Physician now living, whose name, if published, would carry great weight. They are also accompanied by his directions and advice.

The object is twofold, viz.: first to counteract the dangerous use of advertised Medicines, called Universal, which profess to cure every disease with a single agent—an assertion at once unprincipled and absurd—and, secondly, to furnish the Public with the best remedies for each complaint, at about one half the price usually charged for Patent Medicines, thus combining *cheapness* with *efficacy* and *safety*. The latest discoveries, both Foreign and English, have been made available, and will continue to be so, as soon as they are established by a safe experience of their merits.

The advance of Chemical Science renders secrets in Medicines impossible. A few Patent Medicines may be efficacious, but their ingredients and composition are no secrets to the regular Practitioner. The aim in "THE PEOPLE'S MEDICINES" has been to retain whatever has proved useful, and improve it by the application of eminent talent and modern discovery; and to reject whatever is dangerous or injurious.

"THE PEOPLE'S MEDICINES" are compounded of the purest ingredients, and to prevent inferior imitations, the words, "THE PEOPLE'S MEDICINES" are engraved in the Government Stamp. Directions for use, with advice to the Patient, accompany each article, and will be found full and explicit. The general charge is 1s. 1½d., but some few, containing very expensive ingredients, are necessarily charged higher. The Medicines are named and numbered as follow:

1 Bilious Pills, for constant use
2 Bilious Pills, for occasional use
3 Dinner Pills, 2s. 9d.
4 Chamomile Pills
5 Digestive-Stomachic Pills, 2s. 9d.
6 Gout Pills
7 Rheumatic Pills
8 Cough Pills
9 Asthmatic Pills
10 Nervous Pills
11 Dropsy Pills
12 Scrofula Pills, 4s. 6d.
13 Syphilitic Pills, 2s. 9d.
14 Pills after Mercury
15 Diarrhœa Pills
16 Ague Pills, 2s. 9d.
17 Spasmodic Pills, 2s. 9d.
18 Steel Pills
19 Female Pills
20 Vegetable Tonic Pills
21 Night Pills, for rest
22 Aperient Pills, for warm climates
23 Rhubarb & Soda Pills
24 Rhubarb and Ginger Pills
25 Quinine and Camphor Pills, 2s. 9d.
26 Epileptic Pills
27 Diuretic Pills
28 Lettuce Pills
29 Squill Pills
30 Laxative Night Pill with agreeable morning draught
31 Sudorific Drops
32 Cough Mixture
33 Voice Candy
34 Lozenge for sweetening the breath
35 Antacid Lozenge
36 Pulmonic Plaister
37 Preventive of Sea Sickness
38 Essence of Chamomile and Ginger
39 Essence of Taraxacum (Dandelion) 2s. 9d.
40 Essence of Sarsaparilla, 4s. 6d.
41 Scorbutic Wine, 11s.
42 White Gravel Powders
43 Red Gravel Powders
44 Pile Powders
45 Pile Ointment
46 Chap Ointment
47 Chilblain Liniment
48 Itch Ointment
49 Ointment for Burns, Scalds, and Painful Sores
50 Eye Ointment
51 Tooth-ache Tincture
52 Embrocation for Sprains & Bruises
53 Ringworm Ointment
54 Nursery Aperient Syrup
55 Teething Syrup
56 Hooping Cough Syrup
57 Fever Powders
58 Worm Powders
59 Worm Balsam
60 Gonorrhœal Electuary
61 Tonic Lavement, 2s. 9d.
62 Nervous Lavement, 2s. 9d.
63 Scrofula Powders for bathing, &c., 2s. 9d.
64 Cheltenham Chalybeate Spa Powders
65 Harrowgate Sulphur Spa Powders (New well)
66 Leamington Spa Powders
67 Buxton Saline Spa Powders
68 Seltzer Spa Powders
69 German Spa Powders (Pouhon)

The six Spa Powders contain all the virtues of the various Mineral Springs. Each packet (containing 24 Powders, with directions for immediately producing the Water represented) is charged 2s. 6d.

These Medicines are prepared (under the immediate superintendence of a Member of the College of Surgeons) at the People's Medical Dispensary, London; and are supplied through the Wholesale Houses. Medicine Chests, containing all, or any number of the remedies enumerated, adapted for Ships, Travellers, and those living at an inconvenient distance from medical aid, may be had at proportionate prices. All the Medicines may be ordered of any Chemist by number or name.

LONDON AND BIRMINGHAM CHART.—The first of a Series of RAILWAY CHARTS, with hundreds of Illustrations, Topographical, Archæological, Mechanical, Architectural, &c., will appear in the RAILWAY CHRONICLE of January 10th.

The RAILWAY CHRONICLE may be ordered of any Newsvender price 6d. stamped, to go free by post.

LONDON AND SOUTH-WESTERN CHART.—The first of a Series of RAILWAY CHARTS, with hundreds of Illustrations, Topographical, Archæological, Mechanical, Architectural, &c., will appear in the RAILWAY CHRONICLE of January 17th.

The RAILWAY CHRONICLE may be ordered of any Newsvender price 6d. stamped. to go free by post.

BRIGHTON RAILWAY CHART.—The first of a Series of RAILWAY CHARTS, with hundreds of Illustrations, Topographical, Archæological, Mechanical, Architectural, &c. will appear in the RAILWAY CHRONICLE of January 10th.

The RAILWAY CHRONICLE may be ordered of any Newsvender price 6d. stamped. to go free by post.

GREAT WESTERN CHART.—The first of a Series of RAILWAY CHARTS, with hundreds of Illustrations, Topographical, Archæological, Mechanical, Architectural, &c., will appear in the RAILWAY CHRONICLE of January 24th.

The RAILWAY CHRONICLE may be ordered of any Newsvender price 6d. stamped, to go free by post.

TRAVELLERS' CHARTS for perusal on RAILWAYS.—A Series, with hundreds of Illustrations, will be COMMENCED in No. I. for 1846 of the RAILWAY CHRONICLE.

The RAILWAY CHRONICLE may be ordered of any Newsvender price 6d. stamped. to go free by post.

HORTICULTURAL IMPROVEMENTS.

J. READ begs to inform Ladies, Amateur, and Practical Gardeners, that he has just taken out a NEW PATENT for improvements in his Garden Engines, Machines, and Syringes for destroying those Animalculæ, which make such deadly havoc on all choice trees and plants. By these improvements, water may be thrown on the *under surface* of the leaves, or dispensed on choice plants in pots, &c. in form of a gentle shower or dew-fall; and the choicest flowers, fruit trees, Vines, &c. &c., may be watered without the slightest injury when in bloom. The valves are so constructed that they cannot get out of repair, which the Patentee from 31 years' experience can safely warrant. Manufactured only by the Patentee, 35, Regent Circus, Piccadilly, where they may be seen and proved.

N.B. None are genuine except stamped READ'S PATENT

MECHI'S NOVELTIES FOR NEW YEARS GIFTS.—The greatest variety for Ladies and Gentlemen at MECHI'S Manufactory and Emporium of Elegance, 4, Leadenhall-street, London, where may be suited the economist and the luxurious. Bagatelle Tables, 3l. 10s. to 15l. Writing Desks, 8s. to 20l. Dressing Cases, 15s. to 100l. Work Boxes, 5s. to 30l. Leather Writing Cases, 10s. to 7l. Ditto, with Dressing Case, 4l. to 25l. Tea Chests, 7s. 6d. to 8l. Envelope Cases, 4s. to 7l. Inkstands in Wood, Bronze, and Papier Mache, 4s. to 7l. Papier Mache Work Tables, 6l. 10s. to 25l. Tea Trays, 1l. to 34l. per set Work and Cake Baskets, 10s. to 4l. Card Racks, 16s. to 3l. Hand Screens, 10s. to 4l. 10s. Pole Screens, 2l. 8s. to 4l. 10s. Netting Boxes, Card Boxes, Ladies' Companions, Pearl, Shell, Papier Mache, and Leather), Ladies' Scent Cases and Toilet Bottles, Ladies' Card Case, Chess Boards and Men, Elegant Papier Mache Chess Tables, Gold and Silver Pencil Cases in every variety; good Tooth Brushes, 6d.; each, Cases of Plated and Silver Dessert Knives and Forks, Sheffield Plate, Splendid Table Cutlery, Warranted Razors and Strops, 3s. 6d. each, Sporting Knives, and every description of fancy cutlery. With a variety of other articles, of which Catalogues may be had Gratis. As MECHI manufactures extensively on his own premises, the quality of every article is warranted.

THE MOST IMMEDIATE REMEDY FOR COUGHS AND COLDS IS HOLLOWAY'S PILLS.—This celebrated and extraordinary Medicine is not only an effectual cure for Coughs, Colds, Hoarseness, or even Loss of voice, but is likewise a certain remedy in all cases of Wheezings, Shortness of Breath, and Asthmas. Any persons who may be so bad as not to be able to lay down in their beds lest they should be choked with Phlegm, may be radically cured by these Pills when every other means have failed, this latter class of sufferers may depend upon getting great relief in the first three days, and in ten days they will sleep almost as well as ever they did in their lives. Sold by all Medicine Vendors and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

CHRISTMAS AND NEW YEAR'S GIFTS.—The present season is hallowed by one of the most delightful offices of Friendship and Affection: the interchange of Gifts as remembrances of the donors, and tokens of their esteem for the receivers. The most appropriate present becomes the first subject of consideration; a merely useful one can afford no evidence of taste, while a present possessing no claims to utility, shows a want of judgment. To combine these requisites a more fitting souvenir cannot be suggested than

ROWLAND'S TOILET ARTICLES,

THE

"MACASSAR OIL," "KALYDOR," AND "ODONTO"

each of infallible attributes. In creating and sustaining the *luxuriant silken tresses*, ROWLAND'S MACASSAR OIL is highly and universally appreciated; ROWLAND'S KALYDOR is a preparation of unparalleled efficacy in improving and beautifying the Skin and Complexion; and ROWLAND'S ODONTO or PEARL DENTIFRICE, is invaluable for its beautifying and preservative effects on the Teeth and Gums.

The August Patronage conceded by our Gracious Queen, and the Several Sovereigns of Europe, and the confirmation by experience of the infallible efficacy of these *exalted personages' specifics*, have characterised them with perfection, and given them a celebrity unparalleled.

BEWARE OF SPURIOUS IMITATIONS.

☞ See that the word "ROWLAND'S" is on the Wrapper of each Article.

Sold by them at 20, Hatton-garden, London, and by Chemists and Perfumers.

THE EIDER DOWN QUILT is the warmest, the lightest, and the most elegant covering. It is suitable for either the bed, the couch, or the carriage, and from its extreme warmth is peculiarly adapted for invalids; also Goose Down Quilts, very comfortable, at half the price of Eider Down. Lists of prices of the above, and also every description of bedding, sent free by post on application to HEAL and SON, Bedding Manufacturers, 196, opposite the Chapel, Tottenham Court-road.

Printed by WILLIAM BRADBURY, of No. 6, York-place, Stoke Newington, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, December 27, 1845.

The Newspaper.

SATURDAY, JANUARY 4, 1845.

COUNTY FIRE OFFICE,
50, Regent Street, London, January 1, 1845.

The Directors of this Office beg to notify to all persons whose Renewals become due at Christmas that the 15 days allowed for payment expire on the 9th inst.

They take the present opportunity of informing the Public that *the Condition requiring the Certificate of the Minister and Churchwardens in cases of claims* has never been inserted in their Policies, and that it is their universal practice to indemnify parties suffering a loss by fire and insured in the County Fire Office, with promptitude and liberality.

J. A. Beaumont, Managing Director.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus; and B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices to 130, Fleet street.

News of the Week.

The commencement of the New Year is ushered in with a greater activity in Foreign politics than has been noticed for a considerable time. In France the year has opened with unusual bustle, and the note of preparation has been sounded for a sharp struggle for power. On the other side of the Atlantic the contending principles which have so long agitated the American republics, are rapidly advancing to a crisis, and the affairs of Europe are not likely to escape the influence of the changes which appear to be imminent in that quarter. The politics of France which gave the Ministry a week ago the prospect of a favourable Session, now threaten a disruption of the Cabinet; and an unexpected opposition which has sprung up at the very outset of the Session, has defeated them in those preliminary operations which afford no opportunity for an explanation of their views or for a defence of their policy. This opposition is explained only by the supposition that it is instigated by the Court, and it is therefore not surprising that the rumour of the day should attribute to the unpopularity of the Minister the cold reception given to the King at the opening of the Chambers. This fact, whatever may be its cause, is admitted by all parties, and the Opposition Journals declare that the King is not likely to forgive M. Guizot for an affront which is attributed to his Ministry. Count Molé, it is said, has had several interviews with His Majesty, and it is currently believed that he will soon become Prime Minister of France unless affairs take a speedy turn in favour of the present Cabinet. In addition to these causes of embarrassment, M. Villemain, the Minister of Public Instruction, has been struck with insanity under very distressing circumstances; and in the present state of things, the Government may find some difficulty in the appointment of his successor.—From the United States we have the message of President Tyler at the opening of Congress. This very lengthy document is important as the last act of a President who has supplied his country with more subjects of excitement, and has enjoyed less influence of a permanent character than any of his predecessors. Mr. Tyler, in this document—the last manifesto of his official career—enters at length into all the topics which constitute the staple of American messages. He touches with moderation on the questions still at issue with Great Britain, and gives some ground for hope that there are no very serious points which are not in a fair way of being settled. On the annexation of Texas, the Message is precisely what was expected—a repetition of all the arguments which Mr. Tyler had already so strongly urged in favour of the measure. But this incidental mention of the subject in a State document has less importance than the acts of the Executive. We learn from Mexico that the United States Minister at that Court has been instructed to use "strong language" to the Mexican Government, and that a correspondence has ensued on the annexation question, which has led to a suspension of diplomatic relations between the two Governments. A correspondence has been published in which the American Government openly avows its anxiety for the annexation of Texas on the ground that the independence of that country is a check to the continuance of slavery. The Mexican Government on their part, declare their determination to resist the annexation by force of arms; but internal commotions have occurred which threaten the Republic with a renewal of civil war. In the meantime, to add to the complication of affairs, the new President of Texas has given notice that unless Mexico agrees to a peace or armistice before December, he will at once assume the offensive with all the means he can command. From South America we have also tidings of a hostile character. The Peruvian fleet has been seized by two British frigates at Islay, for some insult to the British Consul, and the whole of the Argentine Squadron has been seized at Monte Video by the United States commodore. From Canada, however, we have advices of a peaceful nature. Sir C. Metcalfe opened the Parliament on the 29th Nov., with a speech praised for its moderation, and for its firm resolution to administer the Government according to the acknowledged principles of the provincial constitution. The election of Speaker took place immediately after the speech of the Governor-General, when Sir Allan M'Nab was elected by a majority of 3 over Mr. Morin, who is understood to represent a strong party in Lower Canada.

The Overland Mail from India has also arrived this week, with accounts from Calcutta to the 23d Nov., and from China to the 12th Oct. The news is not of a stirring character, the disturbed districts being tolerably quiet, and Sir H. Hardinge giving no indication of any other than a tranquil and pacific Government.

Home News.

Court.—The Queen and Prince Albert came to town on Friday, by a special train on the Great Western Railway, and in the evening honoured Drury-Lane Theatre with their presence. The Queen and Prince, with their suite, remained at Buckingham Palace until Saturday afternoon, when they returned to Windsor Castle. Previous to their departure, Prince Albert went to the Egyptian Hall, and inspected Captain Siborne's model of the Battle of Waterloo. On Sunday, the Queen and Court attended divine service in the private chapel of the Castle. On Monday and on Wednesday, Her Majesty and the Prince took a walk in the grounds, after which His Royal Highness shot in the royal preserves. On Wednesday evening, in honour of New Year's Day, Her Majesty's private band, assisted by the choir of Windsor and several musicians from London, performed a selection of sacred music by Hummel, Mendelssohn, &c., and a *Te Deum*, with full orchestral accompaniments, composed by Prince Albert. On Thursday, the Queen and Prince took equestrian exercise in the riding-school, and the Prince hunted with his harriers. Major-General Wemyss has succeeded Lord C. Wellesley as Equerry in Waiting on the Queen; and Colonel Bouverie has succeeded Major-General Sir E. Bowater as Equerry in Waiting on Prince Albert. The Earl of Warwick has succeeded Viscount Hawarden as Lord in Waiting; and Major-General Sir F. Stovin has succeeded Admiral Sir R. Otway as Groom in Waiting on Her Majesty.—The visitors to Her Majesty during the week have been the French Ambassador and the Countess de St. Aulaire, the Countess of Gainsborough, and Sir H. Wheatley.—A report is in circulation that the domestic circle of Her Majesty will probably receive another increase some time towards the end of the summer.—The visit of Her Majesty and Prince Albert to Stowe, the seat of the Duke of Buckingham, is fixed for Wednesday the 15th inst. On the following week the Royal party will honour the Duke of Wellington with their presence. It is not yet known whether the Queen will proceed by railroad to Wolverton, or travel the entire route along the high road to Buckingham. The Infant Royal Family will remain at the Castle during the short absence of the Queen, whose visit to Stowe will not be extended beyond Saturday the 18th.—A visit from the Queen and Prince Albert to the Grand Ducal Court of Saxe Coburg and Gotha is spoken of as likely to take place in the course of the ensuing summer.

Cabinet Council.—It is understood that the first Cabinet Council previous to the meeting of Parliament is appointed for the 9th inst. Sir R. Peel is expected to come to town from Drayton Manor on the 7th.

Parliamentary Movements.—The election for Dartmouth terminated on Friday in the return of Mr. Somes, the Conservative candidate, by a majority of 7. The numbers were—for Mr. Somes, 125; for Mr. Moffatt, 118. Immediately after the declaration of the poll, Mr. Moffatt stated that he would petition the House of Commons against Mr. Somes's return, on the ground that he was a Government contractor.—Mr. Hardy, Member for Bradford, has been seriously indisposed, and intends, it is said, to vacate his seat, at the commencement of next session. It is rumoured that Mr. Hardy's third son, Mr. Gathorne Hardy, barrister-at-law, will offer himself as a candidate, and that the free-traders contemplate starting Colonel Thompson, if a vacancy should be created.—In the event of a vacancy occurring at Horsham, it is understood to be the intention of Mr. Platt, Q.C., of the Home Circuit, to offer himself to the electors.—The Hon. Mr. Hutchinson, in consequence of the delicate state of his health, declines to accept the representation of Tipperary, which was offered him by the Repeal party. It is likely that Mr. Ryan, of Inchhouse, a deputy-lieutenant of that county, will now be selected.—A vacancy has occurred in the representation of Downpatrick, by the death of Mr. David Ker, which took place on Monday, at his seat in the county of Antrim.

Official Appointments.—The Queen has been pleased to appoint the Hon. Charles Augustus Murray, late Master of the Household, to be Secretary of Legation at the Court of Naples, and also to appoint him Extra Groom in Waiting to Her Majesty.—Her Majesty has been pleased to direct that letters patent be prepared for the appointment of Edward Smirke, Esq., to be Solicitor-General to his Royal Highness the Prince of Wales.

The Church.—The Queen has been pleased to appoint the Rev. Frederick Anson, brother of Mr. G. E. Anson, Treasurer to Prince Albert, to be Canon of Windsor, in the place of the late Hon. and Rev. R. B. Stopford.—The Rev. R. B. Paul, M.A., formerly Fellow of Exeter College, Oxford, has been presented to the perpetual Curacy of Kentish-town, by the Vicar of St. Pancras.—Under the provisions made by the Ecclesiastical Commission, the Archdeaconry of Cornwall, vacant by the death of Archdeacon Sheepshanks, will be divided. The Bishop of Exeter has appointed the Rev. Walter Gee Archdeacon of East Cornwall.

The Navy.—Vice-Admiral Sir W. Parker, Bart., is appointed to succeed Sir Edward Owen in the Mediterranean command, and will hoist his flag on board the Monarch, 84.—Vice-Admiral Sir F. W. Austen has been appointed to succeed Sir C. Adam in the West India and North America command, and will hoist his flag on board the Vindictive, 50.

New Polar Expedition.—It is stated that Government intend to send out another expedition to the Arctic regions, with the view of discovering the North-west passage between the Atlantic and Pacific. The Council of the Royal Society, having been solicited to give their opinion as to the desirableness of such an expedition, have stated that, independent of the great object to be attained, the benefits that would accrue to the sciences of geography and terrestrial magnetism render such an expedition peculiarly desirable. The command of the expedition, it is understood, has been offered to Sir James Ross; and should that Officer decline it, it will be offered to Sir John Franklin.

Death of Sir William Nott.—We regret to announce that Major-General Sir William Nott died on Wednesday last, the 1st inst. For some time past it had been deemed almost impossible that the General could recover, and, in fact, he has been lying in a state of insensibility for the last two or three days. The nature of the disease, an enlargement of the heart, precluded all probability of his existing for any lengthened period, although it was hoped that his native air would invigorate and enable him to live some years in the possession of his hard-earned honours. The severity of the weather, however, joined to the state of weakness to which he was reduced by the forced journeys he was compelled to take in order to reach Wales, and the excitement consequent upon the triumphal reception he met with at each town on his route, all contributed to weaken a constitution naturally strong, but which had been exposed to the numerous vicissitudes of an Indian climate. General Nott was born in 1786, at Neath, Glamorganshire, and was, consequently, in his 65th year.

Foreign.

France.—The Paris papers are chiefly occupied with the Ministerial crisis produced by the defeat of the Cabinet in the preliminary operations of the session, and before any opportunity has been given them of explaining the course they have pursued. The King's speech gave no indications of the approaching disruption, and all that has since occurred is attributed to the disappointment of the King at the reception of his speech by the Chambers, at the opening of the session. The speech, it appears, was received without enthusiasm, and many of those passages which were expected to prove effective, were listened to with a cold and unbroken silence. This unexpected circumstance has suggested various causes of discontent to the Opposition papers, which ill conceal their disappointment that the speech itself contained so few topics for controversy, while the supporters of government find nothing of so stirring a nature in it as to call forth any vehement expressions of their satisfaction. Upon the whole the speech, although acknowledged to be ably written, seems to have failed from being too tame for French taste. No doubt the friendly expressions with regard to the King's reception in England, unbalanced by any statement of political dissatisfaction in regard to the right of search, or the squabbles in Tahiti, have tended to exasperate the discontented, and to cool the ardent among French politicians. Even the *Débats* seems to admit that the Opposition are right as to the *fact* of no enthusiasm having been excited by the speech. That able Ministerial paper remarks that—"The Opposition say that the speech from the throne produced no enthusiasm. No. Affairs when well conducted, and a prosperous and a tranquil state of the country, excite no enthusiasm. The Ministers do not pretend to excite enthusiasm. They aspire to the peaceable approbation of sensible men." The Chamber of Deputies met on Friday, under the presidency of M. Sapey, the senior member. The President having drawn the names of the deputies composing the nine *bureaux* into which the assembly is divided, they retired into their respective standing committees to elect their chairmen and secretaries, and to examine the returns of the members elected since the last session. At 2 o'clock they re-entered the hall, and after some preliminary operations, proceeded to the election of the President for the ensuing session. The ballot gave—M. Sauzet, 164 votes; M. Dupin, 95; M. Odilion Barrot, 65, in a house of 331 votes. None of the candidates having obtained the absolute majority (one-half of the number that votes), a new ballot was opened, and terminated in the election of M. Sauzet, who obtained 177 votes, M. Dupin obtaining 129, and M. Barrot 15, and M. Berryer 1. The small majority by which the election of M. Sauzet was attained seems to have shaken the confidence of a portion of the public in the maintenance of the Cabinet. It was said in the Chamber that only two Ministers (MM. Guizot and Duchatel) were favourable to M. Sauzet, and that he would have lost his election but for the hostility of M. Dupin to the Church, which threw into the

scale in favour of his competitor the votes of the majority of the Legitimists. On Saturday the Chamber proceeded to the election of its four Vice-Presidents. The Ministerial candidates were MM. Bignon, De Salvandy, De Belleyme, and Le Pelletier d'Aulnay; the candidates of the Opposition were MM. Dufaure, Billault, de Sade, and de Tracy. The following is the result of the first ballot :—Number of votes, 303; Requisite majority, 152. M. Bignon, 172; M. de Salvandy, 172; M. Dufaure, 153; M. de Belleyme, 150; M. Billault, 146; M. Le Pelletier d'Aulnay, 113. The first three candidates having more than an absolute majority, were elected. A second ballot took place for the fourth Vice-President, but neither candidate having an absolute majority, the election was adjourned till Monday, when the Ministry succeeded in carrying their candidate, although the result was but very little better than a defeat, as they had summoned all their supporters. The number of voters was 340. Of these 172 voted for M. de Belleyme, the Ministerial candidate, and 168 for M. Billault, the candidate of the Opposition. This narrow majority was composed, it is said, of the four Ministers who have seats in the house, and who do not usually vote upon such occasions. Had they refrained from voting, the result would have been the other way. Private letters state, that this vote has completely deranged the Ministry, and come upon them by surprise. The friends of M. Guizot already attribute the result to the opposition of the Court, and say that all the people dependent on the King not only voted for the Opposition candidate, but canvassed actively for him. M. Molé is also said to have had several long interviews with His Majesty within the last two days. It would appear as if there were good grounds for the reports which have been for some time current that the King had complained of being deceived by M. Guizot in the matter of the dotation. It is also said that His Majesty will never forgive him the coldness of his reception at the opening of the session, "because," say the enemies of M. Guizot, "the unpopularity of the Minister was visited on the King!" The *Courrier Français* goes so far as to assert that, since the cold reception of his speech, Louis-Philippe has uttered the ungrateful sentence :—"Notwithstanding the services rendered me by poor Guizot, I must have a Ministry under whom *Vive le Roi!* shall be cried, and I may review the National Guard." Another event has just occurred to embarrass the Ministry, which is of a melancholy character. M. Villemain, the minister of Public Instruction, has been struck with insanity. In the fits of his complaint, he imagines himself persecuted by the Jesuits. He exclaims that his papers have been taken away by the priests, and that they have formed a plot against his life. It is said that the unhappy state to which M. Villemain has arrived has been brought about by excess of anxiety in official duties, and by severe domestic affliction. Last session the whole defence of the Government Bill respecting secondary instruction fell upon M. Villemain's shoulders. The opposition to the Bill was much more severe than was expected, and M. Villemain has frequently complained of the little support afforded him by his colleagues. This matter seems to have preyed upon his mind; and he has had the additional affliction of recently seeing his wife fall a victim to the same malady as himself. She is now the inmate of a lunatic asylum. M. Villemain has a family of three young children, to whom he was devoted, and who are thus not unlikely to be deprived of the care of both parents. This unhappy combination of circumstances tends to show that the Ministry are in a perilous position; and if it be true that the Court has turned against them, the days of the Cabinet are doubtless numbered, and Count Molé may soon be Prime Minister of France. The proceedings of the Chamber of Peers are but slightly noticed by the journals, the struggle for office being fought chiefly in the other Chamber. The Peers, however, on Friday, appointed the committee to draw up the address of the Chamber, in answer to the speech. Count Molé made a violent attack on the Government respecting its policy in general, but especially with regard to Morocco.—The Brest Papers of the 26th announce the arrival in that port of the Reine Blanche frigate, bearing the flag of Admiral Dupetit Thouars, having on board the Princess Januaria, sister of the Emperor of Brazil, and her husband, the Count d'Aquila, and their suite. Admiral Grivel went on board immediately to pay his respects to the Princess, and brought her Royal Highness and the Count d'Aquila on shore. The Reine Blanche left Rio on the 24th of October. The Count d'Aquila, his consort, Princess Januaria, and Admiral Dupetit Thouars were expected at Paris on Monday, where their Royal Highnesses were to occupy the apartments at the Tuileries recently occupied by the King and Queen of the Belgians, who left Paris for Brussels on Monday.—By the arrival of the Reine Blanche, accounts have been received from Tahiti to the 14th July. Numbers of the *Océanie Française*, which have come to hand by this arrival, contain very long details of the state of affairs in that quarter, and official reports of the combats mentioned in the last accounts. The last number of the *Océanie* has the following :—"At the moment of going to press, her Britannic Majesty's sloop of war Carysfort, Captain Lord Paulet, appeared off the ridge which closes in the roadstead of Papeiti, and, without entering, saluted the flag of our commander, which was returned by the Uranie. At the same time the Governor received a visit from Lord Paulet. The Carysfort brings private letters from France, which come *viâ* Panama, with dates up to February 26th, but no despatches for the Governor, nor a single journal. The Governor has only received a letter from an officer, who commands one of Louis-Philippe's ships in the South Seas, announcing that a French journal which had reached Valparaiso, gave intelligence that the whaler Elizabeth, which left Tahiti within the first fortnight in November in last year, carrying despatches, informing the Government of the motives which forced Admiral Dupetit Thouars to convert the protectorate of Tahiti into an absolute possession of the island, had made her passage to Havre in ninety-five days. The same journal, of the date of Feb. 29, says that, after the reception of the despatches we have mentioned, his Majesty declared that he could not accept the full possession, but must adhere to the protectorate. We repeat that the Governor has not received any official despatches, but nevertheless, on reading the letter sent to him from Valparaiso, he hastened to send the chief of his staff on board the Basilisk, with a letter to Queen Pomaré, acquainting her with the state of affairs, and inviting her to come on shore. This letter was interpreted to Queen Pomaré in the presence of the bearer, and the captains of the Carysfort and Basilisk. Pomaré replied, that she determined not to land, but would go to Borabora, and there wait the conclusion of the affair." The *Océanie* of July 7 contains a long summary of the recent expeditions against the insurgents, and gives the report of Captain Bonard, of the Uranie, stating minutely the whole of his proceedings in the affair of Ponnavia, but these documents contain little that would interest our readers. The *Presse*, however, publishes the following characteristic account of the state of affairs in Tahiti, dated Papeete, July 14 :—"We are in a most critical position. The manœuvres of the English have at length attained their object. There is no longer any security for the lives or properties of the French established in this colony. The French population of Papeete would have been entirely massacred on the 30th of June, if the providential return of a part of our forces had not preserved them. We are completely discouraged, and, notwithstanding the incomparable firmness of our Governor, all eyes are turned to the ships in the roads, as the last hope of our countrymen. This state of affairs is due to the English, who excite the savages, supply them with ammunition, and direct their attacks. But it is likewise the result of accounts received at Tahiti, by private correspondence, of the refusal of the King of the French to acknowledge the possession of this island. Nothing can equal our dejection, except the insolent joy of the English. This is the fruit of our heroic efforts! This is what we have obtained for the blood of 117 of our soldiers, with which the earth has been moistened!"

SPAIN.—We have accounts from Madrid to the 25th inst. The Minister for Foreign Affairs on the 23d presented to the Senate a most important bill relative to the treaty concluded between Great Britain and Spain in 1835, for the abolition of the slave trade. By this measure, offences connected with the slave trade are rendered penal—a point which, ever since the signature of the treaty, it has been the constant object of English Ministers to obtain from Spain. The Assembly afterwards resumed the discussion of the fourth article of the Reform Bill, which presented no interest, and adjourned to the 28th. In the Chamber of Deputies the debate again turned on the amendments proposed to the Dotation Bill by the Marquis de Viluma. After some discussion respecting the nature of those amendments, it was decided by 78 votes against 41 that they should not be considered as amendments, but as distinct projects of law, intended to supersede the Ministerial Bill. M. Reinosa then moved that these amendments be referred to a committee, and that the House should suspend its deliberations until a report be submitted to it by that committee. The Assembly, however, rejected the proposition, and adjourned till after the Christmas holidays. It appears that 17 deputies had imitated the example of the Marquis de Viluma, and resigned their seats. Among them were several Spanish grandees. The President was preparing to read the letters he had received from them at the beginning of the sitting, but M. Martinez de la Rosa prevailed upon him not to do so. The Senate was engaged on the 24th in the discussion of an amendment moved by the Duke de Gor, on the Constitutional Reform Bill, the object of which is the establishment of a hereditary peerage. The question was, however, ultimately adjourned till after the holidays. It is supposed that the Marquis de Viluma and the seventeen deputies who have resigned their seats in the Cortes, will withdraw their resignations.

GERMANY.—The German papers say that it is proposed to establish entrepôts at Antwerp, Amsterdam, Bremen, Hamburg, and Trieste, for the accommodation of the commerce of the German Customs Union. The receipts of the Zollverein during the first nine months of 1844 were 18,889,542 thalers, or 1,221,765 more than in the corresponding period of 1843.—The King of Hanover, says a German journal, has ordered that a monument similar to that of Queen Louisa of Prussia, and which will cost 200,000 thalers, shall be erected in honour of his late Queen, in front of the Palace of Herrenhausen, near his capital.—Letters from Hamburg give long accounts of Mr. Solomon Heine the wealthy banker, who died in that city on the 23d ult., aged 78.—The Roman Catholic priest, John Ronge, in Upper Silesia, who was lately excommunicated for having written his celebrated letter to the Bishop of Trèves, in which he denounced the late exhibition of the holy garment, has addressed a pamphlet to the lower orders of the Roman clergy, calling upon them to unite their exertions with him, in the pulpit and in the confessional chair, against the Ultramontanists and the Bishop of Rome, in order to found, by council and synod, a national German Catholic Church, independent of Roman darkness. He wants to abolish auricular confession, the celebration of mass in Latin, the making of proselytes by money, the stultification of the lower clergy by the commands of the higher hierarchy, and at the same time he asks for liberty to think and to investigate for every clergyman, and permission to marry for all priests. The police have seized the pamphlet. The progress of dissent, however, is apparent in other parts. The priest Czerski, who stands at the head of a small German Catholic community in Schneidemuhl, in Prussia, distributes the holy supper in both forms, without auricular confession, and reads the mass according to the recognised Roman rule, but in German, and omitting what refers to the saints and their intercession. In Bromberg the excitement in favour of the new German Catholic Church is very great, and from Konigsberg an address has been sent to Czerski, signed by 43 of the most influential men in East and West Prussia, including several professors of the University, the chaplain of the garrison, teachers and directors of schools, and several members of the upper law courts.

ITALY.—A letter from Messina, dated the 30th ult., mentions that the King of the Two Sicilies has made the following reductions in the quarantine department :—1. Vessels arriving from Constantinople, if furnished with a clean bill of health, and a consular certificate, will perform 14 days' quarantine, instead of 21, as formerly. 2. Vessels from Algiers (the country) will perform seven days, provided no goods from the interior of that regency be on board. 3. Vessels from the port of Algiers, from ports of Russia, the Black Sea, and Azof, will be admitted to free pratique, when furnished with the consular certificate as above. 4. Restrictions for shipping goods in America, except the Antilles and Mississippi, are entirely abolished. 5. Restrictions on all vessels coming from Spain, Portugal, the Balearic Isles, and Gibraltar are also abolished. 6. The quarantine on vessels coming from Tangiers, Tunis, Greece, and the Ionian Islands, having been imposed by foreign power, no alteration has been deemed necessary by His Sicilian Majesty in this respect.—Letters from Florence mention an occurrence which is scarcely credible. The Countess Z——, of St. Petersburgh, who is known for the many *male* enmities she has kindled, and seems to delight in, had just entered her carriage in order to go to the promenade, the horses were about to start, when perceiving that she had forgotten something at home, she descended, and re-entered her residence; but she had scarcely passed the door when a tremendous explosion blew the carriage to pieces, and killed the coachman. An infernal machine had been introduced into the body of the carriage. This horrible attempt is imputed to a young man who had sworn to be conspicuously revenged on the celebrated Countess. The corpse of the poor coachman was removed by the Brothers of Mercy.

HOLLAND.—The Hague was lighted by gas, for the first time, a few days ago. The journals of that place state that the gas-works, although on a very extensive scale, and combining all the most useful improvements which have been introduced into the manufacture of gas, were executed in the almost incredibly short space of five months, including the laying down of twenty-five miles of pipes.

RUSSIA.—The *Breslau Gazette* says that the Russian Government Commission established at Peysem, a town situated on the Prussian frontier, has discovered a new conspiracy among the high Russian nobility, the ramifications of which extend to the Caucasus. A great number of arrests continue to be made, especially among the public functionaries. Several gentlemen have been placed in chains for being found in possession of prohibited books. Most of the prisoners are sent at once to the mines of Ural.

TURKEY AND EGYPT.—Accounts from Constantinople of the 17th ult., announce that on the 9th one of the Sultanas was confined of a Princess, to whom the name of Munire (Brilliant) was given. The Hasnè Vekili, Arif Pasha, proceeded to the Sublime Porte to announce to the Grand Vizier the happy event. The birth of the Princess was celebrated with public rejoicings. It is stated that full satisfaction would be given to the British Consul at Trebizond for the insult offered him by the Pasha, and that the Porte had consented to liquidate the claims of Sir B. Walker. Other measures were about to be taken by Sir S. Canning, in conjunction with the Ambassadors of France and Russia, to obtain redress and compensation for the cruelty inflicted on the Greek at Trebizond. Dr. Wolff was on his way from Teheran to Erzeroum, according to the latest accounts.—From Alexandria, we learn that Mr. Bourne's Postal Convention with the Pasha has been concluded, and will be sent to England by the steamer Oriental to be ratified. The conditions are not so satisfactory as expected. Although the particulars of the agreement have not been made public, it is believed that it is based on the same principles as the one made with the French Government for the India mails proceeding through France, and that Mehemet Ali will receive an amount of postage on the mails passing through Egypt to and from India, at the rate of 6s. per lb. on letters, and 1s. per lb. on newspapers. The term is for five years. The mails will be conveyed through the country by the Viceroy at his own expense, and will be accompanied by an English messenger.—On the 28th Nov. the dry dock was opened, and the steamer Nile, of 220-horse power hauled in, being the first vessel that entered it. This proceeding was effected with great cere-

mony, amidst the din of artillery and the volleys of a great number of troops placed along the quays. The ships in the harbour were dressed, and the Pasha, who arrived from Cairo on the 26th for the purpose, was present, attended by a numerous staff and the several European Consuls. At night the fleet and town were brilliantly illuminated. It is said, that M. Mongel, the engineer of the dock, has received from Mehemet Ali instructions to take the necessary measures for the construction of the "barage" of the Nile, which, if completed, will be a great boon to Egypt. The site fixed upon, at present, for this purpose is the point of ramification of the Rosetta and Damietta branches of the river, about 10 miles below Cairo. It will consist of two bridges, one over each branch of the Nile, both joining at the extreme point of the Delta. The bridges will be formed of a certain number of arches, and one arch of each bridge will be made with a lock, for the purpose of navigation. In the centre of the Delta and on the sides of the bridges will be opened several canals, to which the water of the Nile will be allowed ingress as it may be required. It is also said that Mr. Galloway, the engineer, has been sent for by the Pasha, to commence the railway across the desert, projected by his brother, the Bey, ten years ago.—Letters from Jerusalem in the German papers state, that the Protestant bishop of that city has received full permission from the Sultan to build an evangelical church on Mount Sion, and that the work of conversion is making great progress.

India and China.—The Overland Mail reached town yesterday morning with accounts from China to the 12th Oct.; Bombay, Dec. 2; and Calcutta, to Nov. 23. It appears from the Indian papers that the past month has not been prolific in events of a stirring character. The insurrection in the Kolapore country, which proved to be of a more serious character than was supposed, has been put down, and the disturbed districts seem to be tolerably quiet. The Governor-General is still at Calcutta, and rumour is silent on the subject of any intended move from the seat of Government. He appears to be quietly perfecting himself in the business of his administration; and such indications as have yet been manifested seem to point to a tranquil and pacific Government. There is no talk of a war in the Punjaub, or any other immediate employment of our troops. Even the civil war which many anticipated, in that long-agitated country, seems to be no longer imminent. Sawum Mull, the Governor of Moultan, one of the most able and energetic, and, at the same time, the most moderate and respectable of the Seikh Chiefs, had been shot by a malefactor, whilst sitting on the judgment seat, and after lingering for a few days died of his wound. He has been succeeded by his son Mool Raj. The intelligence from Affghanistan is as usual not very clear; but it would seem that the dangers which Dost Mahomed apprehended from the designs of the Usbegs and Tartars are at an end; that his successes on the Hindoo Koosh have rolled back the tide of invasion, and that the intrigues of Bokhara have been defeated. At Calcutta, two domestic events have occasioned some interest of a painful character. One of these is the suicide of the Rajah of Berhampore, who having committed through his instruments some acts of cruelty on the person of a dependant, which occasioned in the sequel the poor man's death, came down to Calcutta, where intelligence of the tragic issue reached him, coupled with the information that a warrant was out for his arrest. Dreading the indignity of falling into the hands of the police, he blew out his brains. He had previously made a will, leaving the bulk of his large property to be devoted to the establishment and support of a University. The Jury brought in a verdict of *Felo de se*. The other event is the murder, by Dakoits, of Captain Alcock, of the Quartermaster-General's Department, who was intercepted, when on a dawk journey, by a band of notorious Dakoits, of whom the police were in pursuit, and being taken for Mr. Unwin, the magistrate, was dragged from his palanquin and cut to pieces. Several of the men concerned in the murder have been apprehended. Such events are of rare occurrence, and the present one has therefore created a very great sensation.—The accounts from China are not important. Letters from Hong-kong to the 3d Sept., state that a severe typhoon was reported as having occurred at Chusan, in which the barque Cornwall was totally lost, and the Mary Ann Webb dismasted. We have also advices from Sydney to the 4th September, which are probably later than any which will have reached England before the arrival of the present mail. The colonies were very slowly reviving. Great distress prevailed among the operative classes, and a public meeting had been held to memorialise the Government to take their case into consideration.

United States.—By the royal mail steamer Caledonia, which arrived at Liverpool on Sunday, we have accounts from New York to the 15th ult. These advices are of great interest, since they contain not only the message of the President of the United States to Congress, but also most important news from Mexico, together with the speech of the Governor-General of Canada on the opening of the Parliament at Montreal. President Tyler's State message is a very lengthy document, occupying upwards of four columns of the papers. After an exordium devoted to the institutions of the country, and an exposition of the views of the Democratic party on various matters of local interest, Mr. Tyler adverts to topics more immediately concerning this side of the Atlantic. He states that they continue on the most friendly terms with all the Powers of Europe, which he describes as "that enlightened and important quarter of the globe." On the Oregon question he regrets that American law had not been extended and declared prevalent there, and recommends the establishment of posts to guide and protect emigrants and travellers in that direction. He says it will afford him the greatest pleasure to witness a happy and favourable termination to the existing negotiation, upon terms compatible with the public honour; and the best efforts of the Government will continue to be directed to this end. In regard to other questions pending with this country he says, that delays have occurred which are still a cause of embarrassment. "It is true," he says, "that, in a pecuniary point of view, the matters alluded to are altogether insignificant in amount, when compared with the ample resources of that great nation; but they, nevertheless, more particularly that limited class which arise under seizures and detentions of American ships on the coast of Africa, upon the mistaken supposition, indulged in at the time the wrong was committed, of their being engaged in the slave-trade—deeply affect the sensibilities of this Government and people. Great Britain, having recognised her responsibility to repair all such wrongs, by her action in other cases, leaves nothing to be regretted upon the subject, as to all cases prior to the treaty of Washington, but the delay in making suitable reparation in such of them as fall plainly within the principle of others, which she has long since adjusted. The injury inflicted by delays in the settlement of these claims falls with severity upon the individual claimants, and makes a strong appeal to her magnanimity and sense of justice for a speedy settlement. Other matters, arising out of the construction of existing treaties, also remain unadjusted, and will continue to be urged upon her attention. The labours of the joint commission appointed by the two Governments to run the dividing line, established by the treaty of Washington, were unfortunately much delayed in the commencement of the season, by the failure of Congress, at its last session, to make a timely appropriation of funds to meet the expenses of the American party, and by other causes. The United States commissioner, however, expresses his expectation that, by increased diligence and energy, the party will be able to make up for lost time." In regard to Texas, the message is precisely what was anticipated, a strong repetition of former arguments in favour of annexation. Mr. Tyler concentrates his force upon this question, of which, if the solution be not imminent, at least it cannot be for a great length of time deferred. He appends to his message a great number of documents on this point, and asserts that the mere fact of Texas having proposed to join the American Union ought to have deterred Mexico from hostilities. The message touches lightly on the Tariff, stating merely in unison with the principle of the Locofoco party, that "greater taxes should not be levied than are necessary for an economical administration of government, and that whatever exists beyond should be reduced or modified." The remainder is occupied, after a brief statement of the improved financial condition of the Union, with recommendations for the improvement of the army, the ordnance department and fortifications of the coast, the navy yards, and especially the creation of a steam navy, and of steam-packets, commanded by American officers, for the conveyance of mails to Europe. It concludes by saying, "I shall most gladly leave to others more able than myself, the noble and pleasing task of sustaining the public prosperity. I shall carry with me into retirement the gratifying reflection that, as my sole object throughout has been to advance the public good, I may not entirely have failed in accomplishing it; and this gratification is heightened in no small degree by the fact that when, under a deep and abiding sense of duty, I have found myself constrained to resort to the qualified veto, it has neither been followed by disapproval on the part of the people, nor weakened in any degree their attachment to that great Conservative feature of our government."—The anterior proceedings of Congress are interesting. In the Senate, on the 3d, Mr. M'Dufie introduced a joint resolution for the annexation of Texas to the United States. The resolution provides that the first eight articles of the treaty rejected by the Senate last session shall be the fundamental law of union between the United States and Texas, as soon as the supreme authorities of that Republic shall agree to the same; and, also, that whatever was stipulated to be done immediately, or at a fixed period after the ratification of the treaty compact, shall be done immediately, or in a like period after the authorities of Texas shall have formally agreed to the resolution. It was referred to the Committee on Foreign Relations. A similar joint resolution was also reported in the House. On the following day Mr. Benton introduced his bill of last session, providing for the "re-annexation of Texas;" and this was also referred to the Committee on Foreign Relations. On the same day a resolution, introduced by Mr. Allen, calling upon the President of the United States for information concerning the state of the negotiations pending on the Oregon questions was, after some opposition, adopted by a vote of 24 to 16. Another resolution, calling upon the President, if not incompatible with the public interest, for copies of all correspondence between France and the American Minister at Paris, relative to the proposed annexation, was adopted.—By the same mail we have a mass of official documents connected with the question of annexation. It appears that during the past spring and autumn an active and exceedingly lengthy correspondence has been taking place between the United States, Mexico, Texas, France, and no doubt England, with respect to annexation; the most important facts disclosed by which are, that, in pursuance of instructions received from Mr. Calhoun to "use strong language," Mr. Shannon, the United States Minister to Mexico at once proceeded to do so, by protesting "in the most solemn form" against the invasion of Texas and against the manner in which Mexico was acting towards that country in regard of General Woll's order of June last. Mr. Shannon, in his protest, says that the honour of his country is implicated in the matter, and that if Mexico is offended, it is the United States that is the offender, as having first proposed annexation to Texas. He then accuses the Government of Mexico of contemplated atrocities, of being barbarous violators of the laws of nations and of humanity, as deluding themselves by fictions, and as having proclaimed a bloody and barbarous plan of invasion against Texas, "highly injurious and offensive to the United States." In reply to this the Mexican Secretary of State (Senor Rejon) maintains the right of Mexico to Texas, as a part of her empire, complains of the exceedingly offensive language of Mr. Shannon's letter, and while professing to hold the friendship of the United States in very high estimation, alludes to bad faith, &c. He then declares that Mexico will not tamely submit to the seizure of one of her provinces, and hints that, if there be trouble, it will be the fault of the United States, and not of Mexico. This Mr. Shannon declares to be most insolent language, and such as he will not permit to be used towards his Government. He peremptorily demands that it be recalled, and that at once. He says that he is just sending home, and everything depends upon what he shall have to report. S. Rejon's rejoinder was manly and direct. He thought one who used such language as that of Mr. Shannon should not talk of courtesy to others; tells him that their Governments did not clothe them with diplomatic powers for the purpose of picking quarrels, &c., and declines to withdraw the note. According to the accounts Mr. Shannon had suspended diplomatic relations with Mexico, but the reports want confirmation. The remainder of the correspondence referred to above shows that Texas, alarmed by the threats of an invasion by Mexico, applied to the United States Government for the fulfilment of Mr. Murphy's pledge of military assistance and protection, which, it may be remembered, Mr. Murphy was rebuked for giving, as beyond his authority. This fact was adverted to in the reply to the application, which declined rendering the assistance, on the ground that the promise was to be in force only while the treaty was pending; and as the treaty had fallen through, by the refusal of the Senate to ratify, the promise had fallen with it. The Mexican Congress had unanimously voted an approval of S. Rejon's replies to Mr Shannon. This intelligence comes strangely with the announcement of a revolution in Mexico, where the power of Santa Anna was threatened. Nearly one-half of the Mexican army had revolted, and declared against Santa Anna, if the reports are correct. The Government were put to the greatest trouble to obtain money to prosecute the war against Texas, and everything was in confusion. It was thought, however, that Santa Anna, in consequence of the impending war, might be able, by obtaining command of the purse, to keep possession of the sword of State. The British Minister is said to be in favour of such a result. Meantime, Gen. Paredes has placed himself at the head of a revolt, and has publicly denounced Santa Anna, complaining of the disorganisation of the army, the abuses of the Treasury department, the disorder existing in the public offices, alleged breaches of law and violations of right on the part of the Dictator, and the invasion of Texas, not on the score of right on the part of the Texians, but on that of the mismanagement of the proceedings against that province. The most important intelligence from Texas is comprised in a declaration by the new President, Anson Jones, informing the Foreign powers friendly to Texas, "that if peace or a satisfactory armistice is not concluded before the annual meeting of Congress, in December next, or unless Mexico is informed by them, previous to that time, that she must confine herself to the west side of the Rio Grande, Texas will immediately assume an offensive attitude with all the means which she can command, and she will not feel restrained from the employment of auxiliary aid in the prosecution of the war."

Canada.—The Canadian Parliament was opened on the 20th Nov. by Sir C. Metcalfe, in a speech which shows that he has a majority in the House of Assembly. After adverting to matters of local interest, viz., advancement of education, formation of new roads, regulation of the militia law, improvement of the finances, and proposed provision for a civil list, his Excellency concludes by saying, "You will, I am sure, concur with me in desiring that the welfare of United Canada may be promoted by our joint labours. To that great end I invite your earnest efforts, and you may be assured of my hearty co-operation in every measure that may be calculated to secure peace and prosperity, justice and happiness to this province. The charge intrusted to me by our Sovereign I shall continue to administer according to the acknowledged principles of our provincial constitution, and with a view to the wants and wishes of the community. On the occurrence of vacancies in several of the most important offices of administration, I immediately endeavoured to fill them by the appointment of gentlemen supposed to possess the confidence of the people. Extraordinary obstacles produced a delay in the accomplishment of that purpose, notwithstanding my incessant exertions to effect it. Confidently believing that the several branches of the legislature in the full exercise of their constitutional powers will maintain the harmony essential to the well being of the people for whose benefit alone these powers are conferred, I will not detain you from the important duties which await you further than to

express my humble hope, that the Almighty may bless our endeavours and render them efficacious for the public good." After the speech the members of the Lower House proceeded to the election of a Speaker, when Sir Allan M'Nab was elected by a majority of three over Mr. Morin, who was supported chiefly by members from Lower Canada.

SOUTH AMERICA.—Letters from Buenos Ayres, dated Oct, 2, state that circumstances of an extraordinary nature took place at Monte Video on the 29th Sept., being nothing less than the seizure by the American commodore, commanding the United States frigate Congress, of the whole of the Argentine squadron. It appears that some Buenos Ayres vessels of war had interfered with some American trading vessels, and had fired into the United States vessel Bainbridge. Upon this Commodore Voorhies, of the United States frigate Congress, took possession of the entire blockading squadron belonging to Buenos Ayres. Captain Newman, commander of the Bainbridge, is said to have drowned himself in consequence of a reprimand from his superior officer, for not having returned the fire. On the same day a sortie was made from Monte Video, under the command of Flores, who succeeded in surprising a party of Oribe's men, slew about 60 of them, and carried off a quantity of cattle and horses, which were driven into the town.—We have accounts from Lima to August 20. The country was in confusion. Callao was preparing with 3000 men for defence against Castelli and his army of 5000, but would probably have to surrender. President Vivanco, who had had a battle with General Castelli and been beaten, and his troops dispersed, had arrived at Callao with some of his followers in a steamer. He was not permitted to land, but was ordered to Islay. The British frigates, Talbot and Dublin, had taken charge of the whole Peruvian fleet at Islay, as they had fired into the British Consul's house at that place. The fleet had previously deserted, and given itself up to General Castelli.

CITY.

Money Market, Friday.—Consols for the account closed at 100⅞; Red. Three per Cents., 100⅞; New Three and a Quarter per Cents., 103⅞; Exchequer Bills, 63 to 65 pm.; India Bonds, 78 pm.

GAZETTE OF THE WEEK—BANKRUPTS—G. BARTLETT, Wellington-street, Goswell-street, plaster manufacturer—W. E. GOULD, Finsbury-place South, carver—F. DUDLEY, Rochford, Essex, builder—J. TAYLOR, Market-street, Mayfair, carpenter—R. ELDRIDGE, Bletchingley, Surrey, innkeeper—T. W. BURFORD, Brydges-street, Covent Garden, victualler—E. S. A. FINDLAY, Grafton street, Fitzroy-square, milliner—G. E. LANHAM, Southampton, builder—J. WAIGHTMAN, Cotton End, Northampton, wharfinger—B. W. PALMER, Daventry, wine merchant—A. PADBURY, jun., Epsom, Surrey, grocer—J. NEWBOLD, Nottingham, tailor—J. WARD, Manchester, engineer—J. WOODHEAD, Todmorden, Yorkshire, clogger.

BANKRUPTCY ANNULLED.—J. C. WHITE, Canterbury, draper.

SCOTCH SEQUESTRATIONS.—A. RANKIN, Grahamshill, ironstone contractor—J. MACLENNAN, Bonar-bridge, timber merchant.

Metropolis and its Vicinity.

The late Bank Robbery.—The daily papers have received a communication from Messrs. Rogers and Co., stating that on the night following the robbery committed on their premises, Mr. Hobler despatched his principal clerk to the Continent, to stop the circulation of the stolen notes, and that the clerk has just returned, after having visited the chief commercial cities of France, Belgium, Holland, and Germany, in all of which the various bankers, money-changers, tavern-keepers, and traders have been served with notices, legally authenticated, so as to render any one of them "who," as it is said, "might unfortunately change a note" personally liable for the loss of the amount. The gentleman sent out by Mr. Hobler was Mr. Justin. While on the Continent, in looking over the foreign journals, he read a paragraph in one of the Frankfort papers, stating that one of the stolen notes had been offered for change at Hamburgh by an English navigator. Mr. Justin instantly started for that city, where he was informed that the man who attempted to negotiate the note was one of the navigators in the employ of Mr. Mundy, of Abchurch-lane, who was then at Hamburgh superintending the construction of the city sewers. The account was, that the note was offered to a Jew, who at once sent for Mr. Mundy, that that gentleman caused the house of the man to be searched, when between 3000*l.* and 4000*l.* of the stolen notes were found secreted, and that Mr. Mundy had confined him in a sewer until some person empowered to take him into custody should arrive from England. Hearing this account from different sources, Mr. Justin, with the police, visited that part of the city in which the offender was said to be confined in the sewer, and saw Mr. Mundy, from whom he learned that there was not a word of truth in the rumour, although the tale of the bill being offered, the discovery of the 4000*l.*, and his confining the man in the sewer, was the subject of general conversation. Finding the whole to be a hoax, Mr. Justin commenced retracing his steps, when Mr. Mundy also being about to return home, they set out together. The Elbe being frozen over, it was necessary to travel in sledges. To the surprise of both parties those portions of the city through which they had to pass, were densely crowded by people of all ranks, a report having got into circulation that Mr. Justin was an English officer, and that he was returning with the person who had committed the great robbery at the rich English banker's, and that it was to catch a glimpse of so renowned a thief that the public curiosity was excited. It has been ascertained beyond a doubt that none of the stolen notes have been even offered for circulation in any of those places through hich Mr. Justin travelled.

The House of Correction.—A protracted inquiry connected with the discipline of this prison has been going on for some days before Mr. Wakley, in the course of an inquest on the body of a prisoner called Hodges. The main evidence stated that deceased had been received into that prison, after being sentenced at the Central Criminal Court on the 28th August last, to six months' imprisonment and hard labour. He frequently complained, after becoming an inmate, of ailments, and particularly of colds. On the 12th Oct. he complained of severe pains in his back, was taken from the wheel in consequence, and put to oakum picking. In November he again complained of being ill, and left the tread-wheel on which he had again been placed, to inform the surgeon of the fact. For this he was punished by being deprived of half his usual quantity of breakfast, and again was sent back to the wheel. On the 3d December he was attacked with serious illness, which terminated in his death. It appeared from the evidence of another prisoner who had been in the same yard with deceased, that the cell in which deceased had slept at night was an extremely cold one; that he had himself slept in it, and consequently was in a condition to state the fact; that the prison diet did not allow a sufficient quantity of sustenance for the maintenance of health and warmth in the body during the winter months. It was also stated that if a prisoner made a complaint to the surgeon of the gaol that he was ill, and the latter thought he was not so, that he was punished by being deprived of half his meal, and if it happened to be on one of the meat days, then that meat would be taken from him, and he would be put upon gruel. The effect of this system was to deter prisoners when they were ill frequently from making the complaint of their being unwell, and especially if that visitation should chance to be on a meat day. It was also stated that the rules forbidding prisoners to speak were so rigidly observed, that men had been punished for talking in their sleep; and one deposed that in order to guard against this he always made a practice of tying a handkerchief round his mouth when he went to bed. The chief allegations, however, against the prison were on the score of deficient food. The witnesses stated that they were always hungry, and lost weight after being in the prison for a few weeks. A long discussion took place relative to the loss of weight which several prisoners had stated they had undergone since their admission into the prison. The book in which the weights of the prisoners are registered was produced, and it was found that almost all had been considerably reduced, some having lost as much as 1½ and 2 stones each. Some statements were also made on the punishment inflicted for the use or introduction of books, but the visiting justices who were present during the inquiry, explained the necessity of strictness on this point, as robberies were often planned by means of books passing from one prisoner to another. Mr. E. Wilson, lecturer at University College, deposed that he had made a *post mortem* examination of deceased's body, and showed that the immediate cause of death was pleurisy, complicated with inflammation of the lungs. Three causes might be assigned for death—namely, mental depression, cold and insufficiency of food. Under mental depression the deceased evidently laboured. With respect to cold, he did not think he suffered much. He was, however, compelled to express his belief, judging from the evidence he had heard, and the dietary table of the prison, that the quantity of food allowed to the prisoners is insufficient, more especially at this season of the year. The kind of food, too, might be improved. There should be more oil, in the shape of butter, and more sugar or molasses. He would also strongly recommend pea-soup to be introduced, as it has been proved by Liebig, and other modern chemists, that peas contain a large quantity of nitrogen, and are, therefore, an excellent food. The coroner summed up, and the jury returned a verdict, "Died from natural causes. At the same time, we beg to express our opinion that the officers of the institution are exonerated from the charges that have been made against them. We agree entirely with the views of Mr. Erasmus Wilson, and trust that as far as possible his suggestions may be carried into effect." The jury conveyed a vote of thanks to the visiting justices, and Mr. Pownall stated that they would at once retire to the magistrates' room, and discuss the evidence which had been adduced.

The Barking Fishing Smacks.—We lately noticed some of the grievances of the Barking fishermen, and the strike which took place in order to obtain redress. It appears, from an inquest held on Friday at Greenwich, that the apprentices on board the smacks are subjected to cruelties and neglect which the coroner described as a disgrace to a civilised country. The inquest was held on a lad named Morgan, who had been apprenticed by the Marine Society to a smack-owner called Smith. The smack had been at sea for a month, fishing on the coast of Holland. The lad had been cruelly beaten by the master, and kept without victuals sometimes for an entire day. He had, like the other apprentices, suffered dreadfully from the cold during the late severe weather, and had no bed of any kind to sleep on, and from want of covering they were always obliged to sleep in their clothes. The boys, on the return of the smack to Barking, were taken on board the Dreadnought hospital ship, where deceased soon died from congestion, aggravated by ill-treatment; the other apprentice had been severely frost-bitten and neglected, and the surgeon stated that he would lose some of his toes. The owner, Smith, stated that he had discharged the master of the smack. The Coroner, however, told him, that he would be made answerable for the lives of the poor boys. Dogs in a stable, he said, were treated with more humanity than his apprentices had been. The boys were not to be murdered, and the public told by those who were bound to be their protectors, that they were not to be considered accountable. The inquest was then adjourned to the 15th, for the purpose of examining the seamen belonging to the smack, which the owner had again sent to sea.

A Rare Case.—A few days since an inquest was held at Enfield, on the body of George Healy, aged 77 years, an agricultural labourer, who died suddenly on his return from labour on Thursday se'nnight. There was nothing particular with respect to the circumstances connected with the death, which arose from ossification of the heart. The portion worth noticing, however, is the happy manner in which deceased lived, so widely different from most agricultural labourers. To adopt the words of the Coroner, "the deceased and his wife might well be termed a lady and gentleman." For fifty years they had been married, and had brought up a large family of children in the greatest respectability, almost solely by deceased's labour. Their place of residence was like a little palace, the furniture, &c., being of the best description, and in the neatest order. In the parlour was a book-case, filled with books, some of them elegantly bound, and of the best authors, ancient and modern. The deceased delighted in his labour, which he continued until the day of his death. He was well known for miles round Enfield, and was greatly esteemed. Several of the jury remarked that, if England was traversed from one end to the other, such a comfortable home, for an agricultural labourer, would not be found. The surgeon of Enfield having stated the cause of death, the jury returned a verdict of "Died by the visitation of God."

The late Duke d'Angouleme.—The will of his Royal Highness Louis Antoine, Comte de Marnes, heretofore Dauphin of France, has just been proved in Doctors' Commons by Jean François, Baron Billot, one of the executors, a power of proving hereafter being reserved for the Duc de Blacas and G. Isidore de Montbel, the other executors. The personal property is sworn under 250,000*l.* The deceased begs of his wife forgiveness for any involuntary wrongs he may have done her, and desires to be buried wherever he may die, in the simplest manner, and leaves 25,000 francs for masses to be said for the repose of his soul. He also leaves 25,000 francs to the poor. The various other legacies amount to about 22,000 francs; and he then bequeaths the whole of his property (with the exception of these legacies) to his wife, and at her death directs that two-thirds shall go to his nephew, and the remainder to his niece. He directs that in the event of a new restoration his wife should "look to those who had been always kind to him." The will is dated in 1840.

Occupation of the Royal Exchange by the Merchants.—This interesting event occurred on Wednesday, and the muster on 'Change, though the day was not a foreign post-day, was very considerable. The merchants generally seemed to be satisfied with their new quarters, but some of them think that the Exchange ought to have been roofed, like the Bourse at Paris; while others are of opinion that though a roofed hall might be convenient at this time of the year, in the summer, and particularly in wet weather, the heat and steam would be insufferable. Some of the merchants complain of draughts of cold air, an evil which it is intended to remedy by the introduction of inner doors, should the inconvenience be found to be important. It is stated that, in commemoration of the honour conferred on the city of London by Prince Albert, in laying the first stone of the Exchange, and in testimony of their loyalty to Her Majesty and the Prince, for honouring with their presence the ceremonial of its inauguration, the merchants, bankers, shipowners, underwriters, and others interested in the commerce of the city, propose to erect by subscription, a full-length statue in marble of his Royal Highness, to be placed in the vestibule of Lloyd's, or in such other situation in the Royal Exchange as may, with the approbation of the Gresham Committee, be hereafter determined upon. A committee of some of the most influential merchants of the city is in course of formation to carry out the object.

French Protestant Church.—On Thursday the foundation stone of a new French Protestant church was laid by the Bishop of London, between Charlotte-street, Bloomsbury (now called Bloomsbury-street), and George-street, St. Giles's, a large open space well adapted for the purpose. Among the clergy present were the Rev. C. B. Dalton, the Rev. Dr. Vivian, the Hon. and Rev. H. M. Villiers, the Rev. J. Endell Tyler, the Rev. T. Ward, &c. Several hundred persons were present at the ceremony. After an address from the Rev. J. Mudry, the appointed minister, prayers having been read, the foundation stone was lowered with the usual formalities. The church is to be in the Elizabethan style of architecture, with accommodation for 500 or 600 people. In the course of his address, the Rev. J. Mudry made the following observations on the progress of French Protestantism in England. He said, "If such a ceremony is interesting in a high degree on any occasion, it must be doubly so in the present circumstances, when a congregation of foreign origin, most conspicuous by their woeful history, and not less distinguished by their constancy in the true faith, than in the language of their forefathers, are straining every nerve to raise this pious edifice, not only for the worship of the Almighty, in that very language, but also for a monument, in memory both of the sufferings of their persecuted forefathers, the French Protestant refugees of old, and of the protection, hospitality, and generosity which they sought and found in this land of toleration. We trace the beginning of this French congregation as far back as the year 1640, when they assembled to pray near

Whitehall, where they remained more or less unknown during the civil war and the commonwealth. But hardly was the Church of England aware of its re-establishment with the happy restoration of Charles the Second, than the French congregation of Westminster, as it was then called, became conformists, and adopted for the worship of God the English Prayer-book, translated into French. In the year 1661 Charles the Second established this Conformist French congregation within the walls of the old Savoy Palace, Strand, graciously provided in part for its perpetuity in this country, and placed it under the immediate jurisdiction of his Grace the Archbishop of Canterbury and the Lord Bishop of London. From that epoch this congregation has generally been called the French Protestant Episcopal Church of Savoy, and honourable mention is frequently made of it in the copious histories of the Reformation of the Church of England. This French Church, ever faithful and submissive to the Episcopal authority, under which it has been kindly reared, has enjoyed many benefits and instances of paternal protection from the uniform kindness of the Bishops of London and the Archbishops of Canterbury. Nevertheless it has, up to this time, passed through many and various vicissitudes, and we may now truly say, Blessed be the Lord God that has supported us when we were very low, and has helped us out of our misery. Long it had been desired and projected among the French refugees to raise and bequeath to their posterity a lasting place of worship in which the offices of the Church might be performed in the French language —the language of their ancestors. And now, thanks to the Almighty, as also to the patronage and liberality of the Lord Bishop of London and of his Grace the Archbishop of Canterbury, and thanks to the charitable donations of all ranks of society in England, from the most exalted to the most humble, we are finally enabled with their subscriptions, and our other funds, almost to complete not only this pious undertaking for the religious advantage of our Christian brethren, but also a spacious charity-school for the education as well as the temporary and spiritual advancement of our needy rising generation."

Dissolution of the Kensington Union.—During the last two years strong efforts have been made by the inhabitants of St. Mary Abbotts, Kensington, to obtain the separation of that parish from the Kensington Union, consisting of the parishes of Kensington, Paddington, Hammersmith, and Fulham, which, it was contended, was too large to be worked satisfactorily to the interests of either the rate-payers or the poor. Rate-payers' associations were formed, vestry meetings called, and a permanent committee appointed, through whose exertions a clause was introduced into the last new Poor-law Act, empowering the Poor-law Commissioners to separate parishes having a population of upwards of 20,000 inhabitants from Unions already formed, if they see fit, without the concurrence of two-thirds of the Board of Guardians. At a vestry meeting held in the early part of last summer, a series of reasons for a dissolution of the Union was drawn up and agreed to, and sent to the Poor-law Commissioners, and a deputation appointed to wait on them. About a month since the deputation had an interview with two of the Commissioners, and at its close the Commissioners told the deputation that they would well consider the representations made to them, and forward their answer as speedily as possible. On Thursday, at the usual weekly meeting of guardians of the Kensington Union workhouse, a communication from the Poor Law Commissioners was received, expressing their intention to dissolve the Union. The following are the arrangements proposed to be made:—1. To place Kensington parish under a separate board of guardians, appointed according to the Poor Law Amendment Act, by virtue of the power in section 66 of 7th and 8th of Victoria, cap. 101. 2. To place Paddington parish under a separate board of guardians. 3. To retain the parishes of Hammersmith and Fulham, united as at present for the relief of the poor.

Frauds on the Post-office.—An extensive seizure of letters for the West Indies was made by the Custom-house authorities on board the Trent, the last steamer which left Southampton for the West Indies. The letters were found concealed with newspapers and samples directed to the French Antilles. The practice of smuggling letters on board the mail-steamers appears to exist to a great extent, notwithstanding the vigilance exercised by the Custom-house officers. There appear to be well-organised schemes in France for collecting and smuggling letters into this country, and attempts are then made to get them to foreign parts, by means of a mail-packet, without the payment of postage.

Covent-Garden Market.—An order has been issued by the Commissioners of Police, for the better regulation of the carts and waggons going to Covent-Garden market; and police constables are appointed to see that they draw up in the centre of the streets, so as to allow a free passage on each side, and a clear space over the crossings. Any person offending is liable to be taken into custody, and subject to a fine of 40s. for each offence.

The Fog.—On Sunday, a few minutes before 12 o'clock, the Metropolis and its environs were visited with so dense a fog that, though mid-day, it had the appearance of night. At many of the churches and chapels it was necessary to have the lamps lighted, to enable the clergymen to proceed with the service. The steamers and other vessels on the river dropped their anchors, it being impossible to discern objects ten yards distant. About 2 o'clock the wind shifted, when rain commenced, and the fog dispersed. It appears, however, to have extended over most parts of the country. In Manchester the darkness on that day and on Monday rendered artificial light necessary, and in Scotland also the fog was equally dense.

The Late Fire in Guildford-street.—The adjourned inquest was resumed on Monday, before Mr. Wakley, and the bodies of the four persons burnt having been identified, the examination into the cause of the fire proceeded. Mr. Wakley said he had received a plan of the premises from Mr. Braidwood, who, at the bottom of it, said, "In my opinion the fire arose from a hot-air flue in the washhouse." Mr. Farey here explained that there was an ironing stove at the back of the house, the flue of which ran into the body of the house at the rear, near the landing of the first floor, and where it formed an acute angle; and there could have been no means of clearing the soot, which must have been gathering for years. There had been no fire in the stove from Wednesday, so that, in all probability, the soot must have been alight, and smouldering, from that day. He had no idea until now of the dangerous construction of the flue, or he would have pulled the house down to its foundation. The Coroner observed that the soot might have been collecting from the time the house was built. It was very important that Mr. Farey's statement should be put on record, as it might put other persons on their guard who resided in similarly constructed houses. Witnesses were examined, who proved that the house was very badly built, having no girders beneath the drawing-room floor, and being little better than lath and plaster. The jury, after a long sitting, returned a verdict of Accidental Death, with an opinion that the fire originated in one of the two flues mentioned in the evidence. Since the inquest, the remains of another body have been found among the ruins.

Inquests and Suicides.—On Saturday a newsvender in Whitecross-street committed suicide by taking laudanum, and attempted to murder his little girl by the same means. The Jury at the inquest returned a verdict of temporary insanity.—An inquest was held at Hampstead on Tuesday on the body of F. Clissold, Esq., brother of the rector of Stoke Newington, who had been in the habit of taking prussic acid to relieve the mental depression brought on by excessive study. There was no evidence that deceased contemplated suicide, and the Jury returned a verdict that he died from taking an over-dose of prussic acid.—On the same day Mr. Wakley held an inquest on a cab driver named Watts, who died in consequence of taking tartaric acid, administered by a chemist called Watkins, in Myddelton-street, by mistake for Epsom salts. The Jury returned a verdict of manslaughter against Charles Watkins.—On the same day an inquest was held on the body of Mr. Mayow, solicitor of Excise, whose death was supposed to have been hastened by the late fire in Guildford-street, where he resided. Dr. Latham however stated that deceased had been ill for some time, though the fire might have made an impression on his mind. The Jury returned a verdict of natural death.—On Wednesday an inquest was held on the body of Mrs. Renton, wife of Dr. Renton, M.D., of Madeira, who destroyed herself on New-Year's morning by cutting her throat in the closet of the Adelphi Hotel. It appeared that the unfortunate lady had been insane since October last, and that Dr. Renton had brought her to England in order that she might have the advice of various medical friends. Before leaving Madeira, she had attempted her life several times by strangulation, and had also done so on the voyage. It was stated that she was an amiable woman, and had every comfort in life. The Jury returned a verdict that deceased destroyed herself whilst in a state of insanity.

The Inquest at Staines.—On Saturday Mr. Wakley resumed the inquest on the man and his wife who were found dead under the mysterious circumstances noticed in our last. It was proved by the medical and other witnesses that the woman died by suffocation, and the man by arsenic. It was also proved by one of the children, that the father had, contrary to his usual custom, put the tea into the pot on the previous night; and other witnesses deposed that the man bore a bad character, and was uniformly cruel to his wife. The Coroner said, after the evidence adduced, the only verdict the jury could return, would be one of wilful murder against the man for the woman's death, and self-murder as respected his own. Nothing could be more clear and conclusive as to that point than the medical evidence. Then there was the evidence of the boy to the man putting the tea into the teapot, which would lead to the conviction that it was his intention to destroy them all; and that finding he had failed in doing so, he effected his end by suffocating his wife. The jury said they were unanimous in coming to the same conclusion, and returned a verdict of wilful murder as to the death of the woman, and *felo de se* in the case of the man. The effect of the latter verdict is, that the body of the man has been interred in the churchyard at twelve o'clock at night, without any service being read over it.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Dec. 28. West Districts, 170; Northern, 234; Central, 224; Eastern, 250; Southern, 371; Total, 1249. Weekly average for the last five years, 946.

Provincial News.

Bolton.—The local papers mention as a creditable fact, that in the small village of Darwen, midway between this town and Blackburn, the members of the Mechanics' Institute, though speaking the broadest Lancashire dialect, recently engaged Mr. Charles Kemble to read to them a play of Shakspeare. They had heard of Mr. Kemble's reading before the Queen, and they applied to him to visit their Institute for the same purpose. Mr. Kemble accordingly read to them on the nights of Wednesday and Thursday week, and received 20 guineas for each reading.

Cambridge.—A subscription is now in progress for the purpose of enabling the Rev. R. R. Faulkner to meet the law expenses incurred in opposing the stone altar and credence-table which the Cambridge Camden Society erected in the Round Church, Cambridge. The Bishop of Llandaff has contributed 5*l.* to this fund, announcing his donation in the following letter:—"Rev. Sir,—With great pleasure I send the 5*l.* which I promised, in token of my admiration of the firmness with which you have resisted a measure injurious to the purity of our faith as restored by the Reformation, to the maintenance of which we are all solemnly pledged. Whatever may be the issue of the suit, the value of your example will not be lost. I am, &c., E. LLANDAFF."

Chester.—The parricide, Mary Gallop, who was convicted at the last assizes of the murder of her father, was executed in this city on Saturday. Great efforts had been made to save her life, on the ground of insanity, and petitions signed by the bishop, clergy, and others, were forwarded to the Home Office in order that her sentence might be commuted to confinement or transportation for life. Sir J. Graham, however replied, that after due investigation of all the points urged in favour of the prisoner, together with the evidence adduced at the trial, it was deemed inconsistent with the duty of Government to arrest the course of law.

Croome.—On Friday an inquest was commenced on the body of Thomas Staite, the gamekeeper, who died from the injuries he received from the gang of poachers in the preserves of the Earl of Coventry. After hearing several witnesses, the coroner adjourned the inquiry to the 7th January. Three men, named Francis Dingley, Samuel Turvey, and William Brimfield, have been apprehended on suspicion of being concerned in the murder.

Derby.—About five years ago, a young man named Dixon Manning, who was in the service of a clergyman in a neighbouring county, ran off with his master's daughter, whom he married at St. Peter's church, in this town. The clergyman obtained a divorce, after which the man paid his addresses to a young woman named Allen, the daughter of a copper-plate printer in Derby. Some delay occurring on the man's part in regard to the marriage, the girl told him she should break off the engagement. On Friday last, Manning made his appearance at her father's house, and induced her to drink a glass of poisoned ale. She was instantly seized with illness and carried to bed, and the man then committed suicide in her presence by taking prussic acid. The young woman, however, is likely to recover. An inquest has been held on the body of the man, when the jury returned a verdict of *Felo-de-se*.

Exeter.—The agitation on the subject of the Bishop's Pastoral Letter continues unabated. A correspondence between the bishop and various parties in the diocese has been published since our last notice, but with a few exceptions, no new facts have been stated on either side. Dr. Bull, however, has published a letter to the bishop, in which he denies, in positive terms, that he attempted to influence the laity of Exeter against the pastoral letter. Dr. Bull states, that he attended no meetings, sought no interviews, offered no suggestions, "in a word," he says, "*I had no communication whatever* with any of the parties (most of whom I know not even by name) that have been instrumental in convening the parochial meetings. In fact, I had left Exeter before the pastoral letter was issued to the public at large; and my answer to the Prebendary was not published until at least two parish meetings had been actually holden, and more had been advertised in the papers." The Bishop has noticed very few of the resolutions adverted to in our last. In his reply to the Churchwardens of St. Andrew's, Plymouth, his Lordship states, that the meeting having been held in the church, contrary to the law of Church or State, he cannot permit himself to pay any attention whatever to its proceedings. His lordship, however, addresses a long letter to the Churchwardens of Charles, the other parish church of Plymouth, in which he enters at length into the questions at issue. His lordship says:—

"There are two particulars on which your meeting thought it necessary to record its opinion—the use of the surplice in preaching, and the offertory. The former, 'although in itself a matter of indifference,' the meeting considered as 'the symbol of a party.' Now, my order on the subject was expressly designed to prevent its being any longer 'the symbol of a party,' by making it to be worn by all. I could not order the gown to be worn by all, and therefore made the only order in my power, which could take it out of that schismatic character. As, however, I have found that the use of the surplice in preaching is still associated (not only at Plymouth, but in many other places), with the superstitions of Rome, I have withdrawn the part, but only that part, of the direction given to my clergy in that letter. In respect to the offertory, you say that 'the weekly offertory has, in a great measure, been superseded by the poor rates.' To this I answer first, by expressing my astonishment that any Christian, who looks to the Bible as his rule of conduct, can think that an Act of Parliament has, 'in a great measure,' or in any measure, 'superseded the duty of almsgiving,' which is commended to us by so many precepts of our Lord and of his apostles. Secondly, I answer, that the Legislature both of Church and State, in 1662, when poor-rates were as much the law of the land as at present, did not think with you. They required, by an express direction (a fuller direction than in the Rubric of former books), that, whenever the communion service be read (whether the Holy Sacrament be administered or not), 'the priest shall return' from the sermon 'to the Lord's table, and begin the offertory, saying according to his discretion, one or more of the sentences' from Holy Scripture, which declares the duty of almsgiving. And the following Rubric directs, that when more than one sentence be read, a

collection be made of 'alms for the poor, and other devotions for the people.' My pastoral letter interferes with the discretion here left to the minister, only by desiring him not to have a collection where the feelings of his congregation are averse to it. Can this be deemed an undue pressing of the offertory, even though I tell my clergy 'to use all Christian persuasion to raise their people to a better mind?' As to 'occasional sermons for local claims, and in behalf of public institutions,' mentioned by the meeting, I doubt not that they are for objects worthy of Christian beneficence, and I rejoice therefore that they are had. But can it be gravely said, that the collections for the objects recommended in these sermons are a just matter of complaint or jealousy, because they are to be made in the manner prescribed by the law of the Church, that is, while the sentences of Holy Scripture in the offertory are reading? Be it remembered, too, that until the Rubric of 1662 was introduced, no 'other devotions of the people could lawfully be collected in church, except alms for the poor,' and 'the due and accustomed offerings to the curate.' Therefore it is that Rubric only which justifies and renders lawful any sermon for the public institutions of which the meeting deems so highly."

The Bishop has also explained his views at still greater length in a letter to Mr. C. M. Phillipps, a county magistrate, prior to a public meeting held on the 26th inst., at Torquay, where the Bishop resides. In this document his lordship explains how far he agrees with the Tractarian party, and says :—

"He really does not know who are the persons or parties included under that denomination. If it be applied to those only who are seeking to assimilate our reformed Church to the corrupt Church of Rome, who ostentatiously adopt external signs and forms not commanded by our Church, who speak with affected or suspicious tenderness of the corruptions of Rome, who renounce the title of Protestants—above all, who decry our own Reformation, and disparage the labours of these holy men who, by God's mercy (using even the vices of princes and statesmen as instruments of His glory), were enabled to effect it,—Tractarians such as these, or by whatever other name they might be called, had in me an avowed and most uncompromising opponent. But I must add, that I am very sorry to observe the too frequent application of that nickname to some of the best and soundest divines among us—to those who faithfully preach the whole gospel, and all the parts of it, in their due proportion — especially the necessity of the use of the sacrament to salvation, the new birth given unto us by God in baptism, the actual communication of the body and blood of Christ (with all the inestimable benefits of His passion) to the soul of every faithful receiver of the Lord's Supper, the privileges of the Church, which is Christ's body, the sinfulness of violating the unity of that Church, the apostolic succession of its ministry, the want of any covenanted promise of salvation to those who have never been 'added to the Church' or have renounced its communion. I avow, that if these men are designated by the name of 'Tractarians,' I desire to take my part with them in this world, and (I trust in God's mercy) in the world to come. Among them, if they were now alive, would be all the real reformers and soundest doctors of our Church from the time of the Reformation; such as Cranmer (and those who were joined with him in compiling the homilies), Jewell, Hooker, Hall, Pearson, Barrow, Jeremy Taylor, Beveridge, Waterland. The object of my pastoral letter is indeed to promote, with God's blessing, the cause which was and is dear to the hearts of all such men, be they called 'Tractarians' or not. For I know not how the truth can better be maintained, nor how the stratagems of Rome can be more effectually defeated, than by upholding our own true and reformed Church in its unity, its discipline, its divinely constituted polity."

The Bishop also defends himself from the attacks made upon him for permitting Dr. Pusey to preach in his diocese while under a sentence of the University of Oxford. He says that—

"It is manifest, that if I had refused to permit Dr. Pusey to preach at Ilfracombe, I should have been adopting the sentence of the University, and extending it to this diocese. I should probably have so done, if the form of proceeding at Oxford had been such as I could acknowledge to be consistent with those principles which I feel it my duty to observe in administering discipline in my own diocese; but deeming it absolutely irreconcilable with those principles, I felt it my duty, at whatever hazard of obloquy and misrepresentation, to refuse to commit the injustice of dealing with Dr. Pusey, on account of the sentence passed on him at Oxford, otherwise than he would be entitled to be treated if no such sentence had passed. I will add, that so little do I sympathise with any Papalising party in the Church, that a few weeks ago I withdrew my name from the list of members of a society to which (on account of its original object and of its founders) I had considered it an honour to belong—the 'Camden Society' at Cambridge—on discovering that its zeal exhibited the Virgin Mary crowned, with the infant Saviour in her arms, and attended by two saints not recognised in her own calendar. This I deemed to be, at the least, a most injudicious insult to the feelings of Protestants at this crisis, against which it was my duty to protest."

The meetings throughout the diocese are daily becoming more numerous and important. On the 26th a public meeting of the inhabitants of Southmolton, convened in consequence of a requisition signed by persons of all political parties, was held in the Market-house, the churchwarden in the chair. After some preliminary discussion, a petition was proposed by Earl Fortescue to both Houses of Parliament, and another petition to the Queen, to the same effect, was moved by Lord Ebrington, both of which were unanimously adopted. The petition, after deploring the revival of ceremonies and usages which by common consent had been allowed to fall into desuetude, concluded with the following prayer:—"To take such steps as in your wisdom may seem fit, for remedying the grievance of which we complain, and for healing the differences which in these times unhappily prevail to so great an extent among those who profess to hold the same faith and to belong to the same national church." At Torquay, on the same day, and at Saltash on the 23d, resolutions opposed to the Bishop's views were unanimously adopted, after very strong expressions of feeling from the principal inhabitants. At Helston, where the Bishop's views were first promulgated, the adoption of the rubrical forms has led to a remarkable result, the local papers stating that in a gallery capable of holding 250 persons, only one, besides the organist, was seen on Christmas-day. The parishioners have also, by a large majority, refused a church-rate, although the sum asked by the churchwardens was only 1*d.* in the pound. Meetings have also been held at East Teignmouth, Newton Abbot, Tiverton, Clisthydon, and St. Pancras (Exeter), at all of which resolutions deprecating the requirements of the Pastoral Letter were agreed to. The most important meeting, however, which has yet been held in the diocese took place on Thursday at Exeter, having been convened by the Mayor in compliance with a requisition signed by 1850 heads of families in the Cathedral city. The Mayor presided, and the meeting was attended by from 1500 to 2000 persons, including most of the principal inhabitants. Resolutions condemning in decided language the revival of obsolete ritual observances were carried with only one dissentient, and petitions to the Queen and to both Houses of Parliament founded upon the resolutions were adopted unanimously. It was also resolved,—"That it is the opinion of this meeting that passive obedience or non-resistance on the part of the laity at this momentous crisis will strengthen and encourage the known and avowed systematic attempt of a party to bring back our and their Protestant Church to usages which are associated in the minds of the people with the superstitions and corruptions of Rome; and that they are resolved to declare and defend Protestant principles, the true foundation of the glory of England."

Hurst.—The Berkshire Chronicle says,—"We are authorized to state, that the steps taken by Mr. Cameron in giving up the use of the proper concluding portion of the morning service, has, though not directed by the Bishop, since received his lordship's full sanction and approval, in consideration of the extreme evils to be apprehended in the parish if another course were persisted in."

Ipswich.—The authorities of this town have received a communication from the Home Office, directing that the execution of Mary Sheming, for the murder of her grandchild, be postponed to Saturday next, the 11th inst. The execution of the two other criminals under sentence of death in this prison being ordered to take place on the 25th, it is not improbable that, in deference to the earnest petition of the authorities, the female prisoner may receive a further respite.

Jersey.—A peremptory writ of *habeas corpus ad subjiciendum*, issued by Baron Rolfe on the 23d ult., and returnable in the Queen's Bench, has been served on the Viscount of Jersey, and on the gaoler of the island, commanding them to bring up to the Court of Queen's Bench the body of Mr. Carus Wilson. The writ is made returnable on the 18th of this month. The Viscount and his subordinates are said to have made ludicrous efforts to avoid the service of the writs; and when it was ultimately delivered to his clerks, they threw the copies of the writ after the persons who had presented them.

Norwich.—On Sunday week the Bishop of Norwich preached a sermon at the parish church of St. George's at Colegate, in this city, to an overflowing congregation, among whom were many of the Dissenters, in aid of a collection for the repairs of the fabric, the Dissenters having successfully resisted a compulsory rate, and the Church people having consented to adopt the voluntary principle. His lordship, after the afternoon service had been read, preached a sermon upon Ephesians, chap. v., ver. 32: "I speak concerning Christ and the Church." In treating the subject his lordship took a brief review of the Church from the Apostolic age, noticing the gradual falling away of the Church of Rome till its general corruption at the time of the Reformation, acknowledging that the remains of error were still to be found in the services and rubric of the Church; and hoping that another generation would not pass away before it should be purged of these Papistical remains. The deterioration of the clergy of the English Church in the 18th century, and the present improved state of the priesthood, were passed under review, his lordship taking special notice of the Tractarian principles, and their prevalence in some of the other dioceses in the kingdom, and openly renouncing them as being a step backwards to Popery. They were the hay, straw, and stubble of religion, and their introduction had a great tendency to cause discord in the parishes where they were introduced. He rejoiced that, with a few exceptions, they had not been introduced into his own diocese; and he assured his hearers they would have no countenance whatever from him. Their object was to exalt the clergy, giving them all the power in the Church, and almost excluding the laity, and to destroy the principles of free inquiry so nobly asserted at the period of the Reformation. With regard to church-rates, which had so long and so unhappily been a subject of division in this parish, he advisedly refused to enter on that question; he would not rake up old disputes and heart-burnings. He hoped these had now passed away, and that a better spirit—a spirit of peace and union—would pervade all parties in future. At the end of the service a collection was made, which amounted to 18*l.* 15*s.* 10*d.*

Portsmouth.—The Admiralty have directed Sir W. Symonds, Surveyor of the Navy, to construct a corvette, for the purpose, it is supposed, of competing with the Janus, built by the Earl of Dundonald. It is said that there will be a trial of corvettes in the spring.—The Admiralty have received from Commodore Jones, the senior officer of Her Majesty's squadron on the west coast of Africa, a letter, inclosing one from Commander Scott, of the Hyacinth, giving an account of the gallant conduct of Mr. J. F. Tottenham, mate of that vessel, in capturing a slave brig in a four-oared gig with only one spare hand, on the 13th August last, and recommending him for promotion. In consequence of this statement, the Lords of the Admiralty have promoted Mr. Tottenham to the rank of Lieutenant.—The recent trials of H.M.'s steamer Dwarf, with different screw-propellers, has terminated by showing that the screw invented by Mr. Smith has an advantage over those of Messrs. Rennie and Steinman.

Romford.—In the Court of Bankruptcy on Saturday the case of the Romford Bank, under the bankruptcy of Johnson and Mann, was brought under consideration, an application being made to the Commissioner to appoint sittings for declaring a dividend. The solicitor for the assignees said the creditors under the separate estate of Mann would be paid in full, and the surplus carried over to the joint estate of Johnson and Mann; the official assignee stated that the balance-sheet showed that Mr. Mann's debts only amounted to 30*l.*, caused only by weekly bills. Commissioner Goulburn said that this was very creditable to Mr. Mann, and appointed the 22d January for the payment of the first and final dividend (20*s.* in the pound) on the separate estate of Mr. Mann; and the 3d February for the first dividend on the joint estate of Johnson and Mann. It is understood that the assets realised will amount to 12,000*l.*, and after the payment of Mr. Mann's very few creditors the creditors of the bank will be paid about 2*s.* 6*d.* in the pound. The debts proved are about 40,000*l.*

Shrewsbury.—A melancholy event occurred a few days since at Newport, on a sheet of water in Chetwynd Park, belonging to B. Borough, Esq., High Sheriff of Shropshire. On the above day, four young ladies, two of them daughters of the Rev. W. Sandford, incumbent of Newport, the third, Miss Hathaway, governess in a respectable family in the town, and the fourth, a daughter of the late Rev. J. Chalmers, Independent minister of Stafford, after a short walk, ventured on the ice to watch the evolutions of two or three skaters. The young ladies imprudently ventured on some new ice, from which spot, a day or two previously, a large quantity had been taken for the supply of the ice-house on the estate. The consequence was, that the whole of the party were, by the ice breaking, immersed in the water. By great exertions the Miss Sandfords and Miss Hathaway were saved from drowning, although in a very exhausted state; but it was impossible to rescue Miss Chalmers until life was extinct. An inquest has since been held, and a verdict of "Accidental Death" returned.

Slough.—An inquest has been held at Salt Hill, near this place, on the body of a woman called Sarah Hart, who resided at Bath Place, a row of houses near Botham's Hotel. The mysterious circumstances of her death have excited great interest for miles round. It appeared at the inquest, that deceased passed as a married woman, stating that her husband was the son of a Quaker gentleman, named Tawell, with whom she had lived as a servant, but he had been abroad for some years. The father, however, was in the habit of calling occasionally to pay her an allowance, although he disapproved of his son's marriage. On Wednesday evening the Quaker gentleman was seen to enter her cottage, and while there stifled groans were heard. On his departure the neighbours entered and found the woman dying. The Rev. E. T. Champnes, however, vicar of Upton, hearing of the circumstances, and that a person in the dress of a Quaker was the last man who had been seen to leave the house, proceeded to the Slough station, thinking it likely he might proceed to town by the railway. Mr. Champnes saw him pass through the office, when he communicated his suspicions to Mr. Howell, the superintendent at the station. The Quaker left for London in a first-class carriage. Mr. Howell then sent off a full description of his person, by means of the electric telegraph, to cause him to be watched by the police upon his arrival at Paddington. This was done, and after being followed to various parts of town he was apprehended at the Jerusalem Coffee House. On being apprehended he denied that he had been at Slough the previous night, and said he knew no one there. On being brought before the Coroner he said that his name was John Tawell, and that he was the Town Surveyor of Berkhampstead. The Coroner then adjourned the inquest to Saturday, and gave the prisoner into the custody of the Eton police, to be again brought up on that day.

Windsor.—The question relating to the supposed privileges of Royal Palaces, whereby persons living within their precincts are exempt from arrest, is likely to be brought to trial before the Upper Courts at Westminster. A short time since, a gentleman living near the Regent's Park took up his residence at one of the Military Knights' houses, and was there arrested, with the sanction of the Lord Steward, by an officer of the Sheriff of Berks, and conveyed to the county gaol at Reading, at the suit of a builder in London, for a judgment debt of about 3000*l.* The defendant, immediately after his arrest, took out a summons, calling upon the plaintiff and the Sheriff to show cause before one of the Barons of the Exchequer why he should not be discharged out of custody, upon the ground of the arrest having been illegal, the defendant having been captured within the precincts of a royal palace. The case was heard by Mr. Baron Rolfe, in chambers, on the 20th inst.; and last week Mr. Baron Rolfe stated that he had examined all the authorities which had been referred to, and also the affidavits which had been put in, and his decision was, that the summons be discharged. The defendant, who intends to bring the whole matter before the full Court next term, consequently remains in Reading gaol. It is said that Baron Rolfe's decision has caused great consternation in the minds of parties who had previously imagined that they were living in a state of privileged security.—The distribution of Her Majesty and Prince Albert's New Year's Gifts to the poor and needy families residing within the borough of New Windsor, took place on Wednesday morning in the New Riding-school at the Royal Mews, the Queen and the Prince being present. The number of families who were the recipients of the Royal bounty amounted to 510. In the centre of the building was a table

upwards of 50 feet in length, upon which were piled mountains of beef, of the primest joints, weighing nearly a ton, and decorated with laurel. At either end were two other tables, one containing pyramids of plum-pudding, and the other quartern loaves, similarly decorated. Along the walls, at the north and south sides of the Riding-school, tables were placed, upon which were displayed the blankets for distribution. The poor recipients, who were admitted at the western entrance by tickets, were ranged at the end of the building, where they remained till the arrival of Her Majesty and the Prince at ½ past 9. The distribution of the Royal gifts commenced immediately upon the arrival of the Queen, under the superintendence of the Mayor and magistrates of the borough, the clergy and churchwardens. The following is a list of the various articles which were given away :—180 families each received an excellent pair of blankets. The provisions were divided amongst 330 families, excluding those who had been supplied with blankets :—1819 lbs. of meat, 1395 lbs. of bread, 944 lbs. of pudding, 584 gallons of potatoes, 1032 pints of ale, and 330 cwt. of coals. The quantity of meat given to each applicant was regulated according to the number in the family, each male adult receiving 3 lbs., each female adult 2 lbs., and each child 1 lb.

York.—William Kendrew, who was convicted at the last assizes of the murder of Mr. Wm. Inchbald, farmer, of Low Dunsforth, near Boroughbridge, was executed on Saturday, in front of the county gaol. He had previously made a confession, stating that he committed the murder out of revenge for a threat made by Mr. Inchbald that he would have him transported for poaching.—A respite has been received in the case of William Potter, convicted at the late assizes of arson, at Wistow, near Selby, "until the further signification of Her Majesty's pleasure."

Railways.

The following are the Railway returns for the past week :—Birmingham and Gloucester, 2392*l.*; Bristol and Gloucester, 1107*l.*; Eastern Counties, 4228*l.*; Edinburgh and Glasgow, 1798*l.*; Great Western, 16,703*l.*; Grand Junction, 8438*l.*; Glasgow, Paisley, and Ayr, 1324*l.*; Great North of England, 1830*l.*; London and South Western, 5671*l.*; Blackwall, 596*l.*; Greenwich, 792*l.*; Brighton, 3639*l.*; Croydon, 362*l.*; Liverpool and Manchester, 4678*l.*; Manchester, Leeds, and Hull, 5735*l.*; Midland, 10 027*l.*; Manchester and Birmingham, 3285*l.*; Newcastle and Carlisle, 1571*l.*; Newcastle and Darlington, 1014*l.*; Preston and Wyre, 342*l.*; South-Eastern and Dover, 4517*l.*; Sheffield and Manchester, 561*l.*; York and North Midland, with Leeds and Selby, 2325*l.*; Yarmouth and Norwich, 220*l.*—The Railway Department of the Board of Trade have given notice in Tuesday's *Gazette*, that they "have had under consideration the following schemes for extending railway communication in the district comprising the counties of Cornwall and Devon, viz. :—The Cornwall and Devon Central Railway; the Cornwall Railway (Plymouth to Falmouth); the Great Western and Cornwall Junction Railway; the West Cornwall Railway; the St. Ives Junction Railway; the North Devon (Crediton and Barnstaple) Railway; the Exeter and Crediton Railway; the Torquay and Newton Abbot Railway, have decided on reporting to Parliament in favour of the Cornwall Railway (Plymouth to Falmouth); the West Cornwall Railway (up to the junction with the Cornwall Railway); the St. Ives Junction Railway; against the Cornwall and Devon Central Railway; the Great Western and Cornwall Junction Railway; and recommending the postponement until a future period of the North Devon (Crediton and Barnstaple) Railway; the Exeter and Crediton Railway; the Torquay and Newton Abbot Railway. And the Board having further had under consideration the following schemes for extending railway communication in the districts of Berkshire, Hampshire, Wiltshire, Dorsetshire, Somersetshire, and Devon, lying intermediate between the Great Western, Bristol and Exeter, and London and South Western Railways, viz., the Reading, Basingstoke, and Hungerford Railway (Great Western); the Wilts and Somerset Railway; the Bristol and Exeter, Durston and Yeovil Branch; the Southampton and Dorchester Railway; the Basingstoke and Didcot Junction Railway (London and South Western); the London and South Western, Salisbury to Yeovil; the London and South Western, Hook Pit Deviation; the Salisbury, Dorchester, and Weymouth Railway; have decided on reporting to Parliament in favour of the Reading, Basingstoke, and Hungerford Railway (Great Western); the Wilts and Somerset Railway, subject to the condition of applying to Parliament in a future session for an improved line of communication towards Bath and Bristol; the Bristol and Exeter, Durston and Yeovil Branch; the Southampton and Dorchester Railway; and against the Basingstoke and Didcot Junction Railway (London and South Western); the London and South Western, Salisbury to Yeovil; the London and South Western, Hook Pit Deviation; the Salisbury, Dorchester, and Weymouth Railway." This document is signed by Lord Dalhousie, Mr. S. Laing, Mr. O'Brien, Mr. G. R. Porter, and Mr. Coddington.—The line of the Newcastle and Carlisle Railway has been suddenly interrupted by the falling in of the tunnel between the Riding-mill and Corbridge stations. The company were engaged in widening the tunnel in order to form a double line of railway, it having been originally made single in this part, and the shores put in having been insufficient to support the superincumbent mass, it fell in suddenly on Saturday last, only a few minutes after the passage of a train. Fortunately no lives were lost, but the injury to the works is so great as completely to interrupt the traffic on the line, and the passengers are transferred to omnibuses, and the luggage to waggons, in which they are conveyed the intermediate distance by the turnpike-road, which runs at no great distance from the railway. Some time must elapse before the line can be again opened throughout.—The charge to the grand jury of Nottingham at the late Assize, by Mr. Justice Patteson, being in direct opposition to the verdicts of manslaughter returned against Messrs. Lightfoot and Raven by the two coroners' juries, which held inquests upon the bodies killed on the Midland Railway on the 21st Nov., has excited an interest both in the town and county, almost of an unprecedented character. The whole of the jurors concurring in the verdicts of manslaughter (and there were but two dissentients out of 33 jurors), immediately after the publication of Mr. Justice Patteson's charge, assembled at the Exchange-hall, where they have since held adjourned meetings up to the present time, with a view of adopting a course to remove, if possible, the effect of the reflection cast upon them by his lordship, and to justify the verdicts they had returned. These meetings have resulted in the adoption of a letter, addressed to the learned Judge, on "the subject of his charge and the crime of manslaughter."—It is said that the directors of the London and Birmingham Railway have determined to carry coals at 1*d.* per mile per ton, and that the waggons and carriages for their conveyance are in progress, and will shortly be ready for use.—The work of laying down Wheatstone and Cooke's Electric Telegraph on the South Western Railway, from London to Gosport, is nearly completed. The posts, for sustaining the wires, which are fixed at about 50 yards distance, are put down nearly the whole distance, and the fixing of the wires is rapidly proceeding. The cost of the work, about 24,000*l.*, is borne in equal proportions by the Company and the Board of Admiralty.—The Greenwich railway has passed into the hands of the Dover Company, who have purchased it on a lease for 999 years, at a rental of 30,000*l.*, until it arrives at 40,000*l.* per annum. The Dover Company took possession on the 1st inst. This railway originally cost above one million sterling, or 300,000*l.* per mile. Its shares have realised 27*l.* 10*s.*, have been sold as low as 3*l.* 10*s.*, and are now purchased for 9*l.* 15*s.*, which in ten years will make the present share worth 14*l.* 13*s.* 9*d.*, paying the whole time 4 per cent. in perpetuity.—On Thursday, a special meeting of the London and Croydon Company was held at the London-bridge station, when resolutions were passed authorising the directors to apply to Parliament for powers to widen or enlarge the London and Croydon, the London and Greenwich, and Bricklayers' Arms lines, with the view of laying down an additional line on the atmospheric system; the formation of a line from the Croydon Railway to Chatham, with a branch to Gravesend; an extension of the proposed Chatham line to join the Canterbury, Ramsgate, and Margate, at Chiloam, with branches to Sheerness and Faversham Creek; the construction of a line from the Croydon Railway to Maidstone, with a branch to Tonbridge; an extension of the Maidstone line to join the South Eastern at Ashford; an extension of the Epsom line to Dorking, unless provided for by the Direct Portsmouth, and a branch to Orpington, unless provided for by the Chatham line. The chairman, at considerable length, entered upon a review of these projects, predicting their success in Parliament, and announcing that they had received the support of the influential shareholders, including a large number resident at Leeds. By the proposed extension of the Croydon line, on the atmospheric system, the public would be supplied with a cheap and effective communication throughout North Kent. After dwelling on the matters in dispute between the Croydon, Brighton, and Dover Companies, which had compelled the latter to adopt their present system of defensive policy, the resolutions were carried.—The "first sod" on the line of the Cashel railway was raised on Tuesday by his Grace the Duke of Leinster, near Adamstown Castle, about 7 miles from Dublin, in the presence of a large company and all the work-people and labourers who have been engaged for the work. The scene was a very cheering one. His Grace stripped off his coat, and in his shirt-sleeves handled the spade "like a man." Having dug up six sods, he threw them into a wheelbarrow, and rolled them off in a style which excited the admiration of the surrounding countrymen, who cheered him most vociferously. Tents were pitched for a handsome luncheon, ordered by the directors, and all the work-people were regaled with a substantial repast. The occasion was an interesting one, as the first important beginning of the railway system in Ireland.—The Edinburgh, Glasgow, and Airdrie railway, which makes a direct communication between the town of Airdrie and the Edinburgh and Glasgow railway at Kirkintilloch, was opened by the directors on an experimental trip on the 25th. The train left Airdrie at half-past 12 o'clock, and arrived at the terminus in Glasgow at a quarter past 1—thus performing the trip in three quarters of an hour. The railway was opened to the public on Thursday week.

Ireland.

Dublin.—The report of the pending negotiation between the English Government and the Court of Rome has caused a great sensation among all parties in Ireland. The accounts of Mr. Petre's mission, which the Dublin Papers published on the authority of letters from Rome, derived some confirmation last week from an article in the *Times*, on the expediency of establishing political relations with the Pope. This article is regarded as a ministerial "feeler," and it is generally believed that some such measure is in contemplation, although the fact of Mr. Petre's mission, which was announced in an Irish Conservative journal so far back as the 4th September last, was altogether slighted as unworthy of credence. The Catholic and Repeal organs, with scarcely an exception, express their alarm at this intelligence, denouncing it as a fresh design on the part of England on the independence of the Roman Catholic Church in Ireland; while the organs of the Church party cautiously describe it as pregnant with eventful consequences to the position of the Established Church, and to the future government of the country.—The agitation against the Bequests Bill still continues as violent as ever. Dr. Coen, Bishop of Clonfert, has denounced the measure at Loughrea; and the Roman Catholic journals teem, as usual, with articles, speeches, and resolutions, fiercely condemnatory of the measure and of the three prelates who had the moral courage to act according to the dictates of their consciences. At a meeting held at Belfast, at which resolutions against the measure were adopted unanimously, Bishop Denvir, one of the Commissioners, attended and made an important statement as to the condition on which he had accepted the office. In the course of his observations, he stated that he accepted the commission under the condition that the objectionable clauses would be so amended in the next session as to meet the approval of the Catholic hierarchy; and if these objectionable clauses would not be modified in the ensuing session, so as to meet the approval of the Catholic hierarchy, he for one would resign his office as a commissioner. The bishop having addressed the meeting at considerable length, and expressed himself to the effect that it was perfectly fair and reasonable that the Catholics of Belfast should, as in other parts of the kingdom, record their opinions of the merits or demerits of the Bill, retired, accompanied by several gentlemen who had taken a leading part in the evening's proceedings. A committee of nine was then appointed to draw up resolutions, and to make the other necessary arrangements for an aggregate meeting of the Catholics of Belfast, to be held at the earliest day possible, to protest against the measure.—The weekly meeting of the Repeal Association took place on Monday. Mr. O'Neill Daunt was in the chair, and briefly addressed the meeting on the threatened concordat between the Pope and the English Government, which he denounced in the most emphatic terms, and declared his conviction that any rescript, having reference to such a subject, would be received by the Irish people as so much waste paper. The Secretary having acknowledged the receipt of several remittances, Mr. S. O'Brien rose and moved the marked thanks of the Association to Messrs. Mackey and Molloy for their gratuitous exertions in conducting the recent registration of the city of Dublin, and likewise to the learned gentlemen who attended the registration throughout the country generally, on the part of the Association. The hon. gentleman then went into some statistics for the purpose of showing that, at the last registry sessions the Repealers had gained considerably on their opponents, and urged on the people the necessity of further exertion. It was idle, he said, to expect that the legislature would confer on them a better registration system than that at present existing, and they ought, therefore, to avail themselves of the means within their reach towards achieving the regeneration of their country. At the next election the people of Ireland would have to dispose of several seats in Parliament. The number of members at present representing Repeal principles was quite inadequate to the state of feeling which prevailed. He would call on those members who, although they were Repealers, yet remained passive, to come forward and give effective and practical aid in working that cause of which they were but the nominal supporters, or they would have to render an account to their constituents when the proper time should arrive. They should imitate the generous and disinterested exertions of Mr. Hutchinson. The alternative they had to propose to candidates at the next election would be—if Repealers, a free and gratuitous return, if Anti-Repealers, a strenuous opposition and all its accompanying expenses. Mr. Grattan, M.P., seconded the motion in a lengthened address, in the course of which he pronounced the intrigues at present being carried on between the Pope and the British Government as a base conspiracy against the Catholic as well as Protestant, and that the object of them was to poison the mind of his Holiness, and create, if possible, an enmity between him and the people of Ireland. The Secretary announced the receipt of 40*l.* from Melbourne, New South Wales, and read a communication which accompanied the remittance. Mr. S. O'Brien having given notice that Mr. O'Hea would, on the next meeting, take a review of the proceedings of the Association for the past year, announced the rent for the week to be 178*l.* 16*s.*—It is stated, with something like certainty, that Sir James Graham and a portion of the Cabinet are favourable to the plan of founding two new colleges—one in Ulster, the second in Munster, Belfast and Cork being the localities fixed upon. It is understood that these establishments are to be founded and provided for by special charters and parliamentary grants, independent of all other funds; and that for the present they are to have the power of granting degrees in medicine, law, and arts, including music—divinity alone being excluded from their privileges.—One of the greatest fogs that has been recollected in Dublin for a number of years set in on Saturday

night, and has continued throughout the whole of Sunday. About three o'clock in the afternoon it seemed to have reached its climax, at which time so impenetrable had it become, that to pass through the streets was a task of considerable danger, and it required the utmost caution to prevent accidents.—The new Lord Mayor, Mr. Town-Councillor Arabin, commenced his year of office on Wednesday, in succession to Mr. O'Brien. There was the usual procession through the streets attendant upon the ceremony. Mr. Arabin, who is the fourth Lord Mayor under the Municipal Corporation Act, is a Protestant Repealer, and considered to be a man of moderate politics.

Limerick.—The disgraceful riots which attended the funeral of the late Earl of Limerick, have excited a general feeling of indignation and regret among the respectable classes throughout Ireland. The accounts published in the local papers, sufficiently prove the violence of the mob, although they differ as to some of the details. Lord Monteagle, who was present, has published a statement of the affair, for the purpose of correcting the errors of the papers, which stated that his lordship, "either not intending to accompany the remains of the deceased into the cathedral, or fearing that his carriage would be upset, descended, but was so jostled by the crowd that he took refuge in a public-house and concealed himself under a bed;" that "a troop of horse, with drawn swords, approached the house where Lord Monteagle was in durance;" and that "Lord Monteagle left his hiding-place and entered a carriage, in which were Sir Aubrey de Vere and other gentlemen." Lord Monteagle states that "there is not one of these four assertions which is not unfounded. A statement of the facts will be sufficient to show their inaccuracy. On approaching the cathedral in my carriage, I found to my astonishment, that by some extraordinary order, the iron gates were closed. It was thus rendered impossible for the procession to advance, and my carriage, as well as the carriages of others, was left in the midst of a violent and exasperated crowd. No one constable, no municipal authority, was available at the spot at this time to preserve order. Finding it impossible to proceed towards the cathedral, I, in common with others, left my carriage. From the want of any constables or police regulations, it was impossible, however, to reach the cathedral gates. I had no sooner quitted my carriage, than I found myself surrounded by a few humble but resolute citizens, who, far from 'jostling' or assaulting me, carried me into a house opposite the cathedral, where I and several other gentlemen were received with true Irish hospitality and kindness. It is wholly and most notoriously false to state, that I was concealed 'under a bed,' or concealed at all. I remained in a room, with upwards of 20 persons of both sexes; to that room the mayor, the high-sheriff, and many other persons had access, and can contradict the false assertion. It is equally false that a 'troop of dragoons with drawn swords,' rescued me from what is called 'my hiding-place.' When the excitement had somewhat subsided, and before any soldiers arrived, I crossed over to the cathedral with my friends, and entered my carriage without difficulty, or concealment; nor did I see a single soldier till I reached the bridge, where Colonel Mansel met and asked me whether I required any protection. I informed him that I did not, and returned to my hotel, without the slightest molestation." His Lordship then alludes to the political imputations cast on himself by the local papers, and says—"But I will not accept as judges of my political conduct an excited crowd, which could forget the reverence due to death, and the sympathy which every manly and generous spirit ought to have felt for a daughter and a widow attending the obsequies of a parent. From a tribunal like this no judgment can proceed to which I feel disposed to attach the slightest importance." The ladies here alluded to were Lady Glentworth and Lady Russell, the daughters of the deceased Earl, who attended the funeral. The last accounts state that the rioters attempted to upset the carriage of the ladies, threw dead dogs and cats at the hearse, and even attempted to throw it into the river. Notwithstanding Lord Monteagle's statement given above, they repeat that his Lordship was in imminent peril, and that the mob were clamorous in demanding "the life of the traitor that sold his country." The troops, it appears, were called out, but were not directed to act, the people having retired to their homes as soon as the funeral was concluded.

Cork.—During the late gales the Vanguard iron steamer ran ashore near Cork lighthouse. It was at first supposed that she would become a total wreck, but her iron construction was greatly in her favour, and last week she was successfully removed from the rocks.

The Provinces.—The list of agrarian outrages continues to increase. In Tipperary, at Terryglass, near Borrisokane, an attempt was made to murder a respectable farmer, named Cleary, on the 26th ult., almost in open day. The shot carried off three of his fingers, and inflicted other wounds, but it is believed that he will recover.—At Rathdowney, in Queen's County, a man named Dillon was murdered on the 20th, it is supposed by his own nephews.—On the same night, at Kennity, in King's County, a party of armed men entered the house of a farmer, called Mulhall, and would have murdered him but for the courageous conduct of his eldest daughter, who successfully defended her father, but had two fingers shot off in the struggle.—In Armagh, near Keady, the two daughters of a farmer named Hall, displayed equal courage and with the same success. They kept a party of 20 men at bay all the night, and though several shots were fired, no lives were lost. Their own brother was the leader of the party!—The report of the murder of Mr. Carden, of Barnane, is contradicted, but it appears to have arisen in consequence of an attempt made on the life of Sir Henry Carden, of the Priory. Sir Henry was passing through the street of Templemore, when he was knocked down by a blow of a stone; while down he was struck on the head by another ruffian, also with a stone; and, but for the exclamations of some children who were playing near the spot that "a man was murdering," there can be little doubt but Sir Henry would have been added to the list of persons whose lives have been sacrificed in Tipperary.—Some arrests have been made for the murder of the Sheppards, in King's County, and the parties committed to gaol for further investigation; but they were afterwards discharged, as no evidence could be produced against them, nor would they admit that they knew anything of the horrid tragedy. The authorities are making every exertion in their power; but, so well is the "secret system" managed, that at present almost all hopes of detection are vain, however great the rewards.

Theatricals.

DRURY LANE.—Her Majesty and Prince Albert, attended by a numerous suite, visited this theatre on Friday evening, to witness the performance of the pantomime of "Harlequin and Robinson Crusoe," with which they were highly entertained. In the course of the evening, a successful attempt was made to check the practice of publicly recognising the Queen whenever she ventures on a private visit to the theatre. When Her Majesty and Prince Albert entered their box, there was a call for "God save the Queen." The cry from the whole of a most crowded house was so imperative, that the orchestra were proceeding to obey it, when they were stopped by order of Mr. Bunn; who was determined to respect her Majesty's desire for privacy on the occasion. During the remainder of the evening, the audience, with equal good sense and loyalty, abstained from any overt recognition of Her Majesty's presence.—We may here mention that Mr. Balfe has returned to Paris, and is now engaged in the composition of another new opera, the libretto of which has been written by M. St. Georges, and forwarded to Mr. Bunn, for translation into English. The principal part is intended for Madame Thillon, whose engagement at Drury-Lane commences in May next. It is also said that an Italian opera by Mr. Balfe, entitled "Elfrida," will be brought out at Her Majesty's Theatre next season.

Miscellaneous.

Mesmerism.—The following humorous description of Mesmerism appears in Hood's Magazine for the present month. It is in the form of a letter from Eliza Passmore to Mary Smash, No. 1, Chaney-walk, Chelsea:—"Dear Mary, This cums hoping yure well, and to advize you to larn Mismerizing. Its dun with yure hands, and is as easy as taking sites at Pepel, or talking on yure fingers. If I was nigh you, I'd larn you in no time to make Passes, which is only pawing, like, without touchin, at someboddys face or back, witch gives them a tittevating feeling on the galvanic nerves. And then off they go into a Trance in a giffy, and talk in their sleep like Orators. I should say Oracles, and anser whatever you ax. Whereby you may get your Fortin told, and find out other fokes sweethearts and luve secrets, And diskiver Theaves better than by Bible & Key, And have yure inward Disorders told, & wats good for them. Sukey's was the indigestibles, and to take as much rubbub as would hide a shillin. All witch is done by means of the sombulist, that's the sleeper, seeing through every think quite transparent, in their Trance, as is called Clare Voying, so that they can pint out munny hid under the Erth, and burried bones, and springs of water, and vanes of mettle, and menny things besides. Yesterdy I was mismerized meeself into a trance, and clare voyed the chork gout in John's stomach as plane as Margit Cliffs. So I prescribed him to take collyflower, which by rites should have been collycinth, but I forgot the propper word. Howsumever, he did eat two large ones, and promises to cum round. It would make you split yure sides with laffin to see me mismerize our Thomas and make him go into all sorts of odd postures, and anticks, and capers, like a dotterel, for watever I do he must coppy, to the snapping of a finger, and cant object to nuthing, for, as the song says, I've got his will and his power. Likewise you can make the sombulist taste whatever you think proper, so I give him mismerized warter, witch, at my command, is transmoggrified on his pallet to Shampain, and makes him as drunk as Old Goosberry, and then he will jump Jim Crow, or go down on his bended knees and confess all his peckaddillos, witch is as diverten as reading the Misteries of Parris. The wust to mismerize is Reuben the Cotchman, not that hes too wakeful, for hes generally beery, And goes off like a shot, but he wont talk in his sleep, only snores. The Page is more passable and very clarevoying. He have twice seed a pot of goold in the middle flower-bed. But the gardner wont have it dug up. And he says theres a skelliton bricked into the stair-case wall, so that we never dares at nite to go up alone. Also he sees Visions and can profesy and have foretold two Earthquacks and a grate Pleg. Cook wants to mismerise too, but wat with her being so much at the fire and her full habbit, she always goes off to sleep afore the Sombulist. But Sukey can do it very well. Tho in great distress about Mrs. Hardin's babby witch Sukey offered to mismerize in loo of surrup of Poppies or Godfrey's Cordial, but the pore innocent wont wake up agin, nor havent for two hole days. As would be a real blessin to Muthers and Nusses in a modrate way, but mite be carried too far, and require a Crowners Quest. As yet thats the only Trial we have made out of the House, But we mean to mismerize the Baker, and get out of him who he really does mean to offer to, for he is quite a General Lover. Sum pepel is very dubbius about Mismerizing, and sum wont have it at any price; but Missis is for it, very strong, and says she means to believe every atom about it till sumboddy proves quite the reverse. She practises making passes every day, and is studying Frenology besides, for she says between the two you may play upon pepel's penny-craniums like a Piany, and put them into any Key you like. And of course her fust performance will be a Master piece on the Head of the Family. To be shure it seems a wonderful power to be give to one over ones Fellow Cretures, and as mite be turned to Divilish purposes But which I cant stop to pint out, for makin the beds. To tell the truth, with so much Mismerizing going on, our Wurks has got terrible behind hand And the carpits has not been swep for a week. So no more at present in haste from your luving Friend—ELIZA PASSMORE. P.S.—A most remarkable Profesy! The Page have fortold that the Monkey would some day bite Missis, & lo! and behold he have flone at her, and made his teeth meet in her left ear. If that aint profesying I dont know what is."

Improvement of Paris.—The *Journal des Débats* announces that a new residence and office for the Minister of Foreign Affairs is to be built in the grounds adjoining the Chamber of Deputies. The Bibliotheque du Roi is to be removed from the Rue de Richelieu, and a handsome building erected as the repository of this splendid collection on the site of the ancient Hotel Bouillon, which is situate on one of the quays on the Seine, opposite to the Tuileries. The Timbre Royale is to be removed from the Rue de la Paix, and a splendid new Opera House is to be built in the Rue Grange Batellière, on the site of the Mairie of the second arrondissement, to replace the temporary building in which the Academie Royale de Musique has been located since the death of the Duke of Berry in 1820. The estimate of the expense of all these splendid works is 19,200,000 francs; but the sites of the present Royal Library and Office of Foreign Affairs are to be sold for building purposes, and it will give an idea of the immense value of land in some parts of Paris, when we state that the value of the mere sites of the buildings to be abandoned is reckoned at 17,200,000 francs, so that the real expenditure for which the treasury will be called upon to pay for all these splendid works is not above 2,000,000 francs.

BIRTHS.—On Christmas-day, at Woolwich, the lady of Captain MITCHELL, Royal Artillery, of a daughter—27th ult., at the Rectory, Donington-on-Bain, Lincolnshire, the lady of the Rev. A. PATON, M.A., of a son—27th ult., the lady of the Rev. T. A. HOUBLON, of a daughter—27th ult., at Buckland Court, near Reigate, the lady of the Rev. H. S. BYAM, of twin sons—27th ult., at Newick, in the county of Sussex, the lady of J. H. HURDIS, Esq., of a son, still-born.

MARRIAGES.—On the 21st ult., at St. Botolph's, Aldersgate-street, W. M. JONES, Esq., of Prospect House, Sudbury, to ISABELLA J. PENRIEL, eldest daughter of J. Penriel, Esq., architect, of Colchester—26th ult., at St. Pancras New Church, F. PARKER, Esq., of Masbro', to ALICE ROE, youngest daughter of the late R. Roe, Esq., Bakewell.

DEATHS—On the 10th ult., at Adrianople, J. KERR, Esq., Her Britannic Majesty's Consul at that city, and nephew of the late Niven Kerr—26th ult., at her residence, Cheltenham, MARIAN IMPEY, youngest daughter of the late Sir Elijah Impey, Chief Justice of Bengal, &c.—20th ult., at Stoke Devonport, H. COX, Esq., aged 68—23d ult., at Clifton, ELIZ. CLARKE, wife of the Rev. W. T. CLARKE, aged 33—24th ult., at Glasgow, AGNES NOBLE, the wife of C. H. Noble, Esq., of Oporto.

WANTED—In a small Establishment, where Orchidaceous, Stove, and Greenhouse Plants are grown, and where Propagating and Hybridising, &c., are carried on with much care, an Intelligent Young Man, who has had opportunities of assisting in these different departments, and who has a fair share of practical knowledge. There is a second man in the gardens. The Wages are 25*l.* per annum, with board and lodging; and practical works on Gardening are given as premiums for successful cultivation and good conduct, with access to the publications of the day on Horticultural subjects. None need apply who cannot offer the most unexceptionable references.—Apply by letter (post paid), to T. INGLE, M.D., La Hague House, Jersey.

WANTED, as UNDER-GAMEKEEPER.—Active, North Countryman, who thoroughly understands the Trapping of Vermin, &c., and can be highly recommended for sobriety, honesty, activity, &c &c. Wages, 14*s.* per week, with cottage.—Apply, with full particulars (prepaid), to C. B., Post-office, Wesbury, Wiltshire.

TO AGRICULTURISTS, HORTICULTURISTS, &c

WANTED—A Gentleman fully competent to conduct the Editorial department of a Weekly Agricultural Newspaper; also a Gentleman to conduct the Horticultural and Floricultural branches of the same Journal. As a liberal salary will be given to parties FULLY COMPETENT, none other need apply.—Direct, post paid, A. B., at the Irish Letter Foundry, 13, Lower Liffey-street, Dublin.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A steady, active, married Man, aged 35, who thoroughly understands the Hothouse and Greenhouse, Kitchen and Flower Garden, and the Laying out of Ground. Can have an unexceptionable character from his last situation.—Direct to A. B., No. 12, Prospect-row, Barnsbury Pond, Islington.

AS GARDENER.—A strong, active young Man wishes for a Situation as above, or in a Nursery. He fully understands Propagation and the management of Stove and Greenhouse Plants, Flower and Kitchen Gardening in all its branches; also the management of a Seed Shop. Can produce testimonials of good character and ability, and has served seven years in the trade.—Direct to WILLIAM LOMBY, Woodbine Cottage, North End, Hampstead.

TO PARENTS AND GUARDIANS.

A SITUATION offering peculiar advantages to a young Man wishing to learn the Norfolk system of Farming, may be heard of on application to Mr. R. B. HARVEY, Putnam, near Harleston, Norfolk. A youth who has just left school would be preferred.

The Newspaper.

SATURDAY, JANUARY 11, 1845.

ARGUS LIFE ASSURANCE COMPANY,
39, Throgmorton-street, Bank.
Empowered by special Act of Parliament, 5 & 6 Will. IV. c. 76.
Thomas Farncomb, Esq. Alderman, *Chairman*.
William Leaf, Esq. *Deputy Chairman*.

Richard E. Arden, Esq.	J. Humphery, Esq. Ald. M.P.
William Banbury, Esq.	Rupert Ingleby, Esq.
Edward Bates, Esq.	Thomas Kelly, Esq. Ald.
Thomas Camplin, Esq.	Jeremiah Pilcher, Esq.
James Clift, Esq.	Lewis Pocock, Esq.

Physician—Dr. Jeaffreson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq. 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.
Advantages of the Argus Life Assurance Company.
Low Rates of Premiums.
In addition to the subscribed Capital of 300,000*l.* the assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and an accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company.
The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits

Annual Premium to Assure 100*l.*

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 19 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.
In Assurances for advances of money, as security for debts, or for a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus Office will be found to be particularly favourable to the assured.
A Board of Directors, with the Medical Officers, attend daily, a quarter before 2 o'clock.
EDWARD BATES, Resident Director.
A Liberal Commission to Solicitors and Agents.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, WATERLOO PLACE, PALL MALL, LONDON.
George Chisholm, *Chairman*. W. Morley, Esq., *Dep. Chairman*.
GREAT ADVANTAGES OFFERED TO POLICY-HOLDERS BY THIS INSTITUTION.
A large and immediate accession of Assurances, by the transfer of the Policies of the "Achilles British and Foreign Life Assurance Association."
PROFITS.
The whole of the Profits divided ANNUALLY among the Members, after payment of five Annual Premiums.
An ample guaranteed Capital, in addition to the Fund continually accumulating from Premiums *fully sufficient* to afford complete security.
CREDIT.
Credit given to Members for half the amount of the first five Annual Premiums, without security.
Credit allowed to Members for the whole of the first five Annual Premiums, on satisfactory security being given for their payment.
Transfers of Policies effected and registered (without charge) at the Office.
Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Members.
Loans granted upon approved Security.
An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying up the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.
Extract from the Reduced Scale of Rates, for an Assurance of 100*l.*

AGE.	ANNUAL PREMIUM. ONE YEAR.	SEVEN YEARS.	WHOLE LIFE.
	£. s. d.	£. s. d.	£. s. d.
20	1 0 9	1 1 6	1 13 11
30	1 2 9	1 3 3	2 2 1
40	1 5 6	1 7 6	2 16 4
50	1 15 9	2 1 6	4 1 11
60	3 3 5	3 17 0	6 8 3

Full particulars are detailed in the Prospectus.
A. R. IRVINE, Managing Director.

NATIONAL ASSURANCE AND INVESTMENT ASSOCIATION, No. 4, Lancaster-place, Strand, London.
ASSURANCE DEPARTMENT.—Policyholders for the whole of life are entitled to the whole profits.
For Investment, shares are issued of £5; also reduced shares of £2., designed to enable provident persons to improve savings.
The Prospectus, &c., Form of Application for persons desirous of becoming agents, and all necessary information may be obtained at the Offices of the Association.
WILLIAM CLARKE, General Actuary.

METROPOLITAN LOAN COMPANY.
ESTABLISHED, 1839.
Offices, No. 1, Craven Street, Strand, London. Open from Eleven till Three o'clock daily.
Loans are advanced by the Company on the security of two responsible housekeepers, in sums of 10*l.* 10*s.*, 15*l.*, 20*l.*, 25*l.*, 30*l.*, 35*l.*, 40*l.*, 45*l.*, and 50*l.*, for periods of twenty-five weeks, at 2½ per cent, or of fifty weeks, at 5 per cent., at the option of the borrowers, to be repaid by weekly instalments. If the securities are approved by the Directors at their weekly meeting, the loans are immediately advanced. Amounts exceeding 50*l.* are advanced by special agreement with the Directors.
Forms of application, containing the rules and regulations, may be had at any hour of the day, price 2*d.*

News of the Week.

THE Revenue returns for the year and quarter ending on Saturday last have been published this week. They exhibit a considerable increase for both periods, and on almost every item of receipt. They are also remarkable as showing, for the first time since 1837, an excess of income over expenditure which may be traced directly to an increased activity and extension of the trade and commerce of the country. The total increase on the year is 1,163,595*l.*; that on the quarter is 493,916*l.* With the exception of the doubtful branch of revenue entered as "Miscellaneous," the only item of the ordinary revenue which exhibits a small decline is the Income-tax, which has decreased 57,664*l.* on the year probably in consequence of the repayment of over-charges; it has, however, recovered itself on the quarter, showing for the three months an increase of 33,126*l.* The Customs show an increase in the year of 1,305,453*l.*, and the Excise of 365,304*l.*; while on the quarter the same important branches show an increase respectively of 135,167*l.* and 200,169*l.* The other departments which are looked upon as in some measure a test of the prosperity or depression of the mass of the people exhibit a corresponding improvement. The Post-Office also shows a steady progress in the right direction, the increase on the year being 83,000*l.*, and on the quarter 3000*l.* But for the decrease in the two items of Income-tax and Miscellaneous, the absolute increase on the year would have reached the large sum of 2,162,370*l.*

From France we learn that the Ministerial crisis which had caused such a panic last week has passed over for the present; but the position of parties is so incomprehensible, that no one can venture to predict what may be the ultimate effect of the late events upon the stability of the Cabinet. The King, it appears, has disavowed all participation in the late intrigue, and has given M. Guizot fresh assurances of his confidence. This declaration has been the means of recalling the Ministerial deserters to their allegiance, and unless some new combination should arise, for which the Government are unprepared, it is not unlikely that they will have a majority on the Address. The result of this debate, which will of course constitute the first great struggle of the Chambers, will give the best indication of the state of parties, and will show whether the Ministry can maintain their ground throughout the Session. In the event of a dissolution, there is no doubt that Count Molé will be the new Prime Minister; and as it is said that he has obtained the support of M. Thiers, a coalition Ministry will probably be formed by those statesmen. Admiral Dupetit Thouars arrived in Paris a few days since from the Pacific. The Admiral is said to be displeased with the disavowal of his Tahiti conquest, but nevertheless refuses to identify himself with the ultra-republicans, or to accept the sword of honour, which was lately made the subject of such hostile manifestations by that party.—From Spain there is no news of any interest. The disagreements of the Ministers with the nineteen members of the Chamber of Deputies who have resigned their seats in that Assembly, constitute the chief topics of the papers. — From Italy we learn that the negotiations of the British Cabinet for a *concordat* with the Pope have caused much excitement in Rome, where it is feared that the Irish Catholics may renounce the Pontifical authority. There is no doubt that the Pope, at the desire of our Ministry, has addressed a letter to the Irish Prelates, enjoining them not to meddle in political affairs, and to preach to their flocks obedience to the British Government. It is also believed that the negotiations for a *concordat* are in active progress, and that the Cabinet will bring forward in the next session various measures which will effect a more intimate connection between the Roman Catholic Church in Ireland and the State.—By late advices from New York, we learn that the House of Representatives has passed the early stages of a Bill for providing military posts in the Oregon territory, on the plans suggested in the President's Message. This intelligence can hardly fail to excite surprise in England, and must necessarily attract the immediate attention of our Government. The reception of the Bill was not accomplished without a division upon the motion to suspend the rules, the result of which was a majority of 76 in its favour. The Bill was ultimately read a first and second time, and referred to the Committee on Territories. It is evident, therefore, that the measure will receive the final sanction of the House, but the reception it will encounter in the Senate will probably be of an entirely opposite nature.

Home News.

COURT.—Her Majesty and Prince Albert have taken their usual walks during the week in the grounds of the Castle, and have occasionally taken horse exercise in the riding-school. On Sunday the Queen and Court attended Divine service in the private chapel of the Castle. Her Majesty and the Prince will leave Windsor for Stowe, on a visit to the Duke of Buckingham, on Wednesday next. It is stated that Her Majesty, with her accustomed generosity, has given, out of her privy purse, the sum of 1000*l.* a year to Sir Augustus D'Este, which is equal to the sum Sir Augustus lost by the death of the Duke of Sussex. The visitors to Her Majesty this week have been the Earl of Aberdeen, the Earl of Liverpool, the Earl and Countess Delawarr and Lady Mary West, Viscount Melbourne, Lord and Lady Beauvale, Captain Meynell, Mr. Barnard, Her Majesty's Chargé d'Affairs at Coburg, the new Austrian Ambassador, Count Dietrichstein, and the Countess Dietrichstein, Mr. Fraser Tytler, the Marquis and Marchioness of Exeter, the Duke of Sotomayor, the new Spanish Minister, and the Duchess of Sotomayor, Lord and Lady Cottenham, and the Right Hon. W. E. Gladstone. Capt. the Hon. A. Duncombe has succeeded Major-Gen. Sir F. Stovin as Groom in waiting on the Queen. Since the retirement of the Hon. C. A. Murray, Master of the Household, Capt. Meynell, R.N., has undertaken, by the Queen's desire, the temporary performance of his duties.

Order of St. Patrick.—The Lord Lieutenant of Ireland, as Grand Master of this Order, held a chapter on Monday at Dublin Castle, when the Earl of Rosse and the Marquis of Waterford, having received the honour of knighthood, were admitted as Knights of the Order, with the usual formalities.

Parliamentary Movements.—A vacancy in the representation of the Elgin district of burghs, by the retirement of Sir Andrew Leith Hay, being anticipated, requisitions have been got up in all the burghs, by the Conservative party, in favour of Mr. Duff, of Haddo, and it is understood that that gentleman has consented to stand. It is also reported that a canvass is going on in Peterhead, &c., on the Liberal side, for Lord Kilmarnock, eldest son of the Earl of Errol.

Diplomatic Changes.—Mr. Everett, the present Minister of the United States to our Court, is expected to leave this country early in the spring for Washington. Mr. Rives, the present Secretary of Legation, will be accredited as Chargé d'Affaires, if the successor of Mr. Everett should not arrive before his departure for America.

The Colonies.—It is reported that Her Majesty has been pleased to appoint Sir Henry Pottinger Governor-General of Canada, in the place of Sir Charles Metcalfe, who is seriously indisposed.

Cabinet Council.—A Council was held on Thursday, which was numerously attended, several of the Ministers having come to town for the purpose. The Council sat three hours.

Post Office.—It is stated that the Peninsular and Oriental Company have signed the contract with Government for the conveyance of the mails to India from Southampton twice a month in future, and that the Great Liverpool will be sent out with a mail on the 20th inst. It is also stated, that Messrs. H. and C. Toulmin, in addition to their contract for the conveyance of the mails to Sydney, have completed arrangements with the Government for the transmission of the return mails to this country, thus establishing a regular monthly communication both ways. The Postmaster-general has given notice to all postmasters and letter-receivers, directing that from the 1st of this month, should any letter or packet be tendered at their office, which they may ascertain to contain, or which they have every reason to believe contains any of the following articles, viz. any glass or glass bottle, any razor, scissors, knife, fork, or other sharp instrument; any leeches, game, fish, flesh, fruit, vegetables, or other perishable substance; any bladder or other vessel containing liquid; or any article, matter or thing whatsoever which might, by pressure or otherwise, be rendered injurious either to the officers of the post-office, or to the contents of the mail-bags, they will refuse to receive such letter or packet. In the event of any letter or packet being taken by postmasters, and their not until afterwards discovering that it contains any article as above described, or should any such letter or packet be deposited in the letter-box, they are not to forward it to its destination, but detain it in the office, and inform the Secretary of the General Post-office by the first post of the circumstance, in order that proper steps may be taken by the chief office in disposing of it.

The Revenue.—The Revenue returns for the year and quarter ended Jan. 5, were published on Monday. The total revenue for the YEAR is 51,235,538*l.*, being an increase as compared with the preceding year, of 1,163,595*l.* There is an *increase* in the Customs of 1,305,453*l.*; Excise, 365,304*l.*; Stamps, 185,235*l.*; Taxes, 26,002*l.*; Post-Office, 83,000*l.*; Crown Lands, 37,500*l.*; to which must be added Imprest and other moneys, 109,610*l.*; Repayments of Advances, 50,266*l.*; making a total of 2,162,370*l.* There is a *decrease* in the Income-Tax of 57,664*l.*; Miscellaneous, 941,111*l.*; making together, 998,775*l.*, which being deducted from the sum of 2,162,370*l.*, gives as above an increase on the year, of 1,163,595*l.* The total revenue for the QUARTER is 12,705,693*l.*, being an increase on the preceding quarter of 493,916*l.* There is an *increase* in the Customs of 135,167*l.*; Excise, 200,169*l.*; Stamps, 78,005*l.*; Taxes, 11,633*l.*; Income-Tax, 33,126*l.*; Post-Office, 3000*l.*; Crown Lands, 20,000*l.*; to which must be added Imprest and other moneys, 96,623*l.*, making a total of 577,723*l.* There is a *decrease* in Miscellaneous of 2727*l.*, and in Repayments of Advances, 81,060*l.*; making together 83,807*l.*, which being deducted from the sum of 577,723*l.*, gives as above a total increase on the quarter of 493,916*l.*

Foreign.

FRANCE.—The Ministerial crisis which threatened last week the existence of the Guizot Cabinet has passed as unexpectedly as it arose, and the Government may be considered to have escaped dissolution, at all events for a time. Their position however is extremely insecure in the present state of parties, and no one can predict what new event any hour may produce to derange their policy. In the event of a change in the Cabinet, there is no doubt, as we stated last week, that Count Molé will

be intrusted with the formation of a new Ministry, and that he will be joined by the parties of M. Thiers, of M. Dufaure, and of M. Odillon Barrot. This combination is said to have the full sanction of M. Thiers, who has intimated to Count Molé that he may reckon upon his support and that of his friends. It is a very formidable combination, and it is considered next to impossible that the Cabinet can withstand it for the whole session, even if it should carry a small majority on the address. The late defection of certain deputies who usually support the Cabinet has been traced not to the intrigues of the Court but to the enmity of Count Montalivet, who had sufficient influence to deprive Ministers of their support. M. Guizot was not aware of this intention and was therefore unprepared to meet it, but the small majority by which M. de Belleyme was elected Vice-President of the Chamber of deputies, convinced M. Guizot that the moment had arrived for putting an end to the doubts of the King's support of him, which had been openly expressed in the Chamber. He accordingly waited on His Majesty, and begged to be favoured with an assurance of a continuance of the King's support, or His Majesty's acceptance of his resignation of office. The King declared that his confidence in him remained undiminished. M. Guizot asked then—would His Majesty prove it openly? The King replied in the affirmative, and accordingly on Tuesday evening, when the newly-elected officers of the Chamber presented themselves to him to pay their respects, His Majesty expressed his regret to M. De Belleyme, that his majority was not larger, adding that "those who believed that such a wish as that Ministers be defeated had been uttered by him, were enacting the part of dupes." His Majesty also addressed the Count d'Argout, who was Minister of the Interior under M. Thiers, and is at present Governor of the Bank of France, and said, "You have been Minister, Count d'Argout, and you know that when I have occasion to complain of my Ministers I separate myself from them, but I do not carry on any underhand intrigues." It appears that in the nine bureaux, or sections into which the Chamber is divided, very animated debating took place ere they proceeded to elect each one member towards the formation of the committee on the address; but the ballot proved that Ministers had succeeded in recalling the deserters to their allegiance. Only one (M. Gaultier de Rumilly) out of the nine elected can fairly be deemed an Oppositionist. M. St. Marc Girardin, elected by the 7th bureau, is a Conservative, a Professor at the University, and one of the editors of the *Journal des Débats*. The remaining seven chosen are staunch Ministerialists. It appears moreover that the aggregate relative numbers of the votes of each party were—Ministerialists, 194; Opposition, 138; thus giving a majority for Ministers of 56.—The committee of the Chamber of Peers appointed to draw up the address met on Friday, at the Palace of the Luxembourg, to hear the explanation demanded of the Ministers of War, Foreign Affairs, Finance, and Marine. The committee of the Chamber of Deputies also assembled on the same day, under the presidency of M. Sauzet, and commenced the general discussion on the address. On Saturday and on Monday the latter again met and held conferences with the Ministers of War and Foreign Affairs, but the explanations of the Cabinet will be given in so much greater detail during the debate on the Address, that we reserve our notice of them until then.—The *Presse* states, upon the authority of the physician who attends M. Villemain, that he daily improves in health, and the *Constitutionnel* affirms, that the melancholy illness of the Minister is attributed to anonymous letters sent to him, threatening to accuse him of having prematurely and unnecessarily confined his wife in a lunatic asylum, if he did not cease to oppose the Church on the subject of education. These letters are attributed to the Jesuits. Anonymous letters, containing the most diabolical threats, are also said to have been sent to M. Cousin and M. Dupin, and some other influential members of the Chamber of Deputies, who have taken an active part in favour of the University; but fortunately they have not had such fatal consequences as in the case of M. Villemain. The *Constitutionnel*, after describing the Minister's character as a compound of fine qualities of feeling and intelligence, with indecision of purpose, says:—"But a remarkable and well-attested fact is the quantity of anonymous letters with which he was overwhelmed at the approach of the session. The pious authors of these letters (all of which conclude in favour of the Jesuits) had conceived the most odious and cruel means of acting on his mind. They threatened him, if he did not deliver public instruction into the hands of the adversaries of the University, to denounce him to the public as having caused a sick person most dear to him to be sequestered without just cause, and without accomplishing the legal formalities. This accusation was absurd, but it touched a bleeding wound in M. Villemain's soul; it troubled him profoundly, and the persistance of his anonymous enemies led him to fear seriously that his domestic afflictions would serve as the aliment of a series of violent attacks. We do not mean to deny that an excess of labour, a solitary and monotonous life, and physical suffering, may not have been the principal causes of his temporary loss of reason; but it is not the less certain that the calumny of which we have spoken had become the constant and fatal occupation of his thoughts. There are not wanting persons who already repeat to their stupid circle, that the Ministry has been struck by the anger of God, for not having drawn up a Bill favourable to the Jesuits. These folks know what they say, for it is they who themselves partly effect the miracle."—The *Commerce* announces that the French Ministry has concluded a second treaty of commerce with the Belgian Government. The object of this treaty is to extend the period for admitting Belgian linen-cloth and thread into France at a reduced duty, the existing treaty having but two years to run.—It appears that Admiral Dupetit Thouars had not yet had any communication with the Opposition party, although two days in Paris. He has kept himself quiet since his return to Paris; but he is said by his friends not to be altogether pleased with the disavowal of his Tahiti conquest by the Government. He has, however, intimated his refusal of the sword of honour, for which some hundred pounds was raised by "a national subscription," and does not otherwise appear to mix himself up with the political part of the affair.—The *Moniteur* states that the keeper of the seals has, by a Ministerial order, dispensed with the fees of his office on the occasion of the elevation of Marshal Bugeaud to the dignity of duke. It is understood that the duke positively refused to pay the fees. He is said to have declared that "if France was rich enough to pay for her glory, she was also rich enough to pay for the honours which she bestowed." The Government did not choose to enter into a controversy on the subject, and hence the order dispensing with the fees, amounting to 18,000f.—M. Glais-Bizoin has placed on the table of the Chamber of Deputies, a petition, signed by a great number of the inhabitants of Paris, praying for a moderate uniform postage on letters; a reduction of one-half of the tax of five per cent. at present levied on money orders, and subsidiarily the annullation of the duty of 35c. on orders of 50f. and under; the suppression of the rural decime; the reciprocity of 20c. for letters written by soldiers and sailors to their families in France; and the cessation of the delay of 12 hours for letters, which in passing through Paris, remain there from six in the morning until the same hour in the evening.

SPAIN.—We have accounts from Madrid of the 30th ult. The Senate had rejected the Duke de Gor's amendment on the constitutional reform for an hereditary peerage, but the question was to be brought forward again in a different form. The report of the committee on the slave trade was read, and was favourable to the Government measure. Another discussion on the Constitutional Reform Bill had taken place in the Senate, but had presented no interest. The Minister of Finance, M. Mon, has tendered his resignation to the Queen, in consequence of the altercation which has induced the Marquis de Viluma and sixteen other members to resign their seats in the Chamber of Deputies; and the Ministers of the Interior and of Justice are said to have followed his example.—Letters from Gibraltar state that the Moors in the neighbourhood of Ceuta have shown a serious disposition to resist the execution of the treaty entered into between Spain and the Emperor. They have destroyed the piles put down to mark the new boundary, and have threatened to attack the Spaniards sent to replace them. The Emperor has sent some troops to prevent these excesses, but hitherto they have not succeeded in quieting the people, who are exasperated that additional territory should be given to Spain.

PORTUGAL.—Accounts from Lisbon of the 31st mention the elevation of the two ministers, Cabral and Castro, to the dignity of the peerage, and the creation of six other peers of their party. The Chambers were to open on the 2d inst. The rage for the formation of capitalist companies still continues. A new company, with a capital, on paper, of 20,000 contos, upwards of four millions and a half sterling, had sprung up in one day, and gone through all the stages of its incorporation in twenty-four hours after the submission of the project to the Sovereign. It is feared that these speculations arise too much out of emergencies in the money market, and others of a political kind, to afford indications of a healthy state of things either in finances or politics.—Zurbano was said to have been in Portugal, and to have found means of leaving that country.—The annual return from the Oporto Custom-house of the total shipments of Port wine during the past year, shows that they amounted to 33,946 pipes—viz., to Great Britain and Ireland, 25,492; United States, 3278; Brazil, 1943; Hamburgh, 919; Calcutta and Hong-Kong, 716; Denmark, Sweden, and Norway, 290; Quebec and Montreal, 225; Halifax, 212; Holland, 162; Newfoundland, 109; Russia, 95; Prussia, 67; France, 6; Portuguese settlements, &c., 432—total 33,946 pipes. The ten largest shippers were—G. Sandeman and Co., 3522 pipes; Quarles Harris and Co., 1958; Oporto Wine Company, 1593; Martinez, Gassiot, and Co., 1468; A. J. d'Oliveira Basto, 1307; Hunt, Roope, Teage and Co., 1238; Croft and Co., 1147; T. J. Smith, 1080; Allen, Morgan, and Co., 1035; Offley, Webber, and Forrester, 1011. All other shippers figured under 1000 pipes each.

GERMANY.—Accounts from Berlin state that the diminution of the postage on letters has already produced the most satisfactory results, and it has been necessary to increase considerably the number of postmen. The King had received at Sans Souci a deputation from the peasants who live on the estates of the Prince of Biron, and who pray for the abolition of statute labour. His Majesty promised to pay attention to their demand. An old man in Silesia has addressed a petition to His Majesty, in which he says that he is much afflicted at bearing the same name as the assassin Tchesch, with whom he cannot discover that he is in any way related; he is indeed old, but he has sons, and he begs His Majesty to give him another name. The King immediately wrote on the petition—"The petitioner's request is granted; he shall be called Echt."—Anne Louis Cretien Duc de Montmorency, Grandee of Spain of the first class, Knight of the French Legion of Honour, died at Munich, on the 21st ult., at the age of 75. He was a faithful adherent of the exiled Royal Family of France, and had resided for more than ten years at Munich, where he made many friends, though he lived in a very retired manner. He was father of Prince Montmorency Robecq, who was condemned a few weeks ago by the Correctional Tribunal of Paris for having sold busts of the Duke of Bordeaux.

ITALY.—The French papers publish the following extract from a letter dated Leghorn, the 30th ult.:—"According to letters from Rome the British Government has at length obtained from the Pope the letter which it desired to be addressed to the Primate and Catholic Bishops of Ireland. In this letter Gregory XVI. commands the Irish Bishops not to meddle in political affairs; and, moreover, to preach to their flocks obedience to the British Government. The British Ministry, in order to obtain this concession, is said to have threatened the Court of Rome that they would excite a revolt in the Papal States, where the elements of revolution are warm. For that reason the Pope preferred his temporal to his spiritual interests, and has reprimanded the Irish, as in the year 1832 he reprimanded the Poles who rose in insurrection against Russia. This intelligence has made a bad impression even at Rome, where it is feared that the Irish Catholics may publish a declaration against the Pontifical authority."—A letter from Rome, Dec. 23, states that the furniture of the apartment in the Palazzo Barberini, occupied by the late Thorwaldsen, has just been sold, as well as all the tools and articles of his studio. The latter objects were purchased in general by Englishmen, at exorbitant prices. Three common chisels fetched 85, 92, and 110 Roman crowns (17*l*., 19*l*., and 23*l*.)

GREECE.—Letters from Athens of the 21st ult. state that M. Mavrocordato had little chance of upsetting the Coletti Administration, although supported by the united efforts of the British and Russian Ministers. The King had conferred the Grand Cordon of the Order of the Saviour on M. Mavrocordato, but M. Coletti still continued to enjoy his favour, and was likewise popular with the nation generally.

SWITZERLAND.—The Government of Glaris has resolved not to reply to the communication of the Government of Lucerne, announcing the victory obtained over the revolters on the 8th of December, and the Lower Council of Argau had refused to institute criminal proceedings against the volunteers who had participated in the insurrection on that day. It had, moreover, notified its resolution to the Government of Lucerne, and to all the cantons. The Grand Council of Lucerne was convoked on the 3d inst. to deliberate on the demand of Zurich respecting the expulsion of the Jesuits.

SWEDEN.—The Stockholm papers of the 24th mention an act of injustice done to a foreigner 20 years ago, whose claims on the State have been officially recognised more than once. This is the claim of a Pomeranian captain, which was acknowledged in 1682, at the sum of 33,000 dollars in silver, which, with the interest, would now amount to 1,000,000 dollars. His Majesty has now referred the heirs to the competent tribunal, to decide on the matter.

INDIA AND CHINA.—The following are further details of the news brought last week by the overland mail from Bombay, and by the intermediate one from Calcutta. The intelligence, with the exception of the disturbances in the Southern Mahratta country, is of a pacific character. Since the fall of Samunghur, our troops have taken possession of the fort of Badurghur, after but a slight resistance. Colonel Outram had been superseded in the office of Political Agent by Col. Ovans, the President at Sattarah. The latter, while on his way to assume the duties of his new office, had been waylaid by the insurgents, and was at the time of the despatch still in their hands, but it appears in every way kindly treated. A force had been despatched for his release, but nothing further had transpired of their movements. The small territory adjoining the scene of the present disturbances, called Sawunt Warree, the inhabitants of which have been long famed for their turbulence, have likewise come into the field, and are likely to occasion us equal trouble. Cholera appears to be raging among the troops in this quarter to a very alarming extent. Two officers and numbers of the European soldiers have already fallen from its effects. The condition of Scinde continues deficient in interest, although there is a great increase of sickness among a portion of the troops, which has been severely felt at Sukkur and Shikarpore. Her Majesty's 78th had only 70 men fit for duty, while 700 of them were in hospital. At Shikarpore between 700 and 800 were in hospital, while at the small post of Khangur there were 100, and the convalescents slowly recovering. The accounts from Affghanistan are still little to be depended on. A report prevailed of the death of the King of Bokhara from the plague, which was devastating the countries around Cabool. The affairs of the Punjaub remain quiet in comparison to former accounts, but it is not likely that this will long continue. India otherwise was very peaceable. The accounts from China reach to the 12th Oct., but remain deficient in interest. The American Minister, Mr. Cushing, having terminated his negotiations with Keying, had taken his departure, and the French Minister had come forward in order to negotiate in his turn at Macao. Mr. Davis, the Governor of Hong-Kong, had gone on a voyage of superintendence to the northern ports. The Supreme Court of that colony had been opened, and a criminal session held.

CAPE OF GOOD HOPE.—We have accounts from the Cape of Good Hope to the 9th Nov., brought by H.M.S. Isis, arrived at Portsmouth. The papers state that the revenue of the colony will be much increased by the discovery of a guano island in the neighbourhood of Saldanha Bay, which, being within the limits of the British Government, had been claimed by our representative, and licences were to be granted for loading vessels at the rate of 1*l.* sterling per ton. The Isis had been round to Ichaboe, where she made a short stay while Sir J. Marshall arranged a code of regulations for the future management of the affairs of the island, which are stated to have given every satisfaction. The Isis, on her departure, was relieved by the Thunderer. The latest accounts from the eastern province of the Cape was, that plenteous rains had fallen, which, while generally supplying the wants of the neighbourhood by filling the rivers and creeks, gave the crops such nourishment that they presented a promising appearance.

UNITED STATES.—By the sailing packet St. Patrick we have advices of rather later date from the United States, containing the Annual Message of the Secretary of the Treasury. We learn, from the proceedings in Congress on the 16th, that the agitation of the Oregon territory question has again commenced. The House of Representatives has suspended the ordinary rules, in order to permit Mr. Duncan to introduce a bill for the extension of the United States jurisdiction over the Oregon territory. Objections were started to the introduction of the bill, and a division took place on a motion to suspend the rules, and the votes stood 129 against 53. Accordingly the rules were suspended, and the bill reported, and read a first and second time, and referred over to the Territories Committee. The abuses and frauds perpetrated at the last Presidential election, as we have before stated, had attracted general attention to the subject of the naturalisation laws, and we observe that preliminary steps to procure an extension of the term of probationary residence required of foreigners previous to their being allowed the privilege of citizenship, and also to improve the operation of those laws, had been taken in both branches of Congress. —The accounts from Mexico are confined to confused and contradictory statements of the progress of disaffection towards the government of Santa Anna.—A General Convention of the Episcopal Church of the United States had been recently held in Philadelphia. The subject of Tractarianism and the doctrines of Dr. Pusey having been favourably received and countenanced by several clerical and lay members of the Church in the country, gave rise to a very warm and animated debate, which lasted nearly a week. Several voluminous resolutions of censure were proposed; but eventually the Convention refused to interfere, declaring itself to have ample means to enforce discipline, and not to be responsible for "individual errors." The "House of Bishops" in their Pastoral Letter, read at the close of the Convention, referred to the same subject, and censured the doctrines of Tractarianism, and all doctrines and practices which seemed to be kindred with what the Protestant Church considered to be the errors of the Church of Rome. A candidate for the Bishopric of Mississippi was objected to, on the ground of certain pecuniary speculations which were supposed to affect his moral conduct. Finally, however, he was acquitted of any wrong intention; and his testimonials were referred back to his diocesan Convention, to be brought forward at some future day. Not the least remarkable incident of the meeting is, that the Right Rev. Dr. Onderdonk, Bishop of Pennsylvania, was "suspended," or virtually excommunicated, on charges of intemperance, to which he pleaded guilty.

WEST INDIES.—By the Forth royal mail steamer we have advices from Jamaica of Dec. 8th, Trinidad the 3d, Barbadoes the 7th, and the other West India islands of relative dates. In Jamaica the bill for providing means for securing the immigration of Hill Coolies was passed through committee on the 6th Dec., and in it all necessary arrangements are said to be embodied. A fund of 50,000*l.* had been appropriated for this object, and, in addition, authority is given to the Commissioners of Public Accounts to issue Exchequer-bills for the amount required, in case the Home Government should ship 3000 Coolies more than those expected. The weather is described as having been extremely favourable for the crops. A model sugar farm is likely to be established, under the care and direction of the Jamaica Royal Agricultural Society. The St. Ann's Agricultural Society also proposes the establishment of a model farm. The revenue of the Bahamas is stated, for the quarter ending the 30th of September last, at 5739*l.* 5*s.* 8*d.*, the expenditure at 6915*l.* 12*s.* 11*d.*

SOUTH AMERICA.—By the Crane packet, from the Brazils, we have advices from Rio to the 26th November. There is no news of importance by this conveyance, matters remaining *in statu quo* at the seat of Government. At Maceio there had been some outbreak of the ordinary character, to check which, a new President, Senor Lopez Gama, and a considerable number of troops had been despatched, with a corvette, two brigantines, and two steamers, and it was expected that the province would be speedily pacified. The English brig, John Dalton, from Sydney, was driven ashore in a gale of wind, on Cape Negro, the 16th Nov.; her mails which were transmitted to Rio, are brought to England by the Crane. H.M.S. Frolic, Viper, and Spider were ordered to render assistance, and by the latest accounts the vessel was expected to be got off with little damage. A lady passenger, reported to be called Stevens or Stevenson, had been unfortunately drowned. The dates by the Crane from Buenos Ayres are to the 30th Oct. Admiral Brown was there, whilst some of his vessels were blockading Monte Video, which was holding out boldly, and it was said that the Monte Videans would tire out the besieging forces. It appears that the American Commodore only kept possession of the Buenos Ayrean squadron for a few hours, but he detained a vessel which did not properly belong to Rosas, though she was fitted out by Oribe.

CITY.

Money Market, Friday.—Consols for the account closed at 100⅜; Red. Three per Cents., 100⅞; New Three and a Quarter per Cents., 104¼; Bank Stock, 211¾; Exchequer Bills, 63 to 65 pm.; India Bonds, 77 to 78 pm.

GAZETTE OF THE WEEK—BANKRUPTS—W. YOULE, Addle-st., Wood-street, commission agent—T. CHANDLER, Bow lane, builder—J. MANDANO, Grove street, Hackney, market gardener—T. REVELEY, jun., Newcastle-upon-Tyne, plumber—J. BANFF, Liverpool, merchant—J. BOOTH, Kirkburton, Yorkshire, woollen cloth manufacturer—W. LUTWYCHE, Birmingham, brass founder—J. BROWN, Regent-street, Westminster, grocer—G. FLINTOFF, Plymouth, bookseller—W. VALLANCE, Liverpool, merchant.

BANKRUPTCY ANNULLED.—J. TAPSCOTT, Winshead, Somersetshire, baker.

SCOTCH SEQUESTRATIONS.—A. W. MACLEAN, Glasgow, hotel keeper—A. A. WADDELL, Glasgow, coal merchant—J. ALEXANDER, Glasgow, mason.

Metropolis and its Vicinity.

Lady Peel's Pensions.—We noticed a short time since that Lady Peel had conferred a pension of 10*l.* a-year on Mrs. Peach, the wife of a naval officer in the Coast Guard, in Cornwall, who had rendered important service to natural history by his researches on that coast, and that this pension was granted out of a sum which long usage has placed at the disposal of the lady of the Prime Minister. The list not being full, Lady Peel was desirous of completing it by the addition of a certain number of ladies who had either distinguished themselves in literature, or were the widows or orphans of literary men of eminence. Among those whom Lady Peel selected from the list recommended to her for this purpose, was Miss Frances Brown, the blind poetess of Ulster, to whom Sir R. Peel, on Christmas-eve, communicated the welcome news in the following letter:—"Whitehall, Dec. 24. Madam,—There is a fund applicable, as vacancies may occur, to the grant of annual pensions of very limited amount, which usage has placed at the disposal of the lady of the First Minister. On this fund there is a surplus of 20*l.* per annum. Lady Peel has heard of your honourable and successful exertions to mitigate, by literary acquirements, the effects of the misfortune by which you have been visited; and should the grant of this pension for your life be acceptable to you, Lady Peel will have great satisfaction in such an appropriation of it. I am, &c., ROBERT PEEL."

Repeal of the Malt Tax.—A meeting of the central committee, consisting of upwards of 200 leading agriculturists from all parts of the kingdom, was held at the York Hotel, Bridge-street, on Monday, for the purpose of adopting further measures towards obtaining the sense of the country upon this question. Mr. Fisher Hobbs, of Essex, having been called to the chair, letters were read from the local committees already at work, from which it appeared that a strong feeling pervaded the agricultural classes in favour of a total repeal of the tax, and it was consequently resolved, in order to their more effective organisation, that a form of petition should be forwarded to them for general adoption, and that a communication with the various chairmen of the market tables in the leading towns throughout the kingdom should be opened, and their co-operation requested. With reference to the necessity for increased subscriptions being obtained in aid of this movement, it was stated, that the letter from the secretary, declining, on the part of the Protection Society, to interfere, was unauthenticated by the committee of that Society, and being, therefore, of no weight, it was understood that steps would be taken at the next meeting of the various provincial Protection Societies to obtain their consent to a portion of their funds being placed at the disposal of the committee appointed to agitate for a repeal of the malt tax. The next meeting of the central committee will be held on the 20th inst., to receive further reports from the various district committees. It was stated at this meeting on Monday, that in Northamptonshire alone upwards of 150 agriculturists have consented to act as a local committee, and resolved to organise a systematic canvass of every parish in the county.

Confirmations.—The Bishop of London proposes to hold confirmations in the spring of the present year at the usual places in the county of Essex, with the exception of Saffron Walden, Thaxted, Dunmow, Bishop's Stortford, Harlow, Fyfield, and Epping. At Kensington, Isleworth, Ealing, Highgate, Hackney, Sunbury, Staines, and Little Stanmore, and at the usual places in the county of Herts, his lordship proposes to hold confirmations in the spring of 1846, and to continue to confirm, in alternate years, in the two divisions of the diocese according to this arrangement. No alteration will be made with regard to annual and triennial confirmations for the metropolis and its immediate suburbs. The Bishop of Winchester proposes to hold confirmations throughout Surrey in May and June next.

Attempt to shoot the Duke of Normandy.—The papers for some days have contained long accounts of an alleged attempt to shoot the so-called Duke of Normandy, whose name has been so frequently before the public during the last few years, and on one occasion in connection with a similar attempt said to have been made upon his life, in the garden of a house which he occupied on Camberwell Green. It appears, that the Duke of Normandy, who is a pretender to the French throne, now occupies Mulgrave House, Fulham, where he has been for [illegible] materials to be used in warfare. On Thursday, the 2d, while occupied in his private workshop after dark, he states that he heard his dog, which was fastened to the kennel outside the shop, barking furiously. He went out and released him, when he bounded down the garden, barking all the while. The Duke returned to the lathe, and had not been at it five minutes, when he heard an explosion, and saw his workshop all in flames. He thought at first that one of his officers had left some combustibles in the shop, which had ignited; but directly he saw the windows broken, he knew then that his political enemies had sent some one to shoot him. To save his life he put out the light and crouched down behind the lattice. His attendants soon arrived, and found the windows broken, and the hole made by the bullet in the partition, and subsequently the ball was found in the garden. The police have been actively engaged in investigating the affair, and it is believed that they have obtained some clue to the parties. A long inquiry took place on Monday at the Hammersmith Police-office, at which a deposition was read from M. Coupellier, of Newman-street, stating that on the 19th December he followed four gentlemen along Regent-street to the American Stores public-house, in Oxford-street, into which they went, and were joined by two others; that he went in also, and sat where he was not observed when he heard them state that three of them were going to Belgium and two to Calais, and that the one who was speaking was the only one who would remain to finish some affairs he had in hand. M. Coupellier also stated that he also heard them say that they intended to kill the Duke of Normandy, and that it would be done before the 10th January. A long statement was also made by the Count to the effect that a political party connected with the French government wanted to take his life, and a deposition was put in by M. De Lotz confirming the statement of M. Coupellier, who was prevented attending the inquiry by severe illness. A letter was also read from the Abbé Duriel, addressed to the Duke, and dated the 26th of December. It stated, "I have to inform you of a plot, which I think it necessary that you should know. I have also to congratulate you on your late reconversion." The Duke explained that this related to his reconversion to the Catholic faith. The magistrate then directed that the police officers should make inquiries without delay at the American Stores, and all other places which had been named, as to the truth of the statements, and when they were prepared with more evidence he would go further into the case.

The Metropolis Roads.—The total darkness which has so long prevailed along the great western road, particularly between Kensington and Knightsbridge, since the refusal of the Commissioners to continue the expense of lighting them, is now at an end, the inhabitants of the parish of St. Margaret, Westminster, in which parish that portion of the road is situate, having undertaken to light it. For that purpose 41 lamps were last week placed on the lamp-posts still existing along the road, and on Christmas-day were lighted for the first time. Through Kensington the road is lighted by the inhabitants as far as Hammersmith turnpike, and at a recent meeting of the inhabitants of Hammersmith, it was resolved to light their portion of the road also.

South Sea Company.—The Quarterly Court of Proprietors of South Sea Stock was held last week. The Chairman stated, that the guarantee fund was now completed, and that the amount had been invested in Government securities, but had not yet been transferred into the name of the Company. The accounts showed that the sum required from Government to make up the usual dividend was 5248*l.* 2*s.* 11*d.* The Chairman moved that a dividend of 1¾ for the half-year be paid on the Company's stock; and said that the directors had determined to adopt the most rigid economy in the management of affairs. In answer to a question whether the surplus funds were to be distributed among the proprietors, or whether affairs were to be carried on as hitherto, the chairman replied that the act of Parliament compelled them to adopt the latter course. A motion was brought forward to the effect, that a special Court should be summoned to take into consideration the general affairs of the company, and especially to consider whether the allowance of 300*l.* per annum for each 1,000,000*l.* of stock managed (the remuneration allowed by Government) should not be the only remuneration to the directors and clerks for such management. An amendment to this motion, by which it was proposed that these matters should be taken into consideration on the next Court day, was put and carried; and the Court adjourned after the dividend had been confirmed.

Victoria Park.—The operations for the formation of the new park are now in complete activity. The external boundaries of the fields and plantations required for the site have been removed and levelled; the line of park-paling has been laid out, and a considerable extent of it has already been placed up at the termination by Hackney Wick; and a road, 60 feet wide, levelled across Bonner's-field, opposite the Greyhound tavern, in Old Ford-lane, which will form the principal entrance into the park across the Regent's-canal, by a handsome suspension-bridge. Bonner's-hall is nearly level with the ground, the building materials having been disposed of a few days since. In the process of its destruction several copper coins of Queen Mary and Charles II. have been found, thus authenticating the antiquity of the building. Simultaneous with this, improvements of a very extensive nature have recently been made all over Bethnal-green parish.

Death of Professor Webster.—Mr. Thomas Webster, Professor of Geology in University College, died in

London-street, Fitzroy-square, on the 26th December, in his 72d year. Professor Webster was a native of the Orkneys, which he left at a very early age, and having taken lessons in the English language from an actor at the theatre of Edinburgh, came to London to seek his fortune as an architect and landscape artist. Among his earlier engagements, Mr. Webster travelled over great part of England and Wales, making sketches of scenery and gentlemen's seats for private patrons and for the illustrated works of that day. He afterwards settled in London as an architect, and his chief work in that profession, the theatre of the Royal Institution, has been referred to in evidence before Parliament as one of the first and most successful applications of scientific principles to the construction of a building in which seeing and hearing are the essential points. The *Historical Register* supplies us with the following facts in reference to Professor Webster's occupations after he had given this proof of his ability in architecture. "That he subsequently deserted it for philosophical pursuits was owing, perhaps, to the accident of his acquaintance with Count Rumford, whom he assisted in his researches into the principles of Domestic Economy, and it was through the Count's influence that Mr. Webster was, to use his own words, 'the first officer, in point of time, that was appointed in the Royal Institution of Great Britain, for the application of Science to the common purposes of life, to the founding of which Count Rumford had so materially contributed.' But it was not in this branch of science alone that he became distinguished. His celebrated article on the 'Fresh-water Beds,' discovered by him in the Isle of Wight, shortly after the publication of Cuvier and Brongniart's work on the 'Mineralogy of the Environs of Paris,' was the foundation of his repute as a geologist. This paper appeared in the 'Transactions of the Geological Society,' vol. ii., 1814. In the same year he was appointed Keeper of the Society's Museum, and Draftsman, and in 1826 became House-secretary and Curator. In 1816 he assisted the late Sir H. Englefield in his splendid work on the Isle of Wight, contributing all the geological part, and the greater proportion of the drawings. His appointment as Professor of Geology to University College took place about four years since, but he had long previously been known as a popular lecturer on that science. The knowledge Mr. Webster had acquired under Count Rumford was, perhaps, of more benefit, in a mere pecuniary sense, than any one of the many various subjects to which his versatile mind applied itself. It was for this he was selected by the late Mr. Longman to carry out his scheme of a complete 'Encyclopedia of Domestic Economy,' a work which, after having been commenced by the late Mr. Loudon, and passed through the hands of many scientific gentlemen, he finally completed and published shortly before his death. The difficulties he encountered in making drawings of furniture for that publication were in the highest degree amusing. Cabinet-makers regarded him with suspicion; auctioneers had him ejected from their rooms; and it was only in shops of brokers that Professor Webster could labour without interruption. Mr. Webster also edited the best edition of 'Imison's Elements of Science and Art,' adding a copious elementary treatise on perspective. From his literary labours and other sources Professor Webster (though living apparently in very straitened circumstances), had accumulated some hundred pounds, which were found in his house after his decease. He had also enjoyed a pension of 50*l.* per annum, granted to him by Government, at the representation of his geological friends, in 1840 or 1841. His relatives, if any, are unknown. He was buried on Thursday, January 2d, at the Highgate Cemetery."

Improvements at Whitehall.—It is stated that Mr. Barry, the architect, has been directed to examine the buildings now occupied by the Board of Trade, with a view to provide additional accommodation for the departments now under the control of that board, which have been greatly increased by the establishment of the railway commission. Mr. Barry has determined upon a plan which will afford the required accommodation, and improve the present appearance of the buildings, by raising the elevation, and thus afford an effectual screen to the ugly roofs and chimney-pots which are now visible above the present parapet. It is also in contemplation to pull down the old building at present occupied by the department of the Home Secretary, which has long disfigured that portion of Whitehall, and to erect a more sightly structure, in conformity with the new front of the Board of Trade.

Expulsion from the Bar.—A few months back complaints were made against certain unprofessional practices of some members of the bar, which were taken up by two or three of the inns of court. It now appears that the complaint against a barrister of the Hon. Society of Gray's-inn has been established according to the judgment of the benchers, who performed the painful duty of expulsion—from which decision the party has appealed to the judges. A charge was also made against a member of the Hon. Society of Lincoln's-inn for circulating a table of fees, and offering a commission for business. The benchers, it is said, have instituted an inquiry into the circumstances, but have not found the complaint established.

The Robberies at the Docks.—During the night of Friday last a cask, lying among a tier of packages of tobacco deposited in the large warehouse appropriated to the bonding of that article in the London Docks, was plundered of a large quantity of leaf tobacco, amounting to upwards of 150 lb. weight, with which the thieves managed to get clear off. The warehouse in which tobacco is bonded is always, in consequence of the high rate of duty to which it is liable, under the locks of the Crown, the keys being deposited in a place of security, and it is a matter of surprise how this daring robbery could be effected, and so large a quantity of loose tobacco be got over the high walls of the premises, without detection. This is the fifth or sixth occasion of a robbery having taken place at one or other of the dock establishments, in the short space of a month, without any clue being had to the parties implicated, and it is believed that there exists an extensive gang of plunderers, who have been concerned in each of them, and whose well-concerted schemes have hitherto defied all attempts to discover them.

The Surplice in St. Marylebone.—On Sunday last Dr. Spry, the rector of the parish; the Dean of Chichester, rector of All Souls district; and Dr. Penfold, rector of Trinity district, discontinued the use of the surplice in the pulpit, and resumed their black gowns when preaching. No reason was assigned for this change, which is said to have given great satisfaction to the respective congregations.

The late Fire in Guilford-street.—The remains of what were supposed to belong to another sufferer, which were found last week, consisting of a burnt foot, and several half-consumed bones, turn out to be those of the lad Robinson, whose charred trunk had been alone discovered when the jury had terminated the inquest. It has therefore been deemed unnecessary to re-open the inquiry.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Jan. 4:—West Districts, 246; Northern, 266; Central, 265; Eastern, 270; Southern, 370; Total, 1417; males, 718; females, 699. Weekly average for the last five years, 963. Births in the week, 1462; males, 737; females, 725.

Provincial.

Aylesbury.—The local papers state that Sir T. C. Sheppard has followed the example of Dr. Lee, Sir H. Verney, and the Duke of Bedford, in taking effectual measures to put an end to the injuries of game. One day lately upwards of 600 hares were shot in some fields, on Sir T. Sheppard's estate, at Thornborough, in this county; and his tenants have unlimited permission to defend their property in any manner they may think proper from the ravages of the game.

Birmingham.—Last week a service of silver plate was presented to George Barker, Esq., F.R.S., by a committee of gentlemen representing a large number of his fellow-townsmen, who, although entertaining various opinions on religious, civil, and political subjects, united in manifesting by these tokens of acknowledgment their personal attachment and esteem for Mr. Barker, as well as their gratitude to him for his unremitting exertions during a long course of years, in aid of the Charitable and Scientific Institutions of Birmingham. In addition to the service of plate, the subscribers placed a bust of Mr. Barker, executed by Mr. Hollins, in the Board-room of the General Hospital.

Bristol.—The Great Britain has made a successful experimental trip to Lundy, with about 50 of the proprietors and friends. She will soon be taken round to London, and public notice has been given that parties who wish to join in the excursion may do so on payment of 5*l.* passage-money.

Croome.—The long inquiry before the magistrates respecting the late poaching affray on the Earl of Coventry's estate, has terminated in the committal of Joseph Turvey and Samuel Dineley on the charge of Wilful Murder. After delivering the verdict, one of the jurors addressed to the coroner and his brother-jurymen some observations on the subject of the preservation of game, which had led to their present inquiry. He said that although he was aware that strictly their duties as jurors were limited to an inquiry as to how the ill-fated man had come by his death, still they could not overlook the cause which had led to such a result, and he thought that an expression of their feelings on that subject would not be out of place. He, therefore, proposed that they should append to their verdict a declaration in the following words:—"That the jury cannot but deplore the continuance of laws so immoral in their tendency, so fruitful in crime, and so destructive to human life as the game laws have proved, after long experience throughout the length and breadth of the country; and that they strongly recommend their abrogation." Several jurymen expressed their concurrence in these sentiments. The coroner said, that whatever might be his feelings on the subject, he could not attach such a declaration as the above to their verdict, for that such a step would most probably lead to a reprimand from the judge for introducing extraneous matter. If, however, the jury presented such a declaration to him, with a request that he would forward it to the Secretary of State, he should certainly comply with their wishes. The coroner's suggestion was immediately adopted, and the declaration, having been signed by the jury, was handed to that officer for transmission to the Secretary of State. One of the jurors in signing the paper, remarked that our gaols were half filled with offenders against the game laws. The taking of game, he said, was a great temptation to the lower orders, who could not be brought to believe that such an offence was a moral crime; or, in fact, that game was public property.

Dolgelly.—On Friday week, a fire broke out at Dolgyn Hall, the seat of Sir L. H. Lewis, situate near this town, and was not extinguished until the building was entirely destroyed.

Durham.—The local papers mention that, some months ago, a convict made his escape from the custody of the officers who were carrying him to Woolwich, by leaping from a railway train whilst passing through a tunnel at the rate of upwards of 30 miles an hour. His escape was not discovered until the train emerged into daylight, when the policemen started back in search, but did not succeed in recapturing their late charge, though they found his hat at the further side of the tunnel. From that time, nothing more was heard of the fugitive until last week, when it was discovered that a man called Plummer, who was convicted at the assizes in this city of burglary, was the individual. He states that the first person who relieved him was a policeman, who furnished him with a hat, and gave him some coffee; after which he travelled northward, and escaped discovery till apprehended on the charge for which he has now been transported.

East Farleigh.—Our readers are already aware of a correspondence that has been some time in progress between the Archbishop of Canterbury and Mr. G. Kennard, jun., late churchwarden of this parish, who had made strong and frequent complaints to the Lord Primate, against the Rev. Mr. Wilberforce, the incumbent. The result of the last complaint will appear by the following letter from the Archbishop:—

"Lambeth, Dec. 10.—Sir, On the receipt of your letter I wrote to Mr. Wilberforce, and received his answer some time ago, but I have been prevented by other pressing business from acquainting you earlier with the result. I directed Mr. Wilberforce's attention to the complaint respecting the singing in the church, which appears to me from his answer to be conducted without any material variation in the manner and in the principles which were approved by the Archdeacon of Maidstone; considering that matter, therefore, as settled by my former judgment, I say nothing more. In respect to the allegations 'that in the sermons preached is said of the Church and the sacraments, and so little of the merits of our Saviour and the influence of the Holy Spirit, that the sign is made of greater importance than the thing signified,' Mr. Wilberforce affirms that this charge is directly contrary to the truth. The charge of having inserted the word *blessed* before the words Virgin Mary in the Creed Mr. Wilberforce solemnly denies. He is certainly not one could not unconsciously have made so great a misstatement, and has corroborated his own memory by that of another, who is always present at church. In regard to these charges, the only ones of any importance relating to the church service surmises and matters irrelevant being necessarily put out of the question, I am satisfied with Mr. Wilberforce's answers, and I am the less surprised at any mistake that may occur in your statements, as I understand that you have not been at East Farleigh Church since the beginning of March last, and consequently cannot speak to the facts you have brought forward from your own knowledge, but must have collected them from common report, or at least from the information of others. With this, as well as the whole of your proceeding from the first, I feel that I have reason to be dissatisfied. On taking offence at the clergyman you quitted the church—you then preferred your complaints to me—I commissioned the dean of the neighbouring rural deanery to inquire into the circumstances—you excepted to his report—I made further inquiry through the Archdeacon of Maidstone, who, after personal attendance at the church, and communication with different parties, gave in a report on which my decision was formed. You then come to me, impeaching my judgment, and the Archdeacon's representation, on which it was grounded, and preferring fresh charges, which you could not for a certainty know to be true. Allowing you full credit for intentional veracity, I entreat you seriously to consider whether your feelings may not have carried you further than you will approve on reflection, and whether peace can ever be hoped for, if no individual will cease from disturbance unless everything is settled in accordance with his own views. Here our correspondence must end. I should have been glad to in bringing it sooner to a close by your having published my letters without my permission, even before you had received my final reply, at the same time making your own letters the vehicles of censure on the clergyman of your parish, who has been prevented by a sense of propriety and deference to the opinions of his Ordinary, from coming publicly forward in his own defence.—I remain, Sir, your obedient servant, W. Cantuar.
Mr. G. Kennard, Jun.

To this letter Mr. Kennard replies in a letter which exhibits a singular contrast to the style of the Archbishop. He says, "Nothing to his mind can be more unsatisfactory than the manner in which his Grace has disposed of the several charges brought against Mr. Wilberforce," that he was prepared, in case his Grace had instituted a fair investigation, to bring forward witnesses to prove that Mr. Wilberforce had inserted the word *blessed* before the name of the Virgin Mary in the Creed, that he had himself informed his Grace more than once that he had ceased to attend his parish church, and that his information was obtained from parties on whom he placed the fullest reliance.

"Mr. Wilberforce" he says, "may affirm that the charges alleged against him are directly contrary to the truth, and your Grace may believe his statements in preference to mine; but I need hardly inform your Grace that the Tractarian party are not distinguished for their strict adherence to truth where their position requires the contrary; as Mr. Newman, the leader of the sect, acknowledges it as one of their principles, that the Christian 'both thinks and speaks the truth, *except* when consideration is necessary; and *then*, as a physician for the good of his patient, he will be *false*, or *utter a falsehood* as the sophists say.' Although in the course of these my attempts to procure redress, the community at large must have made the painful discovery that ecclesiastical proceedings are not always prosecuted with the same impartiality and regard to justice as those of civil legislation, and that on this occasion there has been a desire evidently manifested to shield the clergyman from censure at the expense of the laity, yet, in again addressing your Grace, I feel I have discharged a necessary though painful duty, which I owe to myself, to the parishioners of East Farleigh, and to the public at large." P.S. On the night preceding Christmas-day Mr. Wilberforce, attended by Mr. Hards, churchwarden, and several men and boys belonging to his newly-formed choir, headed by Mr. Holmore, of Her Majesty's choir, St. George's, Windsor, paraded parts of the parish singing carols, many of them carrying lights, though the moon was high; they were out, thus occupied, from about 11 o'clock at night till nearly 4 o'clock in the morning of Christmas-day!"

Exeter.—The agitation against the Rubric continues unabated in the diocese of Exeter. Since our last notice, the bishop has addressed the following reply to the memorial and resolutions agreed to at Redruth. "Bishopstowe, Dec. 28, 1844. Sir,—I have received your letter, containing a memorial and a copy of resolutions of a meeting at Redruth, of which you were chairman. The memorial is drawn up in terms which entitle it to more respectful

consideration than many similar addresses have merited. Indeed, the only particular which calls for any adverse remark from me is the threat contained in the second resolution, which had almost determined me to decline taking any notice of the memorial. Still I am more disposed to take in good part whatever can be so taken than to find reason for censure or complaint. On the surplice, no difficulty remains. I have withdrawn that portion of my order. On the offertory, I leave it to my clergy to exercise their own discretion. Those of their congregation who duly feel the duty of almsgiving, if they are averse to use the privilege of giving to God in the way in which the Church points out, appear to me to be influenced by an erroneous prejudice—but certainly not by selfishness or worldly-mindedness. Those terms apply only to such persons who have not a due sense of the duty of Christian almsgiving, and to them I dare not be afraid to apply them. The Rubric being the law of the Church, I deem it, for reasons publicly stated by me, necessary to enforce it. I rejoice to think that very few alterations will be required in churches where reasonable attention to the Rubric has hitherto prevailed."

Haswell.—The committee appointed for collecting subscriptions for the relatives of the sufferers at the recent explosion at Haswell colliery, when 95 persons lost their lives, met on Thursday, at Haswell, to decide in what manner the subscriptions should be dispensed. The Rev. H. G. Liddell, rector of Easington, was called to the chair, when it was reported that 4186*l.* 1*s* 1*d.* had been paid to the treasurer, and that 142*l.* 18*s.* 10*d.* had been paid for the relief of the widows and children, from the time of the accident, the 28th Sept. last, to this time. Considerable discussion arose as to the best mode of disposing of the surplus, 4043*l.* 2*s.* 3*d.*, and it was finally resolved that 1800*l.* be invested for the purchase of annuities for 15 years, and 1700*l.* for the term of 7 years, and that the disposal of the residue, amounting to 543*l.* 2*s.* 3*d.*, be left to the discretion of the committee.

Haverfordwest.—On the 27th ult. a murderous attack was made by a party of poachers on the gamekeepers of Sir R. B. Phillips, M.P., of Picton Castle. The poachers had the advantage of a position on rising ground during the affray, and they succeeded in disabling eight gamekeepers, and leaving them severely injured in a ditch. One of them had his skull fractured, and three others were dangerously wounded. Some of the poachers were also much injured, but were carried off by their companions, who left behind them the stocks of two guns which had been broken by the force of the blows. One man is in custody on suspicion of being concerned in this outrage.

Jersey and Guernsey.—The assent of Her Majesty in Council to the Reform Bill passed by the States on the 7th June, 1843, was received by the Lieutenant-Governor on Thursday the 2d, and communicated to the Bailiff on the following day, whereupon the order in council conveying Her Majesty's sanction was registered by the Royal Court, and now has the force of law. The Bill which has thus been passed consists of enactments to the following effect, the only deviation from the original project being contained in the words printed in italics, in the first article, which have been added by order of Her Majesty in Council:—1. No general tax to be levied, unless voted by two-thirds of the States of Deliberation. Such tax not to exceed one penny per quarter in any one year. Any tax exceeding that amount must be sanctioned by the States of Election, *and must receive the consent of Her Majesty in Council, signified through one of Her Majesty's Principal Secretaries of State.* 2. Taxation to be uniform, and to be levied on all personal property wherever situated, and on all real property in the bailiwick. 3. The said property to be responsible for the present debt. 4. States taxes to be raised in the same manner as parochial taxes. 5. When a general tax is to be levied the constables to furnish lists of ratepayers to the treasurer of the States. 6. The town parish to be divided by its own officers into four equal cantons; each canton to have a douzaine which shall send one of its members as a deputy to the States, and the parochial douzaine to send two. 7. Each cantonal douzaine to consist of twelve members, to be elected for life by the rate-payers of the canton, and to be presided by a dean. 8. The first election of cantonial douzaines to be presided by a constable of the parish. The qualification for a douzenier to be 15 quarters. 9. The cantonal douzaines to have the superintendence of the roads without the barriers. 10. The parochial douzaine to continue to represent the parish in its unity, as at present, and to have the administration of all its affairs. 11. The States of Deliberation to be composed of the President and Jurats, 13; the Clergy, 8; Queen's Procureur, 1; Deputies of St. Peter's Port, 6; Deputies of country parishes, 9: Total 37. 12. The deputies to the States, instead of being the constables, may be such members as the douzaines may choose from among themselves, and to be elected for each meeting. 13. All the members of the States of Deliberation to have equal rights and liberties, and may propose amendments or adjournments. In cases where a question shall not be decided by two-thirds of the members present, it is to be submitted a second time by the President, *if he think proper*, within one month, and shall then be decided by a majority of votes. 14. The President to convoke the States on a requisition signed by one-third of either of the three constituent bodies, or by any 10 members. 15. The States of Election to be composed of the Court and Clergy, 22; the douzeniers and constables of St. Peter's Port, 70; and the douzeniers and constables of the country, 130: Total 222. 16. *Billets d'état* to be sent to all the members of the States.

Keswick.—The local papers state that Keswick Church, in the churchyard of which lie the remains of the late Dr. Southey, is about to undergo a general alteration and repair, at the estimated cost of upwards of 3000*l.*, which will be borne by J. Stanger, Esq., of the Dovecot, Keswick. The same gentleman some time ago built a new school for the benefit of the town, which cost upwards of 1000*l.*

Leeds.—It is said that some intention exist amongst the Roman Catholics of this town to provide an establishment for the Sisters of Mercy—an order of nuns who devote themselves to the education of the children of the poor and to the relief of the sick. Some liberal subscriptions have already been offered for this purpose.

Liverpool.—On Saturday week the two murderers, George Evans and Thomas Stew, were executed at Kirkdale, the former for the murder of his landlady at Manchester, and the latter for the murder of his sweetheart, Alice Nolan, at the same place. These executions had scarcely occurred, when Liverpool was again startled by the details of another murder committed in the vicinity of Rockferry on the Cheshire side of the river. It appears that on Thursday week at 10, P.M., Mr. Peacop, one of the partners in the firm of Golding & Co., flour-dealers and bakers at Rockferry, was waylaid and robbed by three men while on his way to his lodgings at Bebington pasture, and so severely injured that he died on Saturday last. Mr. Keyzier, of Liverpool, hearing his cries for help ran to his assistance, but was himself attacked and seriously wounded by the robbers. No clue has yet been obtained to their detection.

Manchester.—On Wednesday an aggregate meeting of the Anti-Corn Law League was held in this town. Mr. Wilson presided, and the meeting was addressed by Mr. M. Phillips, M.P., Mr. Brown, the late candidate for Lancashire, Mr. Cobden, Mr. Bright, Mr. Brotherton, and other gentlemen.

Oxford.—The observations made by Bishop Philpotts on the proceedings at Oxford against Dr. Pusey, in the letter to Mr. March Phillips, from which we gave copious extracts in our last, has led to a correspondence between the Oxford authorities and his Lordship. Dr. Hawkins, Provost of Oriel, has written a letter to the Bishop on behalf of the late Vice-Chancellor and the other heads of houses who concurred in the proceedings against Dr. Pusey, complaining that his Lordship has reflected with undue severity on their conduct. This document is interesting as containing the first official explanation of many points which excited public attention at the time. Dr. Hawkins says, in regard to not making known the grounds of their sentence, that—

"During the distressing agitation consequent upon the proceedings alluded to, the then Vice-Chancellor, and those who were associated with him, steadily refused to publish any account, either of the grounds of their censure upon the sermon, or of the form of proceeding which they had observed. Believing that it was not their duty to do so, assured that it was not their province to offer instruction to the University upon points of doctrine, much less to gratify the curiosity of the public, although they did not pretend to any indifference to public opinion, they determined to support, for a time at least, any measure of obloquy, rather than by any publication on their part increase the prevalent excitement, or inflict additional pain upon Dr. Pusey himself, or, above all, make any paper of theirs the occasion of an irreverent controversy concerning the doctrine of the Eucharist. It was of course our duty to act under the statute; we had no power to amend it; and having ascertained the sense of the statute as correctly as we could, with the aid of those recorded precedents to which we had access, we were satisfied that our business in the first instance was exclusively with the written sermon. If, indeed, the preacher could produce no copy of his discourse, the statute expressly provided that he should be called upon to answer personally concerning the matters of which he was suspected or accused; but if (as in this instance) he delivered an authentic copy of the sermon, there was no room for evidence or cross-examination, and we had only to consider the sermon itself, not discussing with the writer the doctrines which it contained, but comparing them with the formularies of the Church. This painful duty, accordingly, we endeavoured to discharge as carefully as we could. Yet, in point of fact, we had also before us, at that time, some explanation and defence of the sermon from the author; for Dr. Pusey sent a letter with the sermon, explaining his sentiments at greater length with reference to the passage which was most likely to be misconstrued; and he both prefaced his copy of the sermon, and accompanied it throughout, with parallel passages from older divines and from the fathers, intended to justify the expressions which he had employed. But the judgment upon the sermon was only the first stage of the proceedings. The Vice-Chancellor having now to consider the question as it respected the writer, could not forget that a writer's meaning might be misapprehended, or his expressions admit of qualification or correction; and even if in themselves censurable, might be no proof that the author entertained 'unsound opinions.' For the purpose of preventing such misapprehensions, there ore, he entered into communication with Dr. Pusey, in the interval between the delivery of the judgment upon the sermon (May 27), and the sentence issuing against the preacher (June 2). It is true, the Vice-Chancellor, who is as kind as he is upright, did not desire the writer to wait upon him, nor did he call upon the writer, nor did he consider it his duty to enter into controversy with the preacher concerning points of doctrine, and did not in this sense hear him; but he sent to Dr. Pusey by his most intimate friend, written papers stating the specific objections taken to his discourse, and giving him opportunity to disclaim any meaning improperly attached to his expressions, and to declare his adherence to those parts of our articles and formularies with which, under such imputed meanings, his expressions had appeared to be at variance. Dr. Pusey replied to these communications at some length, but the papers not having proved satisfactory to him, and his answers having failed to satisfy the Vice-Chancellor, the result was made known to the assessors, and the sentence issued."

The Bishop, in reply to this, sharply rebukes the Oxford authorities with not understanding his letter.

"My adverse observations were most explicitly limited to the principles of the law which you had to administer; and even of that law I said that it must not be judged of without recollecting the 'very special duties of caution and jealousy,' which belonged to 'an university as such.' You say, 'possibly your Lordship did not mean to cast any reflections on our conduct:' I answer, that until I read your letter I should have judged it impossible that any person could see in what I had said the slightest indication of such an intention. * * You will do me the justice of recollecting that I am not now for the first time distinguishing between that law and its administrators. In answer to a letter from the committee (of which I believe you were a member) for conducting the election of the present Vice-Chancellor in October last, I expressed my regret that an indispensable engagement (a confirmation fixed on the day of the election) would prevent me from making a journey to Oxford for the mere purpose of recording by my vote my sense of the injustice of the opposition to Dr. Symons, because he had in Dr. Pusey's case conscientiously performed a painful duty which was forced upon him."

Dr. Hawkins upon this apologises for the misapprehension of the bishop's meaning, and states that it is very possible that the statute might be altered with advantage. In the meanwhile Dr. Pusey thinks it necessary to take notice of Dr. Hawkins's account of the proceedings in reference to his suspension, and accordingly publishes a letter to that gentleman for the purpose of preventing the mistaken impression which, in his opinion, might arise from Dr. Hawkins's statements. In regard to the *specific objections* which the Vice-Chancellor is represented as having made to Dr. Pusey's discourse, through the medium of a private friend, Dr. Pusey says:—

"With respect to this, it is my duty to state explicitly that the communications made to me after my sermon had been condemned, were expressly declared by the Vice-Chancellor to have been made *with a view to recantation, not to explanation.* The only offers made to me were to sign, in the very words, certain complex doctrinal statements (drawn up by the Vice-Chancellor, with your assistance), which were meant as a recantation, or directly to recant. In refusing these statements in part, I explained why I did so, and indeed I endeavoured to force an *ex post facto* hearing; but my explanations, even if there had been any disposition to receive them, were necessarily inadequate, since, in part, I did not understand the meaning of the document which I was required to sign, and this meaning was never made known to me. So far from thinking it right to receive any explanation, the late Vice Chancellor expressly objected to the answers which I made in refusing to recant that 'they were, at most, *qualifications* of the language of my sermon,' and even implied that recantation itself would not meet the whole case."

Dr. Pusey substantiates this statement, by quoting a letter written to him by the Vice-Chancellor, Dr. Wynter, at the time (June 3, 1843), and appeals to it for an account of what had passed between him and the University authorities, as a vindication of his character from the charge of disingenuousness implied in the letter of Dr. Hawkins. The Vice-Chancellor's letter was in reply to one from Dr. Pusey himself, of which he says he has no copy, and of which, with his other papers and notes, Dr. Wynter subsequently thought it necessary to refuse him even the sight. The following is an extract from the Vice-Chancellor's letter, containing the portion to which Dr. Pusey refers:—

"When the decision as to the sermon was pronounced, it remained for me to select one of the two courses prescribed by the statute. To suspension I had the greatest aversion, without, at least, giving you the opportunity of showing whether you could recant. With this view, and in order to spare you from being brought before the tribunal which had given judgment upon the sermon, merely to say that you would not recant, I endeavoured, with the help of the Provost of Oriel, to frame a document, to which, if you had assented, nothing would have remained but some formal proceeding in accordance with it. But this you did not do. You proposed modifications, and you excepted against a word which was of considerable importance, as being an indication of particular opinions. You also objected to adopting words which did not occur in the formularies of the Church—an objection which I did not consider valid, because having in your sermon raised a suspicion that you held something contrary to what the Church held, it would not have been possible to allay such a suspicion by confining yourself simply to the language of the formularies. You also requested that if you were called upon to recant, you should have the very words of the sermon put before you for that purpose, as the statute (I admit) enjoins. Seeing, then, that you could not adopt the paper first proposed to you, I next endeavoured to ascertain whether you would be likely to *recant* the very words of the sermon, and for this purpose passages were selected as a specimen of what might be required under that head, but to these also you made objections, and the utmost that could be said of the statements which Dr. Jelf took down from your mouth was, that they were qualifications of the language of the sermon. These two attempts to bring about a recantation having substantially failed, and it being strongly impressed on my mind, that, besides particular objections, an exception had been taken to the general tenor of the sermon, which, of course, no recantation could touch, I at length made up my mind that no course remained but to proceed to what I felt to be a very severe measure, but, nevertheless, the only alternative, namely, suspension. This is my version of what has passed, and if it differs materially from yours, it is because, as a matter of necessity, it was intrusted to a third person, who, however friendly to both of us, and admirably qualified for a peacemaker, could not exactly put himself in the place of either."

Plymouth.—It is the intention of the Board of Ordnance to order the harbour at this port to be fortified. Two strong batteries, with 56-pounders, capable of firing red-hot shot, will be erected at Staddon Heights, another at the Obelisk, and one or two others at other points at Mount Edgcumbe. Heavy guns will also be placed in the Citadel, at Clarence Point, Stonehouse Hill, and Mount Wise. The necessary estimates have been made, and the fortifications will, it is understood, cost upwards of 18,000*l.*

Romford.—On Saturday, at the Court of Bankruptcy, Mr. Mann applied for his certificate, and no opposition having been offered, it was immediately granted. It was stated that the joint estate would probably pay about 2*s.* 6*d.* in the pound. Mr. Mann's private creditors will receive 20*s.* in the pound on the 22d instant, and the surplus of his private estate (about 12,000*l.*) will be handed over to the general fund of the joint estate.

Ross.—An inquest was held on Friday, at the Union workhouse in this town, on the body of an old woman, named Mary Jones, 82 years of age, whose death, it was alleged, had been occasioned by ill usage and exposure to cold, through being improperly removed as a pauper to that Union. The evidence taken was exceedingly voluminous, but the facts may be briefly told. Deceased was in the receipt of out-door relief from the union, and on the 2d ult. she walked from the parish of Llangarren,

where she resided, to Ross, in order to apply to the Board of Guardians for an increased allowance, which was granted her. On her return home, being exceedingly infirm, she became so lame and exhausted on the road as to be unable to proceed, and one of the board coming up, and finding her in that helpless condition, she was removed home in a cart. She then became so ill as to keep her bed, and a day or two afterwards, her state being made known to the guardians, one of them persuaded her to go into the workhouse, where she would be properly attended to; she refused, saying she had a great objection to the workhouse. Her condition becoming much worse, the parish surgeon attended her, and by his treatment she somewhat recovered. On the 14th, however, Mr. Garness, one of the guardians, accompanied by his son and Thomas Lewis and Edward Tourney, forcibly removed her to the workhouse, without the usual medical certificate. Deceased having an extreme dread of the Union-house, and fearing that she would be forced to enter it, locked all the doors in the cottage, so as to prevent them removing her. They, however, broke in, and one laying hold of her head and the other of her legs, they carried her out and placed her in a cart on some straw with a blanket round her, she at the same time violently exclaiming that "she would not go." The workhouse was reached about 4 o'clock, when the master admitted her, not in obedience to the order of the guardian who came with her, as it was informal, but owing to the critical condition of the poor creature, who was suffering severely from the cold, the frost being very intense during the day. A few days afterwards she was attacked with illness, which terminated fatally. Mr. Jones, one of the medical officers of the Union, gave his opinion that deceased's death was the result of a diseased heart, which might have been hastened by the sudden exposure to cold. The jury, after deliberate consideration, returned a verdict of Manslaughter against Samuel Garness, the guardian; Thomas Garness (his son); Thomas Lewis, and Edward Tourney, who were forthwith committed to gaol for trial. The case has produced the greatest sensation throughout the whole county.

Shrewsbury.—On Monday last, the Salopian coach from Shrewsbury met with a singular accident on its road between Shiffnall and Wolverhampton. The coach was proceeding at its usual pace, when the guard, who was seated on the top of the luggage, speaking to the driver, heard a sudden crash, and on turning his head round, he beheld, about 30 yards distant, the hind seat of the coach in the middle of the road, with four of the passengers on the ground. One passenger was taken up insensible, and the others were more or less bruised. Such an accident was never before known on the Holyhead-road.

Slough.—On Saturday, Mr. John Tawell, the quaker, of Berkhampstead, was brought before the coroner, at the adjourned inquest on the body of Sarah Hart, whose mysterious death was noticed in our last. It was proved by medical witnesses that death was caused by cyanuret of potassium, which contains a considerable quantity of the elements of prussic acid in its composition. After examining three or four witnesses the coroner adjourned the inquest to Wednesday, when the surgeons reported that they had analysed the porter and other liquids found on deceased's table, but had not detected any poison. The Jury after a long charge from the Coroner returned a verdict of Wilful Murder against the prisoner, who was removed to Aylesbury gaol to take his trial. From all that has transpired there is no doubt that the prisoner is the father of both the children of the deceased woman, whose statement that she was his son's wife proves to be untrue. Some years ago the prisoner, who is a native of Norwich or its neighbourhood, was tried and found guilty of forgery, and sentenced to be transported for 21 years. The forgery was committed upon a relative of Mr. Smith, one of the partners in the Uxbridge Bank, to the amount of 1000*l.* His good conduct while in the colony obtained for him a ticket of leave after having served seven years of his time. He then set up in business at Sydney as a chemist and druggist, and embarked generally in the shipping trade, in which he was so exceedingly successful that in the course of a few years he had saved upwards of 20,000*l.*, and returned to England, when he repaid all the parties who had suffered by his fraud. As soon as the crime of forgery had been established against him, he was discarded by the Society of Friends, and no longer acknowledged to be a member of that body. Upon his return to England from Botany Bay, between six and seven years ago, he applied to the Society to be again admitted, but was peremptorily refused, his former crime being an insuperable barrier, notwithstanding the great effort he made to be again received into membership. He then went to live at Croydon, where he resided but a short time, but where he is well known. Thence he went to Berkhampstead, where about four years ago he married, but against the wishes of her family and connections, a respectable widow, a quakeress, named Cutforth. This lady kept a ladies' school at the time, but her extensive establishment was given up immediately after her marriage with Mr. Tawell, who lived with his wife and family in a spacious house, nearly opposite the church at Berkhampstead, in very good style. He had two sons and a daughter by his first wife, whom he married in Sydney, but both the sons have died within the last five years. The deceased woman was a servant in his family during the lifetime of his first wife, and left his establishment *enceinte*, and was never subsequently in service, but was supported by the prisoner. Mr. Tawell is well known in the city, and is engaged to some extent in the shipping trade and exportation of goods. He is a subscriber to the Hall of Commerce, the Jerusalem Coffee-house, and other public mercantile establishments, and also to the Zoological Society.

Stafford.—On Friday night a respite was received by the governor of the County Gaol, from Sir J. Graham, for the youthful convicts, Downing and Powys, who were to have been executed on Saturday morning. The cause of this is said to be some point of law connected with the trial of the convicts, which is reserved for the consideration of the Judges. The execution is consequently postponed until Saturday, the 25th inst., before which time the decision of the Judges will have been given. The point reserved is, whether Mr. Justice Coltman ought not, at the request of the prisoner's counsel, to have asked the jury on which counts of the indictment they found each of the prisoners guilty; one of the counts charging Downing as the principal, and Powys as aiding and abetting; the other count charging Powys as the principal, and Downing as aiding and abetting. The Judge was of opinion that the indictment was sustained; and it is generally anticipated that the Judges will confirm Mr. Justice Coltman's opinion. Should they do so, it is understood that the prisoners will be executed, pursuant to their sentence. — On Sunday night a robbery of a serious extent was committed at the shop of Mr. Lindley, bookseller and sub-distributor of stamps, at Stoke, in this county. The premises were broken open in such a manner as none but experienced burglars could have practised, and nearly 700*l.* in money and 115*l.* worth of plate and jewellery were stolen. No clue has yet been discovered to the perpetrators of this robbery. The cash-box was found the same morning—empty, near some trees which skirt the carriage-road from Stoke to Fenton Manor House, the residence of P. B. Broade, Esq.

Ulverstone.—On Friday week, the 20th ult., a man named Donahoo, an itinerant razor-grinder, who is an inhabitant of this town, murdered his wife in the most brutal manner, by striking her on the head with an iron bar, and afterwards beating her on the body. Both husband and wife were intoxicated, and were constantly quarrelling. The jury at the inquest, which occupied three days, returned a verdict of Wilful Murder.

Uxbridge.—The village of Ruislip, in this neighbourhood, has been excited by the supposed discovery of the murderer of John Brill, a young man, who was found murdered in a wood, near Ruislip, in Feb., 1837, under circumstances that were never cleared up. The person now accused is a man named Lamb, a prisoner in Coldbath Fields Prison, where he was committed for poaching. His accuser is another poacher, named Sibley, who says that Lamb told him he had murdered Brill in the wood. A communication to that effect was made by Mr. Chesterton, the governor of the prison, to the Uxbridge magistrates, and Sir W. Wiseman and Mr. Dagnell went to the Coldbath Fields House of Correction to take the deposition of Sibley, who adhered to his statement, though he evidently expected to gain some advantage by giving evidence. Application was then made to Sir J. Graham to have Lamb removed to Uxbridge, to facilitate the further investigation of the case, but the request has been refused. On Saturday last the Uxbridge magistrates examined several persons acquainted with the circumstances respecting the discovery of the body, for the purpose of guiding further inquiry into the matter.

Warwick.—On Saturday a special meeting of the Warwickshire Association for the Protection of Agriculture was held, to consider the propriety of petitioning Parliament for the repeal of the malt-tax. There were present Lord Brooke, Sir J. Mordaunt, M.P.; Mr. Newdegate, M.P.; Mr. H. C. Wise, Mr. Greaves, and other gentlemen. Mr. Ball, a tenant farmer, was called to the chair. Mr. Newdegate, M.P., addressed the meeting, and said he wished to read a letter containing the opinion of the committee of the London Protection Society, with reference to the repeal of the malt-tax, in answer to a question on that subject, since he was of opinion that it contained sound views with respect to the Protection Societies generally taking up the question. The committee in their letter deemed it inexpedient to commence an agitation for the repeal of the malt-tax, as it involved an aggressive policy, not contemplated at the formation of the Protection Society, and as there appeared to be a difference of opinion with respect to the alternative which must be resorted to, in order to supply the deficiency in the exchequer which would be occasioned by the withdrawal of so large a source of national income. Sir J. Mordaunt, M.P., said he coincided entirely with Mr. Newdegate, and, on the other hand, Mr. Hodson, Mr. Umbers and other gentlemen, supported a repeal of the tax. A letter from Mr. Dugdale, M.P., for the northern division of the county, was then read, and from which the following is an extract:—"It would give me great pleasure if the malt-tax could be repealed; but it forms so large a portion of the revenue that I believe it would be impossible for the Government to accede to such a proposal." A letter was also read from Col. Miller, in which that gentleman said—"I beg to express through you my regret that it should have been thought expedient to assemble the committee to endeavour to obtain a repeal of the malt-tax. It has always appeared to me that the advantage the agriculturists would gain by that measure has been much overrated; that with the exception of the barley-growers, the manufacturers would be as much benefited as the agriculturists; that under the present corn-laws the foreigner would be at least an equal gainer with the home grower, and therefore it would be very unwise for the agriculturists, as a separate body, to petition for a repeal of so large an amount of taxation." Notwithstanding these opposing opinions the following resolutions were ultimately carried:—"That it is the opinion of this meeting that the malt-tax is detrimental to the moral and physical comfort and happiness of the industrious classes, and oppressive to the agricultural interest generally. That the total repeal of the malt-tax would enable farmers to use the inferior barley for feeding purposes in lieu of foreign oil-cake and linseed, and thereby facilitating the means of feeding cattle for the consumption of the increasing population of this country. That in order to carry out the foregoing resolutions, this meeting firmly, but respectfully, calls upon the county members generally to support and advocate the total repeal of the malt-tax, as being beneficial to all classes of society."

Worcester.—Sir Thomas Wilde, M.P. for this city, has contributed the sum of 200*l.* to the fund now raising by a committee for the relief of the poor. Sir T. Wilde in his letter accompanying this donation, expresses his satisfaction in being able to avail himself of the assistance of the committee, as he might have exposed himself to the imputation of political motives if he had dispensed his contribution by means of private friends.

Yarmouth.—In November last a barbarous murder was committed at Yarmouth on a respectable woman named Mrs. Candler. Since then many parties have been apprehended on suspicion of being the perpetrators, and almost daily examinations have been held before the magistrates, and ultimately sufficient evidence appeared to be obtained against four men named Yarham, Mapes, Hall, and Royal, all men of doubtful character, belonging to the town. On Friday last their final examinations were held before a full bench of magistrates; and after hearing evidence at great length, the prisoners Royal, Hall, and Mapes, were committed for the murder, and Yarham as an accessory after the fact.

Railways.

The following are the returns for the past week:—Birmingham and Gloucester, 2498*l.*; Bristol and Gloucester, 1124*l.*; Eastern Counties, 430[illegible]; Edinburgh and Glasgow, 2135*l.*; Great Western, 14,738*l.*; Grand Junction, 8125*l.*; Glasgow, Paisley, and Ayr, 1355*l.*; Great North of England, 3542*l.*; London and Birmingham, 15,796*l.*; South Western, 5464*l.*; Blackwall, 613*l.*; Greenwich, 94[illegible]; Brighton, 3135*l.*; Croydon, 403*l.*; Liverpool and Manchester, 4650*l.*; Manchester, Leeds, and Hull, 5712*l.*; Midland, 9160*l.*; Manchester and Birmingham, 3268*l.*; Newcastle and Carlisle, 133[illegible]; Newcastle and Darlington, 955*l.*; Preston and Wyre, 300*l.*; South-Eastern and Dover, 4048*l.*; Sheffield and Manchester, 656*l.*; York and North Midland, with Leeds and Selby, 1956*l.*; Yarmouth and Norwich, 24[illegible]—The committee of the Directors of the Midland Railway met at Nottingham last week, and voted the sum of 300*l.* to Mrs. Dean, with 5*s.* a-week for life to the deceased's husband's mother; and likewise the sum of 300*l.* to Mrs. Bolestridge, as compensation for the loss and injuries inflicted by the late accident on their line.—The fall of the tunnel at Corbridge, on the Newcastle and Carlisle Railway, has not caused so long a suspension of business as was expected. The tunnel has been partly opened, so that waggons drawn by horses are now able to pass through it. The enlarging of the tunnel is a work of considerable skill, a drift above it being driven, by which the wider arch is made before the old one is removed. In shifting some of the machinery, a hole was unluckily made through the present roof before the new one was finished, which let down some of the superincumbent earth, and stopped the passage.—On Wednesday a special meeting of the London and Blackwall Company was held for the purpose of authorising the Directors to apply to Parliament for power to extend their line through Stratford, Leytonstone, Wanstead, Woodford, Chigwell, Loughton, and Abridge to Epping. A lengthened report was read to the meeting, detailing the probable amount of traffic between the metropolis and the towns near or through which it was intended the line should pass, and setting forth the advantages likely to result from its connecting the Blackwall with the Eastern Counties and Northern and Eastern lines. The line would be 15 miles in length, and, after crossing the Regent's-canal, would pass through a generally open country, interfering with no ornamental or costly property; the only expensive portions being those approaching the termini. From the detailed estimates which had been prepared, the Directors were satisfied the cost of the whole work would not exceed 500,000*l.*, upon which amount the estimated revenue would pay more than eleven and a half per cent. per annum. Mr. Levy strongly objected to the line, and declared the traffic returns to be greatly exaggerated. Dr. Bowring, M.P., Mr. Mangles, M.P., and Mr. Tite, however, spoke favourably of the project, and resolutions empowering the Directors to take the necessary steps to obtain an Act of Parliament to construct the line were unanimously adopted, and hopes were expressed that the Eastern and Northern and Eastern Companies would see the advantages of the branch, and give their support, as it would lead, if they did so, to their obtaining a terminus in the centre of the city.—On Thursday, a special meeting of the Eastern Counties Company was held, for the purpose of considering various extension lines affecting the interests of the company. The report was very voluminous, and the following is a brief abstract. The gauge of both the company's lines was now changed for the accommodation of the northern lines. The whole of the extension lines between Newport, Cambridge, Ely, and Brandon, would be delivered to the company on the 1st July next; the Norwich and Brandon would

be finished at the same time: this important advantage had been secured by an additional outlay of 25,000*l.* The line between March and Lincoln would be promoted by this company in case of ill success on the part of the Midland Company. The Extension Stock, No. 2, would be called in and applied to any capital not exceeding 960,000*l.*, required by the company for such of their undertakings as shall be sanctioned by Parliament. The lines that would be promoted by the company were that from Hertford, through Hitchin, to Biggleswade, a distance of 25 miles, at a cost of 350,000*l.*; from Cambridge to Huntingdon, and between the Shoreditch station and Finsbury-square, the cost of the former being 150,000*l.*; of the latter, 200,000*l.*; from Cambridge to Bury St. Edmunds, a length of 27 miles, at a cost of 330,000*l.* The line between Bury and Colchester would be applied for by this company, in case of not treating successively with the Eastern Union Company. The branch from Tottenham to Farringdon-street would be facilitated, and the line from Blackwall to Epping would be opposed by the Eastern Counties Company. In conclusion, the directors recommended a creation of 33,000*l.* of extension shares to complete their contract with the Eastern Counties and Thames Junction Company. The report having been read, the meeting was addressed by several proprietors, when it was received unanimously, and the various resolutions founded upon it were passed with marks of approbation.—On Wednesday a special general meeting of the Manchester and Leeds Company was held at Manchester, for the purpose of taking into consideration the propriety of authorising the directors to apply to Parliament in the next session for power to make a branch from the main line of the Manchester and Leeds Railway to Burnley. 2. To extend the Oldham branch from the present terminus to Mumps, in the same parish. 3. To extend the Heywood branch from the present terminus to Bury. 4. To make a branch from the intended Ashton, Stalybridge, and Liverpool Junction, at Ashton, to the Sheffield, Ashton-under-Lyne, and Manchester Railway, at or near Guide-bar, in the same town. 5. To alter and amend the existing acts of Parliament relating to the Manchester and Leeds Railway, and the act of Parliament relating to the Ashton, Stalybridge, and Liverpool Junction; including power to increase the number of directors, and for power to increase the capital of the company, and to raise money for effecting the purposes of the existing and contemplated acts of Parliament and other business. The chair was taken by H. Houldsworth, Esq., chairman of the directors, who in a very lengthy speech explained the objects of the meeting, and the reasons which had led to the directors proposing the schemes they had done. A body of resolutions, containing the whole of the above plans, and guaranteeing the amount of capital required by the directors, were then moved and carried unanimously.—On Thursday, a special general meeting of the London and Brighton Company was held at the London terminus, for the purpose of empowering the directors to apply to Parliament in the ensuing session for leave to make a railway from Croydon to Wandsworth, and two other branch lines. The first branch will commence near the Three Bridges station, and proceed through Crawley to Horsham; its length will be nearly eight miles and a half, and the estimated expense 94,035*l.* The second branch will commence near Redstone-hill, and run through Reigate and Bletchingley to Dorking, extending over a space of seven miles and a quarter. For this branch two alternative lines are proposed; one avoiding the town of Reigate altogether, the estimated cost of which is 102,364*l.*, and the other going through the centre of it, which it is estimated will cost 109,734*l.* It is left for the inhabitants of that town to determine which of the two lines is best adapted for their interest. The third branch will commence near the station at Croydon, run through Streatham and Tooting, and then join the South Western Railway in the parish of Wandsworth. It will be 6½ miles long, and will cost probably 119,191*l.* The Chairman stated that the two first lines were intended to protect the Brighton Company from the aggression of other competing parties, and the latter to accommodate the west end of London. The directors would not have recommended the proposed branch from Croydon to Wandsworth had it been intended that the terminus of the South Western should continue to be at Nine Elms. That company, however, had determined to extend its line to the vicinity of Waterloo and Hungerford Bridges, and the directors had therefore entered into an agreement with the South Western Company, upon their obtaining an act to effect this extension, to make the line to Wandsworth. Resolutions authorising the directors to take the necessary steps to obtain a bill to make the proposed line, and empowering them for that purpose to raise 339,583*l.* by creating new shares, in sixths, at 8*l.* 6*s.* 8*d.* were, after considerable discussion, adopted by the majority of the proprietors.—On Monday a special meeting of the Durham and Sunderland Company was held, "for the purpose of taking into consideration the propriety of modifying and altering the terms on which the new shares in the undertaking shall be created and issued, and for authorising the directors to adopt such measures with reference to the same shares, as the meeting may decide to be expedient and proper." There was a very large assemblage of the proprietary. It is intended to apply to Parliament, in the ensuing session, for powers to extend the line from Durham to Bishop-Auckland, to purchase the fee-simple of the land over which the railroad passes (for which the company now pays way-leave), to take the line into the city of Durham, to form a junction with the Newcastle and Darlington Railway, at Sherburn, and to effect other improvements. For the purpose of carrying out these designs an additional capital of 182,000*l.* is considered to be necessary, and at a meeting of the company, held in November last, it was resolved to raise the amount by creating new shares at 30*l.* each. The directors found some difficulty in selling the shares at this price, as the market value of the 50*l.* shares is now only 27*l.* or 28*l.* They, therefore, convened the present meeting for the purpose of considering the resolution passed in November. After some discussion it was resolved unanimously to issue new shares at 40*l.*, guaranteeing to the holders of them 5 per cent.—Four of the largest locomotives ever constructed are to be built for the Sheffield and Manchester Railway. The cylinders are to be 18 inches, the stroke 2 feet diameter, and all six coupled. The weight of the engines alone, when loaded with fuel and water, is 24 tons. It is calculated that on a level they will draw separately from 1000 to 2000 tons.

Ireland.

Dublin.—The Commissioners of the Charitable Bequests Bill held their first meeting on Monday, but the agitation against the Bill prevails with increasing bitterness, and it has even been made the subject of sermons from the pulpit. On Sunday it was rumoured, in connection with this question, that a conspiracy against the life of Archbishop Murray had been discovered in Tipperary, but it is now known to be unfounded. It is said that a special meeting of the Roman Catholic prelates is to be held in this city on the 22d inst. One of the objects of the meeting, it is said, is to consider the present state of the public mind, not only in reference to the Charitable Bequests Act, but also in regard to the statements put forward in the newspapers respecting a concordat with Rome, and the payment of the Roman Catholic clergy by the State.—The weekly meeting of the Repeal Association was held on Monday, Mr. Mullen in the chair. Not one member of Mr. O'Connell's family was present. A letter was read from Mr. O'Connell, in which he says, "I have been so employed whilst within doors on the Charitable Bequests Bill, and its pernicious accompaniments, that I am totally unable to send the address to the Irish people. You shall, I trust, have it for the next day of meeting. In the meantime I inclose you 51*l.* for my family subscription to the Repeal rent for 1845." (Here follows a list of the subscriptions, consisting of 5*l.* each from Mr. O'Connell and his three sons, and 1*l.* each from sixteen other members of his family bearing his name, and 1*l.* each from eight Fitzsimons and seven Frenchs). Mr. O'Connell also requested that notice might be given "for Monday week of a motion to make such arrangements during the next session of Parliament as may preclude the necessity of the Repeal members attending in London. I have a strong impression that the Repeal cause—the only thing in which the Irish people have a real interest—can be best managed and promoted in Ireland." The Secretary read a letter from Mr. Steel, dated Fenagh, county Leitrim, announcing the success of his mission, and stating that tranquillity had been completely restored in the disturbed districts. Mr. M'Nevin brought forward a number of reports, amongst them one on the army estimates, and proceeded to address the meeting at some length. Mr. W. S. O'Brien then declared his belief that he could be more usefully employed during the coming session in Conciliation-hall than in St. Stephen's, having already on former occasions declared it to be his deliberate conviction that the Imperial Parliament was incapable of legislating for Ireland. He denied the allegations put forward by the English press that the Repeal cause was declining, confidently asserting that there was not an individual in the country who was a Repealer in 1843 that was not now more ardently so than ever. He admitted that they could not expect to advance their cause by acting upon the mind of England—they might as well think of persuading the wolf to relinquish its prey. They must rely upon themselves and their own exertions. It had been stated that Mr. O'Connell had lost his influence—that he was no longer able to direct the power he had raised up—but he could inform the people of England that he was still the acknowledged and recognised leader of his countrymen, and he was confident that nothing could ever occur to interrupt the harmony which existed between them. An endeavour had been made to create disunion amongst the people of Ireland, and certainly if the British minister meditated such to be the result of his Bequests Act, he could not have gone a better way about creating such a result. But he told that Minister he would be disappointed. The prelates who had accepted office under that act had declared the measure as being deficient in many respects, and he was sure that unless these defects were remedied, they would refuse to assist in carrying out a Bill which was so obnoxious to the country at large. The decline of the Repeal rent had also furnished their friends on the other side with a subject of gratulation, but he trusted that the people of Ireland would contradict that assertion, by systemising that taxation—a self-imposed taxation, which should continue till the Union was repealed. The people should supply them with the means, he was going to say, of carrying on the government of the country, but he would not expose himself to an indictment of 36 yards length, and he would say, all the operations incidental to the carrying on of the agitation. Mr. O'Hea moved that the committee of the Association should be directed to prepare a general view of the proceedings of the Association for the past year, and commented at some length on the various political phases through which the people of Ireland had passed during the last 45 years, and detailed the several constitutional triumphs they had achieved. After the despatch of some routine business, Mr. Smith O'Brien announced the rent for the week to be 243*l.* 15*s.* 1*d.*—The Earl of Devon arrives in Dublin on the 15th. There are 30 clerks employed at the Castle in preparing for the Land Commission Report. The registrar of the Court of Chancery has issued circulars to the solicitors practising therein, and concerned in the management or receiverships of properties under the court, to make a return thereof, and of the locality, extent, and amount, for the information of the Commissioners.—The embankment of the pond in the Furry Hill, Phœnix Park, gave way on Saturday, and the water rushed violently into some of the adjoining houses and drowned four children, besides doing other damage.

The Provinces.—The local papers notice several meetings of magistrates in the disturbed districts, and publish the strong resolutions which they have adopted for the purpose of checking the progress of agrarian crime. Notwithstanding this, the accounts received daily contain the particulars of numerous outrages, which it would occupy considerable space to notice in detail. On Saturday, almost in open day, Patrick Ranelagh, under-agent and caretaker on the estate of Lord Massey, in the eastern part of the county of Limerick, was murdered with a pitchfork within a few yards of his own house, and in a very populous neighbourhood. No clue has been obtained to the murderers, but they are supposed to be members of his own family, who determined to be revenged on him for the occupation of land.—The Tipperary papers mention another outrage perpetrated on Thursday night, in the parish of Ballymackey. The house of an industrious man of the name of Kennedy was fired into, and three balls were lodged in the wall beside the bed in which Kennedy and his wife were sleeping.—A few days since, in the noon-day, as Michael Digan, Esq., was returning home from his customary ride, he was stopped on the public road, between Killaloe and Derry, and within five minutes' walk of the village of Ballina, Tipperary, by two ruffians, who seized his horse by the bridle. One of them presented a pistol at his breast, and swore violently that if Mr. Digan did not immediately surrender certain lands, which are in his possession for a number of years, they would visit him again, and have his life. The ruffian with the pistol, to show their determination, discharged its contents close by the horse's head, and then desired Mr. Digan to go on; after which they marched off, directing their course up the mountains.—An attempt has also been made to assassinate Mr. James Geffroy. He was on his return from his country residence at Bracklen to his house at Edgeworthstown, and when within a short distance of the latter place a person named Kerrigan came up to him, and presented and snapped a pistol at him, which providentially only burned priming. Kerrigan then ran away, but the Edgeworthstown police went in search of Kerrigan, and succeeded in arresting and conveying him to Longford gaol, to take his trial at the next assizes. It appears that Mr. Geffroy ejected Kerrigan's father some time ago from some land.—Another instance is mentioned this week of the gallant conduct of the women in resisting these attacks. An armed party made an entrance at night into the house of a labouring man named Flaherty, near Nenagh, for the purpose of stealing a gun. The owner's daughter, Mary Flaherty, declared that they should not have it, and after a violent resistance, in which she received several blows, some of them of such a desperate character as to endanger her life, the robbers were driven off, unable to accomplish their design. The young woman was brought into Nenagh on Wednesday, where she lies in a precarious condition.—On the night of the 27th Dec., about 8 o'clock, William Stapleton, of Lorha, heard some person pulling the thatch off his house, when he ordered his son John to light a candle and proceed to the yard. Stapleton followed his son immediately, and discovered his brother-in-law, Michael Phelan, outside, armed with a pistol, the contents of which he lodged in the body of the son, who fell to the ground dead. Land is the cause of this outrage, and Michael Phelan has been fully committed for trial.—A process server who had succeeded in serving 17 processes on the Derry Castle tenantry on Thursday last, was at night surprised at seeing three men, armed with blunderbusses, enter his residence at Duhallow, who demanded the originals of the 17 processes, and having obtained them, walked off. They also took away a bundle of processes belonging to other parties.—On Monday week, at Cork, the mob committed an outrage at a funeral, similar to that which occurred recently at Limerick. The gatekeeper of the Bishop of Cork was buried on that day, and the rioters attempted to upset the coffin, but without success, a strong body of police being in attendance. They succeeded, however, by incessant yelling during the performance of the burial service, in rendering the whole ceremony a dumb show.

Theatricals.

COVENT-GARDEN.—The "Antigone" of Sophocles, which was produced a short time since at Berlin with great success, was brought before the English public last week at this theatre, with Mendelssohn's music. It would be difficult by mere description to give a distinct idea of a performance so different from anything that has been seen on our stage. The "Antigone" of Sophocles is the conclusion to the tragic history of the

family of Œdipus. His two sons, Eteocles and Polynices, after their father's death, contended for the possession of the Theban sceptre, and fell by each other's hand. Creon, their uncle, ascended the throne, and, enraged against Polynices, forbade, on pain of death, that any one should bestow the rites of sepulture on his body. In these circumstances the tragedy opens. The stage is arranged as described by the ancient writers. The whole action of the piece takes place on one spot, the open space before the palace. Immediately in front of the building there is a raised platform, communicating with the interior of the palace by several doors, through which the persons of the drama make their exits and entrances; while the part of the stage next the audience is occupied by the chorus, consisting of the nobles and people of Thebes, in whose presence every incident takes place, who are always sympathising spectators, and frequently take a part in the action of the scene. When the curtain rises, Antigone appears with her sister Ismene, whom she informs of her determination, in spite of the King's decree, to inter the body of her brother. Ismene attempts in vain to dissuade her, and they retire. The nobles and counsellors forming the chorus, enter, singing a triumphal ode in celebration of Creon's accession. It is a vigorous and poetical description of the horrors of the strife between the brothers, ending with a strain of joy for the cessation of blood and discord. In the music the originality of Mendelssohn's genius is at once apparent. The whole voices sing together, for the most part in a simple melody; sometimes the voices divide themselves into parts, and sometimes chant in a kind of recitative. There is no iteration of words or phrases; but the whole poem is uttered, in this musical declamation, as plainly and rapidly as could be done in ordinary recitation. In this manner the choruses are generally treated throughout the piece; and they are accompanied by the instrumental orchestra, in the most rich and beautiful harmony that can be imagined. In the next scene, a sentinel presents himself, in agitation and terror, before Creon, and informs him that the body had been buried by some one who had eluded the vigilance of the guards. Creon threatens the soldier with death, unless he can discover the criminal. The chorus sing an ode in praise of patriotism and obedience to the laws. The soldier discovers that the transgressor of Creon's decree is Antigone, and reveals the discovery to the King, who commands Antigone to be brought before him, and condemns her to death. The musical scene which follows is equally novel and beautiful. Creon has retired, leaving Antigone alone, or rather in the presence of the sympathising chorus. She gives vent to her feelings of grief and despair in a strain of very fine poetry. This is not delivered by the actress with the musical inflexions of recitative, but is simply declaimed, while at the same time it is accompanied by the orchestra in the same manner as recitative, every break in the language being filled by a chord, or a brief instrumental phrase full of energy and expression. Antigone is consigned to a living tomb, in spite of the remonstrances and prayers of her lover Hæmon, the King's son. Tiresyas, the blind soothsayer, then enters, and denounces with indignation the cruel and unnatural conduct of Creon. Dismayed at these denunciations, the King determines to bury the body of Polynices, and to release Antigone. While he hastens to execute his purpose, the chorus burst into a song of joy, which they accompany by a dance or stately movement round the arena. The effect of this scene is indescribably beautiful. The music is gay and joyous, with an exquisite air of antique and classical simplicity. Creon, however, is too late. Before he can reach Antigone's prison, she has strangled herself in despair, and Hæmon has stabbed himself on her dead body. The Queen, his mother, distracted for the death of her son, destroys herself also; and the tragedy ends with the remorse and self-reproaches of the King, and with a grave and solemn chorus, conveying the moral of the tragic tale. The adaptation of this tragedy to the English stage is executed with great ability. The language is pure, classical, and vigorous; and in the lyrical odes there is very beautiful poetry. The character of Antigone was performed by Miss Vandenhoff, who exhibited tragic powers of a high order, and Mr. Vandenhoff gave great effect to the character of Creon. The other parts were respectably supported. The imperfection of the performance lay chiefly in the execution of the music. The chorus was sufficiently numerous, but wanted firmness and precision. The voices were often unsteady and uncertain—sometimes absolutely at fault. The reception of the piece was highly favourable. Mr. and Miss Vandenhoff were repeatedly and loudly applauded, and many parts of the music produced a strong impression on the audience.

Law.

CENTRAL CRIMINAL COURT.—*Post Office Robbery.*—*Robert Hobson*, 53, a person of respectable appearance, who has been for 20 years a grocer at Walthamstow, was indicted for having, while in the employ of the General Post-office, embezzled the sum of 1*s.* 10*d.*, the moneys of Her Majesty's Postmaster-General. The Solicitor General, Mr. Shepherd, and Mr. Adolphus, conducted the prosecution; and Mr. Wilkins appeared for the prisoner. From the evidence of the witnesses, it appeared that the prisoner had the management of a branch post-office at Walthamstow, in Essex, and on the 14th December a woman, named Carter, took a letter addressed to her husband, a seaman, whom she at that time believed to be at Calcutta, to which place the letter was addressed, to the prisoner, and paid him one shilling postage. Shortly afterwards the prisoner sent to her to say that the postage was 1*s.* 10*d.*, and she gave the additional charge required. The letter never came to hand at the General Post-office; and, in consequence of some suspicion, Mr. Sculthorpe, one of the gentlemen who hold the office of president in that establishment, went down to Walthamstow, accompanied by Peake, an officer in the employ of the Post-office, and questioned the prisoner, when he gave several contradictory statements. While, however, the prisoner was conversing with Mr. Sculthorpe, the officer, who had in the meantime been searching the house, found the identical letter in one of the prisoner's private drawers. Several highly respectable witnesses were called, who gave the prisoner an excellent character. The jury returned a verdict of Guilty, coupled with a strong recommendation to mercy. Mr. Justice Patteson, after a brief consultation with Mr. Justice Erle, addressed the prisoner, and said that for the offence of which he had been convicted, the law provided a punishment of 14 years' transportation, or any period of imprisonment not exceeding three years. The Court, however, in the present case, had great satisfaction in giving effect to the strong recommendation of the jury. The sentence upon the prisoner was, that he should be imprisoned, without hard labour, in the gaol of the county of Essex for twelve calendar months. The prisoner begged leave to offer a few observations to the Court. He was proceeding to deny his guilt in the most solemn manner, when Mr. Justice Patteson said that he should have spoken when he was called on to say if he had anything to offer why judgment should not be passed upon him. However, the Court was willing to hear anything he had to say. The prisoner, in the most solemn manner, denied having had any felonious intention in putting the letter aside. He had totally forgotten the matter, and, when asked about it, he could not call to mind what had become of it. He was proceeding with a statement of some matters wholly irrelevant, but was stopped by the Court, and removed.—*Coining by the Electrotype.*—*John Green*, aged 36, and *Anne Green*, his daughter, aged 9, were indicted for making counterfeit coin. The male prisoner employed the electrotype process for plating the counterfeits, and the galvanic apparatus was found on his premises. The girl resisted the police officers when they entered the premises. The Jury found the male prisoner Guilty, and acquitted the girl. The prisoner begged for mercy, on account of his having a wife and a young family. Mr. Justice Patteson said that he should have thought of his family before he committed the offence. The Court felt called upon to pass a severe sentence, which was that the prisoner be transported for 15 years.—*Manslaughter.*—*Peter Watkins*, druggist, was indicted for the manslaughter of William Watts. From the evidence, it appeared that deceased had gone to the shop of the prisoner to purchase some tasteless salts, and prisoner gave him tartaric acid, it being proved on his behalf that this was the result of accident, and that the bottle containing the acid had been accidentally substituted for that which contained the salts. The Jury, under these circumstances, at once returned a verdict of Not Guilty, but at the same time expressed their opinion that there ought to have been some clear and distinct label upon the respective bottles, in order to distinguish their contents. Mr. Justice Erle said he concurred in what had fallen from the Jury. There certainly should be every pains taken to prevent such mistakes.

Miscellaneous.

A New Witness in a Court of Law.—The following extraordinary case has lately been decided at the College-green Police-office, Dublin:—Mr. Jones H. Davis, Anglesea-street, summoned Mr. Moore, of the Quay, for detaining a parrot, his property. Mr. Fullam appeared for the defendant. The complainant stated that he wanted to recover a stolen parrot (and here he pulled out a bundle of papers). If his worship permitted him, he would read a statement of the case. He was about to commence reading from the aforesaid papers, when Mr. Hitchcock interrupted, and said—Without reference to that paper, did you lose a parrot, and when? Complainant—Yes, your worship, I lost a parrot, and a very good one too. Mr. Fullam—The parrot is here, or at least outside the Court. Complainant—Then, bring in the bird, and I'll engage I'll soon prove my case by his evidence. Mr. Hitchcock—If the bird is to be examined as a witness, he ought not to be in Court; he must be subject to the rule of other witnesses. Complainant—Never fear, your worship; he will not say a word except the truth. Mr. Hitchcock—Well, go on, and let us hear your evidence at any rate. Mr. Davis said, on Sunday evening, the 28th of April last, he lost the bird, and did not see it after that until Friday evening last. (Here an immense cage, covered with cloth, was carried into the board room amid a shout of laughter. The cage was placed in the dock.) Witness—I will give up the whole matter if the parrot will not prove my case. He is my principal witness. Mr. Fullam—And do you swear, sir, that Mr. Moore stole him? Witness—No, certainly not, for I don't think he did; but it may have been stolen by some person, and sold to Mr. Moore; I lost it at all events, and it was either stolen or taken away, which comes to the same thing in the end, so far as I am concerned. The bird is now in Court, and let me take him on my finger and ask him two or three questions, and if he don't answer to my satisfaction and that of all present, I will give up the case. Mr. Fullam—Do you intend to have him sworn? If you do, I'd like to know on what book, as it is very likely he is a Heathen or a Turk. A voice behind—Get him a Koran, then—(laughter)—in the middle of which the parrot commenced whistling, "Take your time, Miss Lucy," amid a scene of the most boisterous mirth. Mr. Fullam—Let him be examined by you, and then I have a right to cross-examine him. What words did you teach him? Here the cage was uncovered, and the parrot stared about the board-room for some time, until Mr. Davis stepped over to him and said, "Come, old fellow, give me a kiss." The bird, which is a very pretty one, thrust its neck out of the twisted gyres, and kissed Mr. Davis with apparent fondness, whilst the by-standers were almost convulsed with laughter. A fat young fellow here came forward, and said that the bird would do the same to any one in the room, and therefore it was no proof that he belonged to Mr. Davis. Mr. Davis said that the parrot would not kiss any one but himself, and cautioned the lad not to try the experiment; but the advice was unheeded, and the boy, stepping over to the cage, asked for a *buss* also. The bird looked at him for a moment, bristled up its feathers, stretched out its neck, and seized the boy by the lip, out of which it nearly took a mouthful before it could be loosened, and the shouts of the lad mingled with the laughter had a very excellent effect indeed. Mr. Davis requested any other gentleman that pleased to ask the parrot for a kiss, but the invitation was politely declined by the whole of the company. He again begged the favour of a salute from the bird, which was granted, as in the first instance, with affection, and then he appealed to the bench and the audience if the kind bird was not his property. Mr. Hitchcock said the evidence was very strong in his favour certainly; but Mr. Fullam said his client was by no means satisfied with the proof adduced on that point. Mr. Davis—Very well (taking the bird out of the cage on the fore finger of his right hand), I will ask him a few questions now, and I think I will settle the matter, "Tell me, old fellow, what does the dog say?"—The answer was a bow, wow-wow, so loud and musical that one would imagine the "Kildare hounds" had run a fox into the board-room. When the laughter which followed had ceased, Mr. Davis again asked, "Well, what does the cat say?" The parrot gave a sly glance round the room, and then commenced purring a little, after which he set up mewing, which forcibly reminded every person present of a congregated meeting of all the tom cats in the city. Mr. Davis asked, Was there any more proof necessary? and Mr. Hitchcock said the evidence was quite conclusive, and he would order the bird to be returned to its original owner, Mr. Davis. Mr. Fullam said Mr. Moore was a most respectable person, and he could bring proof that he bought the parrot in July last for 1*l.* 13*s.* Mr. Hitchcock said that might be true, but it was quite clear the bird belonged to Mr. Davis, and he must therefore make an order for its restoration. Mr. Moore—And I am to be done out of my property in this manner? Mr. Davis—You admit that you bought the bird after the police notice was served on you (showing a printed notice). Mr. Hitchcock—You bought the bird after you read the notice, and I will not allow you anything for its support. The parties then left the office, the parrot whistling "There's nae luck about the house," amid loud and continued laughter.—*Dublin Freeman's Journal.*

Prolongation of Life.—A young American, who is travelling in Europe, gravely announces in a letter that Professor Van Grasselbach, of Stockholm, has brought to a state of perfection the art of producing a torpor in the system by the application of cold, of degrees of intensity proceeding from less to greater, so as to cause the human body to become perfectly torpid, in which state it may remain for a hundred or a thousand years, and then be awakened to a new existence.—*Morning Post.*

BIRTHS.—On the 26th ult., at Milton, the LADY F. MILTON of a daughter—2d inst., at Brighton, the lady of the Rev. H. GREEN, of a daughter—2d inst., at 7, Catherine-place, Limerick, the lady of Capt. H. LUGARD, Royal Engineers, of a son—3d inst., at Coleshill House, Berks, the Hon. Mrs. E. P. BOUVERIE, of a daughter—4th inst., at 57, Eaton-square, LADY R. GREVILLE, of a daughter—4th inst., at Clapham-rise, the lady of R. M. EVANS, Esq., of a daughter.

MARRIAGES.—On the 12th Nov., 1844, at Bellary, A. G. TWEEDIE, Esq., Madras Civil Service, eldest son of Dr. Tweedie, Montagu-place, Bedford-square, to ISABELLA FANNY LESLIE, youngest daughter of Major-General Leslie, K.H., commanding Bellary—1st inst., at the parish church of Lancaster, J. HATTON, Esq., surgeon, of Oxford street, Manchester, to JANE BURTON, third daughter of the late E. M. Burton, Esq., of Parkfield, Lancashire—2d inst., at the parish church, Bulteagh, Londonderry, J. CROSBIE, Esq., second son of the late Rev. J. Crosbie, of Ardfert Abbey, county of Kerry, to MARIANNE M'CAUSLAND, eldest daughter of Marcus M'Causland, Esq., Fruit-hill, county Londonderry.

DEATHS.—On the 1st inst., at Cheltenham, sincerely regretted by all her friends, LADY BURDETT, relict of the late Sir W. Burdett, Bart.—1st inst., at his residence in Carmarthen, Major-General Sir W. NOTT, G.C.B., of the Bengal Army, aged 62 years, 11 months, and 12 days—30th Dec., at Brighton, LADY WILMOT, relict of the late Sir Robert Wilmot, Bart., of Chaddesden, Derbyshire, aged 70—2d inst., FRANCIS SOPHIA FLETCHER, second daughter of Sir Henry and Lady Fletcher, of Ashley Park, Surrey, aged 4 years; and on the 4th inst., EMILY FLETCHER, eldest daughter of the same, aged 5 years—2d inst., at 47, Lansdown Crescent, Cheltenham, Mrs. M. HUME, daughter of the late John Hume, D.D., Lord Bishop of Sarum—3d inst., ANNA A. SWINBURNE, wife of Edward Swinburne, Esq., jun.—3d inst., at his brother's house, 6, Portland-place, Wandsworth-road, R. PATERSON, Esq., late of the firm of Coe and Paterson, solicitors, Size-lane, City, aged 28.

WANT PLACES.—All Letters to be post-paid.

AS FOREMAN in a Nobleman or Gentleman's Garden.—A young Man who has had considerable experience in Forcing Cherries, Peaches, Vines, Pines, &c., and is well acquainted with Orchidaceæ, Stove, and Greenhouse Plants. Unexceptionable reference can be given as to character and abilities.—Direct to S. O., 14, Shouldham-street, Bryanstone-square, London.

TO NOBLEMEN AND GENTLEMEN.

AS HEAD GARDENER.—A married Man, 40 years of age, with one child, 10 years of age. He is leaving his present situation in consequence of the death of his employer, with whom he has lived for the last 18 years, and practised, with success, all kinds of forcing. His Wife would undertake the charge of a Dairy. The most satisfactory references will be given as to his ability and moral rectitude. Wages, 70*l.* with house-rent.—Direct to X. Y. Z., Post-office, Richmond, Surrey.

AS HEAD GARDENER, in a Nobleman or Gentleman's Family.—A respectable person, who has had extensive and varied practice in several of the first rate establishments in the United Kingdom, and around the Metropolis, is at present disengaged. He is unmarried, and 28 years of age. Can produce testimonials of ability, and be highly recommended from a family of distinction, whom he successfully served.—Direct to A. Z., Rolfrough Inn, Horrabridge, Tavistock, Devon.

AS LAND STEWARD OR OVERSEER.—A Gentleman compelled by loss of health to resign the Civil Service of the H.E.I.C., and who has devoted several years to Agricultural pursuits, is now desirous of obtaining such a situation. The advertiser is 33 years of age, and unmarried. References of the highest respectability will be given.—Direct, M.M., 228, Piccadilly.

AS GARDENER.—A respectable Married Man, aged 36, who has an adequate knowledge of his business, and can have a good character from the gentleman he has just left, on account of his making alterations in his establishment.—Direct to L. Y., Mr. Cutbush, Highgate Nursery, Middlesex.

The Newspaper.

SATURDAY, JANUARY 18, 1845.

BRITISH MUTUAL LIFE ASSURANCE SOCIETY, 17, NEW BRIDGE-STREET, BLACKFRIARS. The British Mutual Life Assurance Society rejects the system of giving Bonuses at short periods, as contrary to the provident principles of Life Assurance, and adopts the lowest rates which the value of life can afford—thus giving to the Assured a sum annually, equal to bonuses every 2, 3, 4, and 5 years. The adjustment of the rates in the British Mutual to the several ages of life is worthy of attention, at middle life being between 20 and 25 per cent. lower than in most Offices, and at advanced life maintaining a favourable comparison with any, and gives the advantage of the *Tontine* to survivors of more than average life.

Prospectuses and every information may be obtained on application at the Office, 17, New Bridge-street, Blackfriars.

CHARLES JAMES THICKE, Resident Secretary.

FOR WINTER WRAPPERS, GREAT-COATS, AND OUTSIDE GARMENTS OF ALL KINDS, SEE

BERDOE'S VENTILATING WATERPROOF CLOTHING ESTABLISHMENT, 69, Cornhill, where an inspection is confidently invited of a large and Superior Stock of first-rate garments of the above description, at reasonable charges, and really waterproof. Also of Berdoe's well-known FROCK for all Seasons (which has stood the test of more than six years' extensive trial, and completely supersedes the "Macintosh"), SHOOTING JACKETS, &c. The above made to measure at same charges in a few hours.
W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (North-side.)

NERVOUS OR MENTAL COMPLAINTS.—A PAMPHLET on these COMPLAINTS, by REV. DR. WILLIS MOSELY, will be sent to every ADDRESS, free, if a stamp is inclosed, to 9, Charlotte street, Bloomsbury. This is the only new and successful treatment known to administer relief to a diseased mind, or to cure NERVOUS or MENTAL COMPLAINTS—a thing that can now be done as certainly as the cure of any bodily complaint.

News of the Week.

THE Repeal question in Ireland has been thrown into the shade by an agitation of a very different and unexpected character. The Bequests Act, as our readers are aware, has created a difference of opinion not only among the Catholic laity but among the higher orders of the clergy. The excitement occasioned by this measure had in no degree subsided, when it was rumoured that the Government had opened a negotiation with the Pope for the purpose of connecting the Irish Catholic Church with the State, either by making a provision for the clergy, or by obtaining a *concordat* giving the Crown the nomination of the prelates. This rumour apparently took all parties by surprise; but before there had been much time for the expression of public opinion on the subject, Archbishop Crolly, the Catholic Primate of Ireland, published a letter addressed to him by the Propaganda, at the command of the Pope, charging him to admonish all ecclesiastics, and especially those of episcopal rank, to abstain from taking any part in political meetings or dinners, and "studiously to avoid what may even lightly excite or agitate the flock committed to them." Mr. O'Connell at once pronounced this letter to be not a "canonical document," and the Primate consequently thought it necessary to publish a letter to Mr. O'Connell, expressing his "surprise and sorrow that he should have ventured" to make such an assertion, and stating that the document had been submitted to all the prelates of his Church, who had agreed to abide by its injunctions. The Archbishop in a postscript referred to the *concordat* as an "insidious scheme" which he will join the prelacy of Ireland in opposing as destructive of the independence and purity of their religion. These facts will suffice to show that the rumoured negotiations with the Pope had obtained very general credit. The letter of Archbishop Crolly however has had the effect of producing an official communication from the Lord-Lieutenant, which sets the whole question at rest. On Wednesday, Lord Heytesbury addressed a letter to Archbishop Murray, informing him "that he has been instructed to give to him and to Archbishop Crolly the strongest assurances, on the part of the Government, that there has never existed the slightest intention of entering into any negotiation with the Papal See upon the subject of a concordat." In the meantime the letter received by the Primate from the Propaganda is so obviously directed against the Repeal agitation, that it has roused a general spirit of hostility to the Pope among all classes of Repealers. The meeting of the Association on Monday was almost exclusively occupied with this topic, and no Protestant speakers in the days of the "No Popery" agitation could have surpassed the leading Catholic members of the Association in the vehemence of their protestations against the Pope's right to interfere in the temporal affairs of the people of Ireland.—The question of the rubric, which has for some time been the prevailing topic in the Church of England, has been brought prominently before the public this week by a letter from the Archbishop of Canterbury to the clergy and laity of his province. The Archbishop recommends the clergy to abstain from any further attempt to introduce changes in the Church service, unless they are acceptable to the laity, and to let matters generally remain as they are, until the "way shall be prepared for a final settlement." In consequence of this letter, the Bishop of Exeter has withdrawn from the contest with the laity of his diocese, and has declared that he thankfully accepts the prospect of an adjustment of their present diversities by some general measure which shall have the sanction of the whole Church.

In France, the Ministerial crisis has received a fresh impulse from an unexpected attack of Count Molé on the foreign policy of the Government. Count Molé's speech may be regarded as the manifesto of the Cabinet which will succeed that of M. Guizot, whenever he is compelled to retire. The great points of his speech were the right of search and the protectorate of Tahiti, both of which Count Molé described as difficulties from which, in spite of their concessions to this country, the Cabinet could not extricate themselves without making either England or the Chamber of Deputies give way. M. Guizot's reply will be read with general interest. He stated that the British Government had so far made concessions as to agree to the appointment of a mixed commission to discuss the right of search with a view to its abolition, and to inquire into some means of putting down the slave-trade by means as efficacious but less obnoxious to the prejudices of France. This important announcement did not produce much effect upon the Chamber, and although it is believed that the division on the address will be in their favour, the impression made by the debate is unfavourable to the stability of the Cabinet.—The annexation of Texas is the chief topic in our news from the United States. President Tyler has made another effort to precipitate the question, and although the more popular branch of the legislature is in favour of his views on this subject and on the occupation of the Oregon territory, it is believed that the Senate will reject both measures.—A report was current in the city on Thursday, of the death of the Emperor of Russia. The accounts came from the Bourse either of Frankfort or of Amsterdam, and various circumstances combine to prove that it is, at least, of doubtful origin, and perhaps altogether traceable to some stock-jobbing device. It is certain that the Emperor has never completely recovered the loss of his daughter, but no intelligence has reached the Russian Embassy or the Foreign Office which would give credence to the report of His Majesty's death. Indeed, the last news from St. Petersburgh which reached the Embassy does not state that the Emperor was suffering even from indisposition.

Home News.

COURT.—On Sunday the Queen and Prince Albert, with the Royal Suite, attended Divine service in the private chapel of the Castle. On Monday the Queen and Prince took their usual early walk, but the unfavourable state of the weather prevented Prince Albert from taking a shooting excursion in the royal preserves. In the afternoon the Queen held a Privy Council, which was attended by the chief officers of State, at which some reports relative to Guernsey, &c., were submitted to Her Majesty, and received. In the evening the Queen and Prince Albert took equestrian exercise in the Riding-school. On Tuesday Her Majesty and the Prince promenaded in the pleasure-grounds, and on Wednesday took their departure for Stowe, on a visit to the Duke of Buckingham, the particulars of which will be found under its proper head. The Marchioness of Douro has succeeded the Countess of Charlemont as the Lady in Waiting; Viscount Sydney has succeeded the Earl of Warwick as Lord in Waiting; and Captain the Hon. Nelson Hood has succeeded Captain the Hon. A. Duncombe as Groom in Waiting on Her Majesty.

HER MAJESTY'S VISIT TO STOWE.—On Wednesday morning, the Queen and Prince Albert, with their suite, left Windsor Castle for Stowe, on a visit to the Duke of Buckingham. The royal party came to town by a special train on the Great Western Railway, and on arriving at Paddington Her Majesty proceeded to Cambridge House, to pay a visit to the Grand Duchess of Mecklenburg Strelitz, after her recent confinement. After remaining about 20 minutes with her Royal Highness, the Queen and Prince proceeded to the Euston-square terminus of the Birmingham Railway, where they were conducted by the directors to the state carriage of the company. The special train started soon after 12, and arrived at Wolverton Station, 52½ miles, in 1 hour and 20 minutes. At Wolverton the Queen was received by Lord Carington, Lord Lieut. of the county, and a guard of honour of the Bucks Hussars, who escorted Her Majesty through Stony Stratford and Page Hill to Buckingham. The line of route was decorated by numerous triumphal arches, and the people assembled in great numbers, and welcomed Her Majesty with loud cheers, although the weather in the early part of the day was by no means propitious for the display of their loyalty. At Buckingham, however, the sun shone out before the arrival of the royal party, and the town was gaily decorated with festoons and triumphal arches. Shortly before 3, the approach of the Queen was announced by a salute from the Corporation battery, and the royal procession passed through the town at a foot pace, headed by the Mayor and Corporation, the clergy, and the members for the borough, and welcomed by repeated cheers from the multitude, who lined the streets, and occupied every available spot which commanded a view of the main streets. On reaching the market-place, the Mayor presented the mace to the Queen, who returned it with the usual compliments, after which the royal carriages passed along the Stowe-road, and proceeded rapidly towards the mansion. At an early hour the labourers employed in the various parishes belonging to the Duke of Buckingham, to the number of 500, all dressed alike, in white smock frocks, with green ribbons round their hats, began to arrive in the park, arrangements having been made for them to assemble opposite the north front of the house upon Her Majesty's arrival. A very large body of the Duke's tenantry, all excellently mounted, and wearing green favours, inscribed with "God save the Queen," also assembled in the park for the purpose of forming an "agricultural" guard of honour to the Queen, upon Her Majesty's arrival in the vicinity of the mansion. A guard of honour of the Bucks Hussars was also stationed in the open space on the north front. The royal carriage drew up at the grand portico shortly before 4. Upon alighting Her Majesty was received by the Duke and Duchess of Buckingham, whom Her Majesty greeted in the most affectionate manner, and taking the arm of her noble host, entered the mansion amid the shouts of the tenantry and labourers assembled, the Yeomanry band playing the national anthem. Prince Albert followed, with the Duchess resting on his arm. Her Majesty was conducted by the Duke through the north hall to the grand saloon, where the guests already arrived at the mansion were assembled to receive the royal visitors. The Marquis of Breadalbane, the Earl and Countess Delawarr, Lady Mary West, the Earl and Countess of Orkney, the Countess of Jersey, Lady Clementina Villiers, Lord and Lady Nugent, and Dr. Buckland, were among those present, and Her Majesty having bowed to each, was proceeding, under the guidance of the Duke of Buckingham, in the direction of the private aparments, when with an evident desire to gratify those of her loyal subjects by whom she had been so cordially received on the Noble Duke's estate, Her Majesty requested to be reconducted to the exterior of the mansion. The Duke immediately led Her Majesty to the west colonnade, along the greater part of which the Queen proceeded amid the loyal cheers of the tenantry and labourers, who were evidently both delighted and surprised at Her Majesty's reappearance. The Queen subsequently entered the mansion, and retired to her private apartments. The dinner-party in the evening included all the visitors at Stowe, with the addition of several of the local gentry, the royal suite, with the Earl of Aberdeen, Sir Robert and Lady Peel, and Sir J. Graham, who left town on purpose to meet Her Majesty on the occasion. In the evening the mansion of Stowe and the town of Buckingham were brilliantly illuminated. A guard of honour, consisting of the carabineer troop of the Bucks Hussars, under the command of Capt. Carrington, was on duty during the evening at the mansion, and will remain on duty night and day during Her Majesty's stay. On Thursday Her Majesty rose early and breakfasted in her private room with Prince Albert, and at 9 o'clock attended morning prayer in the Duke's private chapel. Her Majesty and the Prince occupied the gallery, which is entered from the suite of apartments appropriated to the Queen's use, the other guests taking their seats in the body of the chapel. Prayers were read by the Reverend Mr. Andrewes, the Duke's private chaplain. At 10 o'clock, Her Majesty and the Prince walked in the pleasure-grounds alone, remaining absent from the house, however, only a short period. At half-past 10 his Royal Highness, accompanied by the Duke of Buckingham and Sir R. Peel, left the mansion in an open barouche, drawn by four horses, for the purpose of shooting in the preserves, on the outskirts of the park. The following gentlemen followed on foot:—The Earls of Jersey, Orkney, and Delawarr, Sir J. Graham, the Marquis of Chandos, Colonel Bouverie, and Mr. G. E. Anson. His Royal Highness and the rest of the party had excellent sport, and after being absent about two hours, returned with an enormous quantity of game. The Prince shot with his own gun 114 hares, 29 pheasants, and one snipe. The other gentlemen killed largely, but the number bagged by his Royal Highness was by far the largest. At 2 o'clock Her Majesty and the Prince lunched with the other guests, and shortly after 3 the whole party left the house for the purpose of perambulating the grounds. The carriages had been ordered, but as the afternoon turned out delightfully fine Her Majesty decided on proceeding on foot. The additions to the dinner-party in the evening were—Sir T. Fremantle, and Sir J. Chetwode, the members for Buckingham; Mr. Barnes, of Charlewood, high Sheriff of the county; Sir Harry and Lady Verney, and Mr. Henry Smith, the Mayor of Buckingham.

Accouchement of the Hereditary Grand Duchess of Mecklenburg Strelitz.—Her Royal Highness, late the Princess Augusta of Cambridge, was safely delivered on Monday morning of a Prince, which survived its birth only a few minutes. The latest bulletins state that Her Royal Highness is going on perfectly well.

Cabinet Council.—A Council was held on Saturday, and another on Tuesday at the Foreign Office, at which all the Ministers were present. Both Councils sat three hours.

Elevation of Sir C. Metcalfe to the Peerage.—The

Morning Herald of Thursday announces that it has authority to state that the Queen has been graciously pleased to confer a peerage on Sir Charles Metcalfe, Governor-General of Canada, by the title of Baron Metcalfe, of Fernhill.

Legal Changes.—A paragraph, which first appeared in the *Globe*, has been going the round of the papers, mentioning the rumour of important changes in the law officers of the Crown. The accuracy of the statements has been denied by the Ministerial journals, and they must therefore be received with doubt. According to the rumour, Mr. Pemberton Leigh was to be Lord Chancellor, *vice* Lord Lyndhurst, who retires; Sir F. Thesiger, Chief Justice of the Common Pleas, *vice* Sir N. Tyndal, who retires. Mr. Fitzroy Kelly, Attorney-General, *vice* Sir W. Follett, who retires from ill health. The Hon. Mr. Wortley, Solicitor-General, in the place of Sir F. Thesiger. In answer to these statements the Ministerial papers state that the Lord Chancellor is in excellent health and spirits; that neither he nor Chief Justice Tindal has expressed any immediate intention of resigning; and that Sir W. Follett's return in renovated health is expected in three weeks.

The Church.—The following letter has been addressed to the Clergy and Laity of his Province by the Archbishop of Canterbury, on the present condition of the Church. This document will be read with such general interest throughout the country, that we give it without abridgment:—

"For a considerable time past my attention has been anxiously turned to the divisions in the Church, occasioned by differences of opinion with respect to the intention of certain rubrical directions in the Liturgy, and diversities of practice in the performance of Divine service. These questions, relating to matters in themselves indifferent, but deriving importance from their connection with the maintenance of uniformity and order in the solemn ministrations of the Church, are rendered difficult by the ambiguity of the rubrics in some instances, and in all by the doubts which may arise as to the weight which should be allowed to general usage when it varies from the written law. It is partly on these accounts, and partly from uncertainty with respect to the extent of the powers committed to the Archbishop of the province, in the preface to the Book of Common Prayer, for the resolution of doubts in regard to the contested points that I have not felt myself justified in expressing an authoritative opinion upon questions occasionally submitted to me on these subjects. I was, indeed, willing to hope that these controversies, like many of much greater importance which have for a season disquieted the Church, would be suffered to die away of themselves, when the arguments on each side had been thoroughly sifted, from the good sense of the parties engaged in them, and the general conviction of their unprofitableness. But having been disappointed in this expectation, and considering the tendency of continued agitation to weaken the sacred bonds of affection which ought to unite the clergy and laity as members of one body in Christ, I hold it a duty to come forward, in the hope of allaying animosities, and putting a stop to dissensions which are shown by experience to be not only unedifying but mischievous. With this view I would call your attention to a few considerations, which, with persons who are desirous of peace, will, I trust, have their due weight. It has long been observed that, in the performance of Divine service in the generality of our parochial churches, there has been a deviation, in certain particulars, from the express directions of the rubric, and that, in some cases, a difference in respect to the sense of the rubric, has led to a diversity in practice. In regard to such points, in themselves non essential, the most conscientious clergymen have felt themselves justified in treading in the steps of their predecessors; and hence the irregularity (for all departure from rule is irregular), which seems, in some instances at least, to have existed from the beginning, became inveterate. There have, I apprehend, at all times been clergymen who have been distressed by this inconsistency; and of late years it has been regarded by many excellent men as irreconcileable with the obligations which they took upon themselves on their admission into holy orders. Under the influence of these scruples, they thought it right to adhere as closely as possible to the letter of the rubric in their ministration; whilst others of their brethren, not less conscientious, have been determined by considerations, in their estimation of great weight, to follow the usage which they found established in their respective churches. Under these circumstances a diversity of practice has arisen, which is not only inconsistent with the principle of uniformity maintained by the Church, but is sometimes associated in the minds of the people with peculiarities of doctrine, and gives birth to suspicions and jealousies destructive of the confidence which should always subsist between the flock and their pastor. To prevent the increase of an evil which might terminate in actual schisms was confessedly most desirable; and the most effectual mode of accomplishing the object, it has been thought, would be found in general conformity to the rubric. Universal concurrence in this easy and obvious regulation would have combined the several advantages of securing compliance with the law of the Church and the land, of putting a stop to unauthorised innovations, and of excluding party distinctions, in their character decidedly unchristian, from the public worship of God; and I cannot but regret the measures which, with a view to these good purposes, have been recommended by high authorities, should not have been received with unanimous acquiescence, as the means of restoring order and peace, without any departure from the principles of the Church, or offence to the most scrupulous conscience. At the same time, I am sensible that those who object have much to allege in their justification. If the written law is against them, they plead an opposite usage, in parochial churches at least, reaching back, perhaps, to the time when the intention of the lawgiver was best understood, superseding its literal sense, and determining its real meaning; they appeal to the general consent of Bishops, clergy, and laity, implied in the absence of any effectual interference during so long a period; they object to the sudden revival of rules, which in their opinion are obsolete, and still more to their rigid enforcement after so long a term of abeyance. In fairness to them we must allow that this dislike of alterations in the manner of worship to which they have been accustomed from their infancy, proceeding as it does from attachment to the ordinances of the Church, ought not to be visited with unkindly censure; and we can hardly be surprised at any change being regarded with suspicion when so many attempts have been made to introduce innovations which are really objectionable, and tend, as far as they go, to alter the character of our Church. It must also be granted that the intention of the Church is not always clearly discoverable from the language of the rubric, nor determinable with absolute certainty from the records of early practice. In such cases it may with some show of reason be said, that, as the eminent men to whom the several revisions of the Liturgy were successively intrusted, did not see the necessity of giving directions so precise as to insure a rigid conformity in every particular, we may be contented to acquiesce in slight deviations from rule, suggested by convenience and sanctioned by long usage. Now, whatever may be the force of the arguments on either side, a difference of opinion will, probably, always exist in regard to the contested points. But all parties will concur in regarding those points as of far less importance than the maintenance of that mutual confidence which, next to support from above, forms the main strength of the Church, producing the harmonious co-operation of its several members, and disposing the people to look up with reverence to their pastor as their spiritual instructor and guide. In whatever degree, or by whatever means, the tie of affection is loosened, a proportionate diminution will follow of that moral influence on which the efficiency of the clergyman's teaching will always depend. The case, then, if fairly considered with reference to the existing dissensions, and the results to be expected from their continuance, will show the necessity of mutual forbearance to the peace and the honour, I may even say to the safety, of the Church. The laity, it may be hoped, will see the propriety of respecting the consciences of such of the clergy as have held themselves bound to strict compliance with the express direction of the rubric, without regard to former disuse; and the clergy will perceive the expediency of not pressing too harshly or abruptly the observance of laws which, having by themselves and their predecessors been long suffered to sleep, have now the appearance of novelty. I am fully alive to the importance of uniformity in the celebration of Divine service; but I think it would be purchased too dearly at the expense of lasting divisions—a consequence which, I trust, will be averted by a suspension of the existing disputes. My hope of such an adjustment is grounded on the wisdom, temper, and piety, which are engaged on both sides of the question. A settlement which would have the sanction of law is at the present moment impossible; and, were it possible, could hardly be attempted with hope of success, till the subsisting excitement has been allayed by time and reflection. But till that time shall arrive, our regard to the spiritual interests of our brethren ought surely to put a stop to contentions, which, besides the offence against charity, engage much time and ability which might be infinitely better applied, and which can afford pleasure only to those who bear ill-will to our Church. The matters in controversy, considered in themselves, are not of vital importance; the service in our churches has in general been conducted in conformity to the Apostle's direction, with order and decency; and, whether performed with exact regard to the letter of the rubric, or with the variations established by general usage, will still be decent and orderly. I, therefore, entreat you to consider whether the peace of the Church should be hazarded by prolonging an unprofitable controversy, at a time, more especially, when her energies are directed, with such hope of success, to the promotion of religion and morals, and when the clergy and laity are zealously engaged in united exertions for the erection and endowment of churches and schools, and for other pious and beneficial objects, in almost every part of the country. What I would most earnestly recommend, for the present, is the discontinuance of any proceedings, in either direction, on the controverted questions. In churches where alterations have been introduced with general acquiescence, let things remain as they are; in those which retain the less accurate usage, let no risk of division be incurred by any attempt at change, till some final arrangement can be made with the sanction of the proper authorities. In the case of churches where agitation prevails, and nothing has been definitely settled, it is not possible to lay down any general rule which may be applicable to all circumstances. But is it too much to hope that those who are zealous for the honour of God and the good of His Church, will show, by the temporary surrender of their private opinions, that they are equally zealous in the cause of peace and charity? On the particular questions which disquiet the public mind, I think it unadvisable to pronounce an opinion. Upon careful examination, I have found reason to think that some of these questions are more difficult of solution than is commonly imagined, and that the meaning which occurs at first sight is not always the most correct. And the general question, in respect to what should be conceded to usage in controlling or modifying the written law, seems to me to be open to much doubt. But, if I were ever so fully persuaded in my own mind, I should be unwilling, for reasons already assigned, to pronounce a judgment which, not having legal authority, might be accepted by some and disregarded by others, and might thus increase the confusion which it was designed to remedy. For similar reasons I have not thought it expedient to call the Bishops of my province together at this time, though it will be my desire, as well as my duty, to seek their advice and assistance when a fit opportunity presents itself. I am, however, fully assured of their general concurrence in deprecating the continuance of discussions, which will undoubtedly multiply strife and contention, but which, in the present posture of things, can lead to no beneficial result. In order to guard against misapprehension, I think it proper to state, that all I have here said is strictly confined to the rubrical questions which have occasioned the present agitation. All change in the performance of the service, affecting the doctrine of the Church, by alteration, addition, or omission, I regard with unqualified disapprobation. I may further remark, that the danger to the Church would be great, if clergymen, not having due respect either to episcopal authority or established usage, should interpret the rubric for themselves, should introduce or curtail ceremonies at pleasure, or make Divine service in any way the means of expressing their own theological opinions or party views. In respect to the Ritual, the preface to the Book of Common Prayer directs all persons having doubts, or diversely taking anything in the performance of the Church service, to resort to the Bishop of the diocese for the resolution of such doubts, and the appeasing of diversities. Had due attention been paid from the first to this salutary rule, the Church might perhaps have been saved from much of the dissension which at various times has divided her members, and grieved and perplexed her rulers, and which, if not speedily checked, may again cause a serious disturbance of her peace. Considering the course I have suggested as offering the only immediate means of averting such a calamity, and at the same time preparing the way for a final arrangement at a convenient season, I earnestly recommend its adoption, in the hope that, through the blessing of God, it may lay the foundation of lasting peace; 'and to this end'—(I borrow the words of a learned and pious ritualist)—'to this end may the God of Peace give us all meek hearts, quiet spirits, and devout affections, and free us from all prejudice, that we may have full churches, frequent prayers, and fervent charity; that, uniting in our prayers here, we may all join in His praises hereafter, for the sake of Jesus Christ our Lord. Amen.'

Lambeth Palace, Jan. 11, 1845. W. CANTUAR."

The Crown Jewels.—The claim of the King of Hanover to a large part of the Crown jewels has been heard this week by the Lord Chancellor and two other learned Lords, who, after hearing counsel, are to draw up a report for Her Majesty's guidance. Sir Charles Wetherell appeared for the King of Hanover, the Solicitor-General and Sir T. Wilde (the Attorney-General being absent) for the Queen. There is said to be no doubt that family jewels belonging to the house of Hanover, to the amount of 50,000*l.* or 60,000*l.*, were brought over by George I., and have been mixed up with the English Crown jewels; but as they have been frequently re-set, it has become impossible to identify them.

Official Appointments.—Mr. Frederick Goulburn, son of the Chancellor of the Exchequer, has been appointed to the vacant seat at the Board of Customs, caused by the death of the Hon. H. Legge. Dr. Bateman, chief clerk to the late Mr. Mayow, the assistant solicitor to the Excise, has been appointed the successor of that gentleman. The salary will in future be 1000*l.* per annum. Mr. Carr, son of the late Mr. Morton Carr, who formerly held the appointment of solicitor to the Excise, at which time it was worth 4000*l.* per annum, has been appointed to that situation, in the room of the late Mr. Dohmey.

Foreign.

FRANCE.—The Ministerial crisis is still a prolific source of discussion in the newspapers; and as nothing further can be known of the actual fate of the Ministry until after the debate in the Chamber of Deputies on the Address, which is to commence about the 20th, it is probable that we shall have a month more of disputation and recrimination. The Chamber of Peers assembled on Saturday afternoon, when their committee presented the draft of their projected Address. This is, in most respects, but a mere repetition of the royal speech, and the following are the only passages which are likely to interest our readers:—

"Your Majesty assures us that the intercourse between France and England has not been altered by certain discussions which might have endangered it. We congratulate ourselves on this, Sire, with you, being well convinced that the government of your Majesty is persevering in its efforts to smooth down, in a manner conformable to the dignity and interests of France, the difficulties which might menace the peace of the future. The good intelligence of the two states is necessary for the repose of the world; the interests of civilisation and of humanity are involved in it, and the high degree of prosperity enjoyed by the two grand nations which have equal claims to the esteem of each other, depend on it. May a mutual spirit of equity always preside over their relations! The visit which your Majesty made to the Queen of Great Britain, the reception which you received, the spontaneous manifestations which burst forth in every direction along your route, express in an unequivocal manner the sentiments of the whole nation. Your presence at Windsor, Sire, the striking testimony of an intimate and reciprocal friendship, will not have been barren of results. It will have afforded a happy occasion to the inhabitants of the two nations to better appreciate, to understand each other."

After the above draft was read, the following amendment was laid on the table of the Chamber, by the Marquis de Boissy, for the discussion on the Address:—"The Chamber of Peers earnestly looks forward to the day when a negotiation, long since commenced, shall have the effect of replacing our navy under the exclusive protection of the national flag." At the sitting on Monday, the following was laid on the table by the Duke d'Harcourt:—"Justice is, however, the surest guarantee of peace, and your Majesty will not forget, without doubt, that amongst the nations anciently allied to France there is one of which the existence has been solemnly recognised by treaties." The debate on the Address was then commenced by Count Molé, M. Guizot's most formidable opponent, who began by

Disavowing all the intentions attributed to him of joining any coalition to overturn the Ministry. But though he did not condescend to enter into any measures whatever against the government, yet he must declare that he altogether disapproved of the policy which it pursued; the system of making concessions to England on every occasion could not, he thought, be too much reprehended. The question of Tahiti and the right of search had been treated altogether with a view to satisfy England, and with little attention to the honour of France. He considered that the utmost injustice had been exhibited in the conduct of the French Cabinet with respect to the taking possession of Tahiti. The country felt this, and he did not think the Government would be able to justify their conduct. On the right of search, also, the Government had not acted according to the engagement which the Minister of Foreign Affairs had entered into with the Chamber. The answer given last year was that negotiations were pending on this question; but he had to remark that if the treaties of regulation of the treaties was not effected, nothing would be done. Count Molé then adverted slightly to Morocco, saying that he should treat of the proceedings in that quarter of the world at a later period of the debate. He then alluded at some length to the desire evinced by the present Ministry to do everything to preserve peace, and concluded by declaring that he was completely opposed to the Ministerial policy. M. Guizot complained that the noble Peer had taken notice of public reports relating to a coalition, such as ought never to have been brought before the Chamber. For his own part he had never, for the sake of his own personal interest, engaged in any matter contrary to the well being of the country. The noble Peer had not even indicated the particular points that ought to be brought against the present Cabinet. They had preserving peace, and of being intimately allied to England, but it been mentioned by Count Molé as subjects of blame, but defied any man, if he examined the question, to assert that any point between the two countries, to assert that any point had been yielded which the dignity of France could not claim. He denied that any concession could be said to be of a humiliating character for the Cabinet. He thought the question that had not been so satisfactorily arranged as to prevent all except certain revolutionary factions. The Minister then spoke at great length of the English alliance. He believed that however the opponents of the Ministry might succeed, they could carry on the government, if in power, by an alliance with England, though without being of such an intimate character as they were greatly mistaken. That alliance must be of the most intimate character, or of a nature soon to be broken. The peace of the world. The Minister then adverted to the right of search, and expressed his hope that the question would be settled by intelligence of the two Cabinets, bringing that question to a satisfactory conclusion. On the points of Tahiti, Morocco, and the other questions mentioned in the speech, he had no doubt of satisfying the Chamber. The Minister then attacked Count Molé for his opposition, and intimated that he had joined those persons who were anxious to attack the Government for that point, in order to remove it from power. The Minister defended by expressing his certainty of being able to defend himself and the Government.—Count Molé would repeat that France had the right of search questions had most strongly condemned the peace during the interval between the two treaties. He maintained that the Minister would never have agreed to the treaties on the latter question had he known at the time what the results of such a measure would have been. It was dangerous in its application, how hostile out to its real spirit, how disagreeable to the feelings of the French people. It was true that he (Count Molé) had formed part of the Cabinet which had examined this question. But what he had done was his personal opinion. He must remind

what the Chamber demanded was not a negotiation to alter the existing treaties, but a total change in the system. Now he denied that any plan of alteration could be devised that would satisfy the English nation. There was in that country a strong party who ardently pursued the abolition of slavery, and who insisted on the right of search as an indispensable complement of the general plan which had been determined on in England for the purpose. The English Cabinet must therefore be prepared to incur the disapprobation and strong opposition of this party in any attempt it might make to meet the views of the French people. What mode, therefore, could the Minister bring forward to satisfy the wishes of the Chambers, and to fulfil the engagement which he entered into so solemnly last session and the preceding one? He again would declare and maintain that this question and that of Tahiti were far from being concluded, and that both would hereafter be productive of very grave complications in the affairs of the two countries. The Minister must, he considered, be aware of this himself, though it suited his purpose at present to represent the state of the two questions as being in a favourable position, in order to get out of his present difficulties. If the Minister examined his portfolio he would find a proof, far more powerful than words that could be spoken in that Chamber, of difficulties that must yet attend the Tahiti affair, Had not a number of French subjects been killed? Had not a missionary been killed? Would the Minister, he should like to know, be ready to demand satisfaction for the loss of life of French subjects? It was most probable not; for he had but shown too great a readiness to yield to England on all points, to venture on any step that might prove distasteful to the Cabinet of that country. Such was his conscientious opinion, and he was convinced that neither affair was terminated, but that great embarrassments would yet arise by sea and land.—M. Guizot would not at present enter on the discussion of the two questions just alluded to by the noble peer, as it would take too much time to do so during a general discussion. He would not ask a single peer to vote for the Address who was not satisfied that his assertions were fully borne out. He was quite ready to acknowledge that the present system of the right of search had lost much of its efficiency for the prevention of the slave-trade. What he wanted to achieve was, to effect such changes in the method of its application as might render it of service for the object which it was originally intended to effect, and at the same time, to satisfy the feelings of the two nations. This problem was, it was true, a most difficult one, and yet he hoped shortly to be able to declare that he had carried his object. The English Government had just consented to searching with them the solution of that problem. The Ministry believed that the present system of repression had lost much of its efficiency, and that it had become irksome to the relations of the two countries; and at the same time they wished to continue to pursue the slave-trade, and to repress it with the same zeal. Commissioners animated with the same zeal are to be instructed to devise the means of doing so. Count Molé had said that what they aimed at is impossible. He firmly hoped, however, that he was mistaken, and that two enlightened Governments, animated with reciprocal good will, and firmly determined on persevering in the great work they had undertaken together, would in every case succeed in accomplishing it.

Viscount Doubouchage, Count St. Priest, Count Boissy d'Anglas, and the Marquis de Boissy, afterwards addressed the Chamber, when the general discussion was declared to be closed, and the debate on the separate paragraphs commenced. Count de Montalembert began by a speech in favour of the French Church, but the Chamber having adjourned before he had concluded, he continued his address on Tuesday, but the subject did not excite much interest after the important attack of Count Molé on the previous day. The Keeper of the Seals, M. Martin du Nord, replied in defence of the privileges of the University, and a discussion then arose on the affairs of the Polytechnic School, in which several members attacked the recent measures of Government in relation to that establishment, but they were vigorously defended by Marshal Soult.—The Marquis de Boissy next attacked the commercial policy of Ministers, after which the first paragraph was adopted. The Ministers, during the past week, have laid before the Chambers numerous documents relative to the occurrences at Tahiti and the late quarrel with Morocco. These documents are necessarily a repetition of facts already known, but they are stated, of course, with official minuteness. One of the most interesting to English readers is the despatch of Count de Jarnac, the French Chargé d'Affaires in London, in which he informs his Government of the impression made on this country by news of the imprisonment and expulsion of Mr. Pritchard. "Never," he says, "since my arrival in London have I seen an incident of external politics make such an impression. The religious party, so powerful by itself, so influential by its affinities with the most exalted sentiments, as well as with the blindest prejudices of this country, have been the first to bestir themselves. Meetings of *saints* have been convoked throughout England, violent and bitter speeches have been delivered, prints and engravings have been disseminated, reproducing M. d'Aubigny's proclamation of the 3d of March, and representing the various circumstances of the arrest and imprisonment of Mr. Pritchard; nothing, in short, has been omitted to procure him popular sympathy and to raise him to the rank of the martyrs of the Evangelic faith."—Marshal Soult on Thursday, as President of the Council, laid before the Chamber a Bill for granting a pension of 15,000 francs to M. Villemain, the late Minister of Public Instruction, in the way of a national reward. The pension is to revert to his wife, in the event of his dying before her, and to his three daughters. The Chamber repaired afterwards to their bureaux, and selected the committee which is to report upon the Bills relative to the supplementary and extraordinary credits for 1844 and 1845. The Ministerial candidates prevailed in almost all the bureaux.—That the return to France of M. Dupetit Thouars was expected to prove a severe blow to the Cabinet, may be inferred from a conspicuous article of the *National*, the collector of the subscriptions for his "sword of honour." It asserts that all the officers of Admiral Parseval's squadron, which was sent to Naples on the occasion of the marriage of the Duke d'Aumale with the Princess de Salerno, declined attending a ball given by the French Ambassador to the Duke and the Neapolitan Court, in consequence of the Prince de Joinville, who was present, not having, as a naval officer, resented the "disavowal" of Admiral Dupetit Thouars. The Duke de Joinville, it is added, has been severely reprimanded by the King, and has been ordered to return to France

second message from President Tyler, discussing the relations of the United States with Mexico, denouncing in forcible language the diplomacy of Mexico, and virtually adopting and justifying the tone adopted by Mr. Shannon in the correspondence with Senor Rejon, expressing a belief that the conduct of Mexico towards the United States might well justify a resort to any measure to vindicate their national honour, and concluding by re-urging upon Congress prompt and immediate action upon the subject of annexation. Fortunately, Congress seems little disposed to adopt or sanction the belligerent spirit of Mr. Tyler. The message had been referred to the Committee on Foreign Relations in both houses. The Oregon territory question had been discussed in the House of Representatives, with anything but a friendly feeling to the presumed rights of this country. In all probability a Bill will pass the more popular branch of the Legislature for the erection of military posts on the Oregon. The Senate—the only Conservative public body in America—may, and probably will, throw it out. The composition of that body, as at present constituted, is not very favourable to the views of Mr. Tyler; and it is, perhaps, fortunate for the peace of the world that it is so.—The Sub-Treasury Bill, so intimately connected with the name of Mr. Tyler, who has twice or thrice vetoed it, had again passed the House of Representatives by a large majority; and it will also, in all probability, pass the Senate—to be again thrown aside by the veto of the retiring President. The subject of the tariff had been incidentally discussed in the House of Representatives, arising out of a motion to lower the duty on iron imported for railway purposes. The feeling of the House was expressed strongly on the proposition, so that, however the tariff may fare in the next session of Congress, no change seems likely to be made in it during the present one.—Another joint resolution providing for the annexation of Texas to the United States, "in conformity with the treaty of 1803 for the purchase of Louisiana," was making way through the House of Representatives, having been introduced, read a first and second time, and referred to the Committee of the whole House, in one day.—Some additional papers respecting the relations of France and the United States had been laid before the Senate, from which it appears that M. Guizot had assured the American Minister in Paris that France had not joined with England in protesting against the annexation of Texas, a measure, says Mr. Calhoun, the Secretary of State, "which both countries (meaning the United States and France) seem anxious to advance." Mr. Cushing, the American Minister sent out to China, had just reached New York, from Vera Cruz, by the ship Eugenia, bringing dates 23 days later from Canton, and 10 later from Mexico. Events were reported by this gentleman to be fast thickening upon Santa Anna, who was expected to be speedily executed as a rebel-chief, or driven out of the country. The election of Mr. Polk, as President of the United States, and the agitation of the Texan annexation business at Washington, had created no particular sensation in the republic. It was the opinion of Mr. Cushing, that "the star of Santa Anna had set for ever; and such a state of things must, it is argued, aid the purposes of the United States in completing the object they have now at heart regarding Texas." The departments of Sonora, Jalisco, Zacatecas, Aquas Calientes, and one or two others, were, it is expected, in a state of revolution, and in the military possession of Paredes. Santa Anna, with Corlabar, had occupation of Queretaro and Guanajuato. Canalizo, Santa Anna's president *ad interim*, and his Ministers, were prisoners at Mexico. Congress, after its forcible dissolution, had reassembled, and a temporary Administration was installed, with Herrera as president. Mexico, Puebla, and Vera Cruz, had declared themselves in favour of the provisional Government, and the support of other departments was relied on. Mr. Cushing was attacked and robbed at El Pinal, near Puebla, many valuable private papers being, among other things, taken from him. From China he brought the original of the new treaty, with a vast amount of information relative to the future diplomatic relations between the United States and China.—The Canadian Parliament adjourned, on the 20th ult., for a period of 17 days. Previously, however, Mr. Baldwin had suffered a defeat upon the question whether the subject has the right of petitioning for a redress of grievances without the intervention of the Ministers. The question was put to the vote, and resulted in the reception of the petitions which gave rise to the debate, by 51 to 22. The royal assent had been signified to the Dependence of Parliament Bill, Her Majesty intimating her regret that such a measure was deemed advisable by the local Legislature. The royal assent was withheld from the Secret Societies Suppression Bill, on the ground of its being arbitrary and unconstitutional; and a hope is expressed that secret associations would be voluntarily terminated, under the influence and exhortations of the Executive.

SCOTCH SEQUESTRATIONS.—D. M'DOUGAL, Greenock, coal merchant.

Metropolis and its Vicinity.

The Offertory in Marylebone.—On Saturday a numerous meeting of the vestry of St. Marylebone took place at the Court House, specially convened for the purpose of investigating certain charges of misappropriation of a portion of the proceeds of a charity sermon, against the rector of Trinity Church, the Rev. Dr. Penfold, and also to consider a resolution, of which notice had been given, upon the subject. The Rev. Dr. Spry, the rector of the parish, presided, and so great was the interest in the proceedings, that not only was the vestry completely filled by the members, but the gallery appropriated to the rate-payers was also numerously attended. Mr. Joseph said that, having given notice of a motion on this subject, which was now agitating the parish from one end to the other, the duty devolved upon him to bring the matter before the vestry. It appeared that on the 14th July last a charity sermon was preached by the Rev. Dr. Cuthbert at Trinity Church, in aid of the female charity schools of the parish. Amongst the collection made on that occasion was found two ten pound and a five pound note, inclosed in a piece of paper, on the outside of which was written the word "tithes." In consequence of this the Rev. Dr. Penfold had taken the 25*l.* in question out of the plate, and appropriated it, on his own judgment, to some other purpose than that of assisting the charity for which the collection was made, and this had been done with the consent of the rector's churchwarden, who had refused to give any explanation on the question. The result was that the Bishop of London had been appealed to, but his lordship, believing that the amount referred to had been appropriated to the use of the rector by the consent of the churchwardens, had refused to interfere. The vestry churchwarden however on being applied to, declared that he had not only been kept in the dark in the matter, but entirely disapproved of the manner in which the rector had appropriated the money. It was therefore contended that the Bishop of London had been misinformed as to the money being appropriated with the consent of the churchwardens, and Mr. Joseph moved a resolution concurring with the opinion of the vestry churchwarden, directing that such be entered on the minutes, and a copy transmitted to the bishop of the diocese, and to the Rev. Dr. Penfold, rector of Trinity. The meeting was addressed by Sir P. Laurie, Mr. G. Daniell, Mr. Elliott a deputy Lieutenant of the county, and other gentlemen, all of whom condemned the conduct of Dr. Penfold. The Rev. Dr. Spry, the rector of the parish, concurred with the preceding speakers, that when a collection was made for a charity, the money placed in the plates belonged to that charity, and could not be applied by the clergyman to any other purposes. The Rev. Chairman proceeded to put the resolution, and although nearly eighty vestrymen were present, it was carried without a single dissentient, amidst general marks of approbation.

Intended Dissolution of the Kensington Union.—On Monday a meeting of the parishioners of Hammersmith was held in consequence of the Poor-law Commissioners having announced their intention to dissolve the Kensington Union. Many speeches were made expressing satisfaction at the result, and resolutions were agreed to, thanking the guardians of Hammersmith for their endeavours to obtain the dissolution of the Kensington Union, and requesting them to urge on the Poor-law Commissioners the necessity of a complete dissolution of the Union by the separation also of Hammersmith from Fulham. Another resolution was also passed unanimously, appointing a deputation to wait on the Poor-law Commissioners for the purpose of urging them to complete the dissolution of the Kensington Union before the commencement of the next parochial year.

Mr. Consul Pritchard.—It is announced that Mr. Pritchard is about to sail next week for the important station to which he had been appointed by Government prior to his forcible removal from Tahiti, namely, the extensive and populous group of the Samoas or Navigator's Islands. This group, which comprises the islands of Upolu, Savaii, Tutuila, Manono, &c., is situated considerably to the west of the Tahitian and Society Islands, and east of the Feejee Islands. It is one of the most populous and important groups of the Polynesian archipelago. The population is about 60,000, whilst that of Tahiti and the Society Islands is only 20,000, of the Marquesas 15,000, and of the Hervey Islands 18,000.

Important Improvements in the Tower.—On the site of the grand storehouse or small armoury of the Tower, destroyed by the late fire, spacious barracks are to be erected. The ground has already been excavated, and the foundation commenced; the works will, therefore, proceed without delay. It has been decided that the architecture shall be in strict keeping with that of the White Tower, surrounded with turrets and battlements of the same order. The length of the building will be upwards of 300 feet, and will be capable of accomodating 800 troops. The present quarters of the soldiers, called the Irish barracks, will be converted into ordnance stores on the completion of the new building. The moat is to be converted into gardens and promenades, and will be set apart for the troops. A new entrance to the Tower, approached by a draw-bridge, with guard-house, warders' hall, ticket office, and other edifices, are to be erected at that part of the western extremity of the fortress at present occupied by the Spur Barrack, in a line with Lower Thames-street. The old Spur gate and tower above, at the west side of the old moat bridge, will remain. The two arched gateways, with the barracks above (modern erections), are to be removed, as will ten or twelve houses immediately opposite the Irish barracks, thus making a wide street, all being open to the rampart wall. Further up the Mint, to the northward of the Irish barracks, other buildings, consisting for the most part of huge and unsightly red-brick houses, will be demolished. Other improvements of a similar character will be made, and thus a fine open thoroughfare will be made. A large building in the Mint, nearly underneath St. Peter's Church, is to be converted into an infirmary for the troops. One of the most important improvements to be effected will be the formation of a new parade. To the height of the present parade the road will be filled up, and approached by a fine flight of steps. Houses contiguous to the parade will be rased, and on their site will be erected a verandah, under which the soldiers may be drilled in inclement weather. The present refreshment room, in the rear of the houses alluded to, will be re-modelled and converted into a guard-room, while that which now adjoins the White Tower will thus stand entirely alone. The map offices on the terrace are to be the officers' quarters and mess-room. Most of the buildings will be newly roofed, to harmonise with the architecture of the White Tower. Perhaps not the least advantage connected with the contemplated improvements is, that in future the most interesting portions of the Tower, which have hitherto been closed, will be thrown open to public inspection. Amongst these the first that demands attention is "the Bell Tower," situate immediately behind the Lieutenant's house. It takes its name from the circumstance that it is surmounted by a small wooden turret, containing the alarm of the garrison. It was formerly a prison, and derives some celebrity from having been the place of confinement of Fisher, Bishop of Rochester. It is also said to have been the place in which the Princess, afterwards Queen Elizabeth, was lodged when imprisoned in the Tower by Queen Mary. The next place to which the public will be admitted, proceeding northward from the Bell Tower, is the Beauchamp or Cobham Tower, and it will be approached by a battlement. It is called the Beauchamp Tower on account of being the place of confinement of Thomas Beauchamp, Earl of Warwick, who was imprisoned in the Tower previous to his banishment, in 1397. It is also called Cobham Tower, on account of some of the Cobham family having been confined there for having been implicated in the well-known Wyat conspiracy. This Tower, from its having been one of the principal state prisons, and the place where many illustrious persons were confined, excites a degree of interest, which is heightened by the numerous inscriptions, coats of arms, and other devices, left on its dreary walls by the unhappy sufferers. The present mess-room, a spacious apartment on the first floor, was formerly a prison. Engraved on the walls are the names of the famous Mortimer, Neville, the Peverills, Tyrrells, Philip Earl of Arundel, Dudley Earl of Warwick, and others. Immediately above is another prison, in which Anne Boleyn and others were confined. These and many other places, including the White Tower, will all be thrown open gratuitously to the public. During the last few days several coins of the reigns of Elizabeth, Edward VI., and Charles I., have been found by the excavators, and carefully preserved.

Anti-Corn Law League.—The first meeting of the League for the year took place on Wednesday evening in Covent Garden Theatre. Mr. Wilson took the chair, and the meeting was addressed by Mr. M. Gibson, Mr. Cobden, and Mr. Fox, who stated that "the policy of the League during the present year would be to enlarge the county constituency by the purchase of 40-shilling freeholds, so as to meet the landlords on their own ground."

Attempted Murder and Suicide.—On Wednesday, a man named John Clements, a woolstapler, from Stockbridge, living in the Grange-road, Bermondsey, attempted to murder his wife by cutting her throat, and afterwards committed suicide. The man had been for some time in arrears of rent, and the fear of being apprehended had affected his mind. The wife was severely wounded, but not fatally, and it is expected she will recover: but the man himself died before assistance could be procured.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Jan. 11: West Districts, 191; Northern, 219; Central, 208; Eastern, 210; Southern, 287; Total, 1109; males, 555; females, 554. Weekly average for the last five years, 963. Births in the week, 1311; males, 711; females, 600.

Provincial.

Banbury.—A meeting of agriculturists resident in this neighbourhood was held last week, to consider the propriety of petitioning Parliament for the repeal of the Malt-tax. It was stated that the committee of the Agricultural Protection Society in London had deemed it inexpedient to commence an agitation for a repeal of the Malt-tax, as it involved an aggressive policy not contemplated at the formation of the Society, and as there appeared to be a difference of opinion with respect to the alternative which must be resorted to in order to supply the deficiency in the exchequer which would be occasioned by the withdrawal of so large a portion of the national income. Several gentlemen [illegible]

meeting at considerable length, and resolutions affirming the necessity for repealing the Malt-tax were agreed to almost unanimously. Petitions to the Legislature founded on these resolutions were prepared and numerously signed.

Bridgewater.—The neighbourhood of the quiet village of Shapwick, near this town, has been thrown into a state of the utmost consternation by the apprehension of a woman on the charge of having murdered by poison several of her nearest relatives, including her children, husband, mother, and brother. Her name is Sarah Freeman, the widow of Henry Freeman, the son of a decent man, who for many years carried on the business of a glazier and plasterer in this town. The culprit was a loose character before her marriage, and had some illegitimate children, all of whom, it is said, died in a sudden and mysterious way. The facts were brought to light by the death of her brother, Charles Dimond, a few days since, under circumstances which led to inquiry. It appears that the brother was last week taken suddenly ill with vomiting and other symptoms attendant upon the administration of poison, from which attack he died; after which his sister, the accused, having taken the furniture, removed suddenly to Bridgewater. The suspicious circumstances attendant upon his death led the surgeon of the neighbourhood to infer that it was probable that deceased had been poisoned. The magistrates were made acquainted with the matter, and the stomach and intestines of the deceased, together with their contents, taken from the body and transmitted to Mr. Herepath, the analytical chemist, for his inspection, by whom a considerable quantity of arsenic was found and reproduced as metallic arsenic. The woman was apprehended, and, upon the matter becoming known, it was recollected by the inhabitants that within a very short period several members of the accused's family, viz., an illegitimate child, her husband, her mother, and three or four other persons with whom she was connected, had all died suddenly, and had been affected with symptoms of a similar character. The county Coroner being informed of these circumstances, ordered an inquest, which met on Thursday, and the necessary steps having been taken for the exhumation of some other of the bodies, the inquest was adjourned. On Wednesday the prisoner was again brought before the magistrates, and after several witnesses had been examined relative to the death of her brother, including the surgeons who had made the *post mortem* examination, the Court informed the prisoner that now was the time for her to make any statement. The prisoner, in a firm voice, said—"I am not guilty; my brother ought to be committed to prison as well as me." The prisoner was then committed to Taunton Gaol for the murder of her brother, Charles Dimond. The prisoner was then charged with the murder of her mother, Mary Dimond, and the same evidence was gone into as at the Coroner's inquest.

Exeter.—The Bishop of Exeter has withdrawn from the contest on the subject of the Rubric, in consequence of a letter from the Archbishop of Canterbury, calling upon him to wait until some general measure be devised which shall be sanctioned by the whole Church. This event was announced to the clergy of the diocese, in the following letter:—

"Bishopstowe, Jan. 8, 1845.—Rev. and Dear Brethren,—I have this day had the gratification of receiving from his Grace the Archbishop a copy of his 'Letter to the clergy and laity of the province of Canterbury.' That letter leaves me under no difficulty how to act. Not only in deference to his Grace's authority, but in most willing concurrence with the sentiments which he has expressed, I thankfully accept the prospect of an adjustment of our present diversities by some general measure which shall have the sanction of the whole Church. In truth, I feel that I could not more effectually labour for the great object which I have had at heart—the restoration of certainty and vigour to the law of the Church in all that relates to our public worship—than by now relinquishing my own separate endeavours, and merging them in that common effort which his Grace has announced his intention to promote, when 'the way shall be prepared for a final settlement.' Meanwhile, I advise you all to act in conformity with the views so plainly set forth by the Archbishop; that is, to continue the services in your several churches as they now are, making no attempt to approach nearer to an exact observance of the rubric, unless you shall, in any instance, ascertain that the wish of your people is clearly in favour of such an advance. One reservation I must, indeed, make, though I hope it is unnecessary. If the practice in any parish at present prevail (I know not that it does), of omitting or garbling portions of the offices of the Church—especially the offices of baptism and burial—by reason of objection to the doctrines therein involved, or of introducing prayers of private composition, either before the sermon or elsewhere, such violation of the Church's law must not lay claim to indulgence. And now, in addressing you on this occasion, most probably for the last time, let me express my deep sense of the value of that support which I have received from the great body of my clergy, and of the warm and affectionate sympathy evinced by very many of you, under circumstances of no common trial. These are matters of grateful and enduring remembrance. If there have been some instances of an opposite feeling (as I am bound in sincerity to add that there have been some, however few), I assure those who have exhibited it, that they will not, in our future intercourse, experience any unpleasing recollections of it on my part; and if, on reflection, they shall as readily forgive themselves as I forgive them, I wish that they may have formed a right estimate of what their duty has required, and may hereafter require them to do. This last is a subject on which I would not dwell. But I am desirous of saying, with reference to some individuals of high station, on whose public conduct I deemed it necessary publicly to remark, that I rejoice to believe that there was much of misapprehension of motives—something, it may be, of mistake of facts. In respect to one eminent person in particular, I cannot doubt the statement made by him of his own conduct; it is plain, therefore, that the terms in which he had claimed a right to act and speak, in resistance to the lawful order of his Bishop, were not intended by him to imply (for he has since expressly denied) that he had exercised that right, as his words themselves induced me to conclude. Of all the harassing and painful incidents of the last few weeks these personal conflicts have been by far the most harassing and painful. May they [illegible] be as if they had never been! But, whatever [illegible] regret that I deemed it necessary publicly to assert those principles of Church authority which it is alike the duty of us all to recognise and to inculcate. The very vehemence with which the assertion of them has been resisted proves, if proof were necessary, the necessity of their being asserted, and of our never suffering them to fall into oblivion. In conclusion, I congratulate you on the prospect of those principles being, ere long, practically asserted and enforced by our rev. primate; and thus of his effecting, if it be God's good pleasure, a final and peaceful settlement of questions which (inconsiderable as, for the most part, are the subjects of them) must be settled, if the Church of England is to continue to us anything better than an empty name. I am, rev. and dear brethren, your affectionate friend and brother, H. EXETER."

This letter has excited much conversation and comment, the general opinion appearing to be, that it forbids any "attempt to approach nearer to an exact observance of the rubric," *unless the clergy shall ascertain that the wish of their congregations "is clearly in favour of such an advance,"* which it is concluded from this paragraph the Bishop countenances and encourages. Acting apparently upon this impression, some of the younger clergy of the diocese, who had adopted the obnoxious forms, have refused to abandon them at the demand of the parishioners. The two churches of St. Sidwell's and St. James's, Exeter, had been held up as pattern churches for the full observance of the Rubric; but in consequence of the strong feeling of hostility on the part of the laity, the Rev. Mr. Carlyon of St. James's, on Saturday last expressed his readiness to yield to the wishes of the parishioners. The Rev. Mr. Courtenay, however, curate of St. Sidwell's, has determined to resist his congregation, and a violent contest has been going on in the parish for some days, which has already been attended with very unhappy results. It appears that the inhabitants last week addressed a requisition to their churchwardens for a meeting to express their opinion on the Puseyite practices of their ministers. This requisition with the accompanying notice from the warden, was fixed upon the gate-post of the churchyard, adjoining the principal street. The Rev. F. Courtenay, who is a nephew of the Earl of Devon, on entering the church for prayers, tore down the requisition and trampled it under his feet. This outrage was the subject of strong remarks at a meeting of the parishioners held on the same day, which, however, confined its resolutions to a respectful request that the obnoxious practices might be discontinued, and adjourned for a week to receive the answer. The reply of Mr. Courtenay to the adjourned meeting of Saturday last began with an insinuation that the parties who composed the meeting were not "constant attendants at church," or at all "interested in the matter." He refused to withdraw the surplice and the other objectionable forms, alleging that because he had long used them the Bishop's second pastoral did not command him to discontinue them. He gave other reasons, saying that if he yielded he should feel unworthy of his office, and that he considered their request "most unbecoming," and in a postscript appealed to the letter of the Bishop as strengthening his arguments. The meeting, which contained about 150 persons, and was held in the church, received this letter with much dissatisfaction, and it was determined by the congregation to build a free church, the first stone of which, it is said, is to be laid in the Barnfield in three weeks. Nor has the matter rested here. When Mr. Courtenay, on Sunday last, ascended the pulpit two-thirds of his congregation at once rose and left their seats, and in the evening, upon his return from church, he was followed by a large concourse of people, and hooted and hissed through the public streets as he passed to his own residence. In other parts of the diocese the excitement is still as great as ever. At an adjourned meeting of the rural deanery of Plympton, last week, resolutions deprecating change in the Church Service, and advising delay till the question is settled by authority, were adopted by 15 to 12, after a very angry discussion; but the minority, consisting almost entirely of young clergymen, embodied an amendment which they proposed in the form of a protest, which they transmitted to the Bishop. The amendment was to the effect "that the thanks of the clergy of the deanery be presented to the Bishop of Exeter for his pastoral letter, with the expression of the determination of the clergy to render implicit obedience to his lordship's commands, and further expressing the dissatisfaction of the clergy at the course taken by the laity during the recent agitation." The clergy of the deanery of Hartland, including Bideford and other important places in the North of Devon, have agreed to an address to the bishop, expressing their confidence that his lordship will not be deterred by any "unconstitutional resistance," and declaring that, while they disavow any leaning to the practices of the Church of Rome, they will disregard all "unauthorised interference," and follow his lordship's admonitions. The laity of Slapton, Alphington, and other places, on the other hand, have adopted very stringent resolutions in opposition to these views. One of the resolutions adopted at the latter place declares "That this meeting wholly repudiates the doctrine of 'passive obedience' and non-resistance laid down and inculcated by the Bishop of Exeter's letter to the parishes of St. Sidwell and St. James, and cannot conceal from itself that the sacred name of religion is being used by this prelate for the undue exaltation of the priests and the subjugation of the laity." This feeling appears to be entertained in many places throughout the diocese, and among others in that district of Cornwall of which Helston, the scene of the late affair of Mr. Blunt, is the principal town. It appears that the churchwardens of the several parishes of the deanery of Kirrier, at a meeting held at Helston on the 23d of last month, amongst others adopted the following resolution:—"That, in the opinion of this meeting, the necessity for episcopal interference in the present case (if such there be) has been created by the bishop of the diocese himself, who has privately encouraged several of his clergy holding Tractarian doctrines to introduce obsolete and long-forgotten observances, with the intention of furnishing himself with an excuse for interposing his authority. And this meeting is moreover of opinion that the bishop was well aware that such innovations were not acceptable either to the clergy or the laity, and that therefore he shrank from introducing them on his own responsibility until he could furnish himself with a pretext for interfering in the character of a mediator."

Haswell.—It may be remembered that, at the time of the explosion in the Haswell colliery, in September last, when numbers of lives were sacrificed, Mr. Faraday, the chemist, and Mr. Lyell, the geologist, were commissioned by Government to attend the inquest, and to examine the mines, with a view to the prevention of such disasters in future. The report of these gentlemen, which has been recently presented to Sir J. Graham, is an exposition of the causes of such explosions, and makes some important suggestions for the more perfect ventilation of dangerous mines. The depth of the principal shaft of the Haswell coal mine is 925 feet, where there is a seam of excellent coal, 5 feet 5 inches thick. To arrive at that bed, the shaft was sunk through several workable beds of coal, of inferior thickness, which it is intended to work when the more valuable seam is exhausted. This plan of working the lower bed first is considered to be one cause of the great quantity of carburetted hydrogen gas collected in the mine, for as the roof of the exhausted part of the mine falls in, the upper seams of coal become disturbed and broken, and thereby cause the generation of a larger quantity of gas, which is forced by its elastic pressure into the mine below. In working the coal it is customary to leave large masses to support the roof. These "pillars" are allowed to remain till the coal in that portion of the works is obtained, and then they are removed, the roof being supported by props called "juds." Finally these juds are taken away, and then the roof falls in, leaving a large cavity above. The mass of loose stone and coal that falls from the roof is termed by the miners "goaf," and it is from these goafs, or rather from the cavities above them, that the greater quantity of gas enters the workings and renders them dangerous. As the carburetted hydrogen is considerably lighter than common air, it collects on the top of the mine, and especially in the cavities formed by the falling of the roof, and by the ordinary modes of ventilation these cavernous receptacles of gas cannot be affected. If, however, the gas remained in those goaf caverns, or exuded into the passages of the mine in regular quantities, the danger might be removed by the ventilating currents of air passing through the mine; but the quantity of gas varies with every change of the atmosphere, independently of other circumstances. For instance, when the pressure of the atmosphere is diminished, as indicated by the fall of the mercury in the barometer, the gas expands and is forced from the caverns into the mine by its own elasticity. At such times the ordinary ventilation is insufficient to prevent the air from becoming impregnated with the gas to the explosive point; and any indiscretion on the part of the miners, by exposing the naked flame of a candle in such an atmosphere, produces an explosion. The remedy recommended by Messrs. Faraday and Lyell is to provide especially for the ventilation of the goaf caverns. They suggest that a large iron pipe, about 12 inches in diameter, might be placed along the roof of the mine, extending from the downcast shaft (down which the air descends to ventilate the mine) to the upcast shaft, from which a moveable branch pipe might ascend to the top of the goaf vault. The draught of air through the pipe, produced by the ventilating fires, would, it is supposed, be in general sufficient to draw the gas into it from the caverns, and it would be expelled by the upcast shaft; but if that did not prove effective, the current of air in the pipe might be increased, by employing a revolving fanner, or by any other convenient means. On examining the mine at Haswell, and inquiring into the extent of the influence of what the miners call the "choke damp," or "after damp," it occurred to Messrs. Faraday and Lyell that the quantity of gas exploded was insufficient to produce, by its ignition, the large volume of carbonic gas which constitutes the "choke damp" that it appeared must have been generated by the explosion. They inferred, therefore, that the coal-dust in a mine must be ignited as it is driven along by the force of the explosion, and that the carbonic acid gas must, for the most part, result from the combustion of those small particles of coal. This supposition was confirmed by examining the Haswell colliery; for quantities of particles of charred coal or coke were found on the pillars and passages of the mine near the point of explosion. In most accidents in coal-mines, from the ignition of carburetted hydrogen, the "after damp" produces far more fatal effects than the mere force of the explosion. In concluding their report, which is likely to lead to important practical consequences, Messrs. Faraday and Lyell notice the fact that a majority of the miners who were examined at the inquest were unable to sign their names, though many of them were very intelligent; and the great advantages of teaching such men, at least the first principles of geological and chemical science, are strongly enforced.

Ipswich.—Mary Sheming, who was condemned at the late assizes at Bury St. Edmund's, for the murder of her grandchild, at Martlesham, near Woodbridge, expiated her offence on the drop in front of the County Gaol, on Saturday, in the presence of about 10,000 persons. From the time of her condemnation up to the period of

her execution, she maintained her innocence of the crime, and endeavoured to fix it alternately upon two of her daughters; one of whom is now confined in the gaol under a conviction for larceny, and whose imprisonment expires in the course of a few days. She could not be induced to make any confession, although there was no doubt of her guilt; and she met her fate with a hardihood which astounded the spectators.

Norwich.—A special meeting of the Committee of the West Norfolk Agricultural Society was held last week, at which the members were unanimous in opinion as to the benefits to be derived from the repeal of the Malt-tax, and a petition to Parliament was agreed to without opposition. It was stated that the farmers of Norfolk are in favour of a total repeal of the duty, and that they consider any partial reduction would afford comparatively little relief, as the farmer would still be subject to the cost of collection, as well as to the annoyance of perpetual supervision. It was agreed that copies of the petitions should be sent to the various market towns throughout the county, where they will lie for signature till the opening of Parliament.

Petworth.—At the West Sussex Quarter Sessions, held at Petworth on Friday last, two men named Coles and Read, regular tramps, were convicted of stealing a copper from some premises at Itchingfield; and Peter Kennett was convicted of receiving the same, well knowing it to have been stolen. The trial occupied the court for several hours. The evidence established the guilt of all the prisoners, and tended to show that a number of robberies of a similar description had been committed in different parts of the county. The prisoner Kennett was a general shopkeeper, doing a very extensive business at Billinghurst, and was possessed of considerable wealth. One of the witnesses described him as being "the keeper of the post-office, the collector of taxes, treasurer of the turnpike trusts, agent to a fire-office, and holding other offices of trust." His reputation for honesty and charitable deeds was spoken to by a host of respectable witnesses, who appeared in court to give him a character, but he was clearly proved to be a receiver of stolen goods on a large scale, buying whatever was brought to him by the depredators with which that part of the country abounds. Kennett was sentenced to 14 years' transportation, and Read to 12 years. Coles had pleaded guilty, and as his communications had materially aided the police in tracing the stolen articles to the possession of Kennett, he was sentenced only to six months' imprisonment.

Slough.—On Tuesday, the mother of Sarah Hart, the unfortunate woman supposed to have been murdered at Salt Hill, arrived at Eton with her husband, when a meeting of the county magistrates took place, with a view to the further investigation of the case. The mother was then taken to Farnham churchyard, where the body of the deceased woman was exhumed and identified by the mother. The superintendent of police also produced before the magistrates a quantity of drugs found at the prisoner's house at Berkhampstead. There were upwards of fifty phials, containing various liquids, which underwent an inspection by the surgeons, Mr. Norblad and Mr. Champneys, none of which, it is said, contained prussic acid. In obtaining the drugs the officer received every assistance and courtesy from the wife of the prisoner, who is described as a very accomplished woman, and her daughter, a young lady of 17, assisted in packing up the drugs in a hamper. The assistant to Mr. Hughes, chemist, 89, Bishopsgate-street, went down to Aylesbury gaol on Tuesday, for the purpose of seeing the prisoner, and he states that he remembers having sold to the prisoner on the day on which the murder was committed a quantity of prussic acid. It appears from accounts published by the local papers, that Mr. Tawell is very partial to the study of natural history, and at his house in Berkhampstead there are many rare and valuable specimens. His furniture is said to combine in a remarkable degree elegance and simplicity. He kept up to the last six servants; and so late as four days before the melancholy affair at Salt Hill took place, he was driving through London in a handsome cabriolet, drawn by two horses, when he invited some of his friends to spend a few days with him at his residence in the country. Though he had never been received a second time into communion with the Friends, he was respected by many of their number. He had the reputation of being, not only an intelligent and scientific, but a very philanthropic man, and it is certain that he expended large sums in charitable and benevolent objects.

Stafford.—This county has become the scene of another shocking murder, and there is too much reason to fear that the crime was perpetrated by a brother. The murder was committed on the night of Friday week, at a place called Biddulph, in the Moorlands, about six miles from Tunstall, and three or four from Congleton. The condition of the parties was that of small farmers. Thomas Brough, the deceased, lived at the New Brent Farm, in the parish of Biddulph. It would appear that by parsimonious habits, he had succeeded in accumulating some little property, and was the owner of Whitefield Farm, situate near his own house. This farm had been in the occupation of his widowed mother and his brother John Brough for a little more than twelve months. The mother was the recognised tenant, though it would seem that the brother John managed the farm, and was applied to for the rent when due. On the 31 inst., about dusk, a distress was put in by the direction of deceased, at this farm, for rent due to him, amounting to 29*l.* 12*s.* In consequence of some conversation which one of the bailiffs had with the mother and John Brough, the bailiff sent for deceased, in order to an amicable settlement. The deceased shortly afterwards came to Whitefield, and had some conversation with his mother and brother as to the rent due. There does not appear to have been any quarrel between the brothers in the house, but deceased complained very much about his rent not being paid, and intimated that he must have it. He also refused to return two boxes, which had been moved by the bailiffs to his house, until the following morning. The bailiffs left the house, and the brothers remained in conversation. Shortly afterwards deceased went into the fold, where some further conversation ensued. He was about to leave, when his brother John offered to accompany him with a lanthorn. Deceased was never afterwards seen alive, but the next morning his body was found in a sand-pit, on Biddulph Moor, quite dead, the skull having been fractured by a hammer, which was found covered with blood on the brother's farm, who was at once taken into custody. From the evidence of a third brother, it appears that the prisoner confessed to him that he had committed the murder, and the jury at the inquest having returned a verdict of Wilful Murder against him, the prisoner was committed to take his trial at the next assizes.

Railways.

The following are the returns for the past week:—Birmingham and Gloucester, 2245*l.*; Bristol and Gloucester, 1015*l.*; Eastern Counties, 3798*l.*; Edinburgh and Glasgow, 2487*l.*; Great Western, 13,183*l.*; Grand Junction, 7560*l.*; Glasgow, Paisley, and Ayr, 1380*l.*; Great North of England, 1404*l.*; London and Birmingham, 14,368*l.*; South Western, 5188*l.*; Blackwall, 644*l.*; Brighton, 2893*l.*; Croydon, 390*l.*; Liverpool and Manchester, 4608*l.*; Manchester, Leeds, and Hull, 5808*l.*; Midland 8477*l.*; Manchester and Birmingham, 3309*l.*; Newcastle and Carlisle, 1339*l.*; Newcastle and Darlington, 950*l.*; South-Eastern and Dover, 4858*l.*; Sheffield and Manchester, 936*l.*; Yarmouth and Norwich, 189*l.*; Preston and Wyre, 300*l.*—The Board of Trade have given notice in the *Gazette* of Tuesday that they have had under consideration the following schemes for extending railway communication to Portsmouth, viz.: The Brighton and Chichester—Portsmouth Extension; the Direct London and Portsmouth; the Guilford, Chichester, Portsmouth, and Fareham Branch; the London and Portsmouth, with Branches to Shoreham-bridge, Fareham, and Reigate; that they have decided on reporting to Parliament in favour of the Guildford, Chichester, Portsmouth, and Fareham Branch; and against the Brighton and Chichester—Portsmouth Extension; Direct London and Portsmouth; London and Portsmouth, with Branches to Shoreham-bridge, Fareham, and Reigate. And the Board having further had under consideration the following schemes for extending railway communication in the metropolitan district, viz.:—The Epsom and Dorking; the Grosvenor Railway; the Great Western, Uxbridge, and Staines Junction; the London and Brighton—Wandsworth Branch; the London and Croydon—Dorking Branch; London and Brighton — Dorking Branch; the London and South-Western — Epsom Branch; the Metropolitan and Central Junction; the Metropolitan Extension of the London and South-Western; the Richmond and West-End Junction; the South London and Windsor; the South-Eastern Branch to Reigate and Dorking; the Staines and Richmond; have decided on reporting to Parliament in favour of the Metropolitan Extension of the London and South Western; Richmond and West End Junction; Staines and Richmond; against the Grosvenor Railway, Great Western, Uxbridge, and Staines Junction, London and Brighton—Wandsworth Branch, London and South-Western—Epsom Branch, Metropolitan Central Junction, South London and Windsor; and recommending the postponement until a future period of the Epsom and Dorking; London and Croydon—Dorking Branch; London and Brighton—Dorking Branch; South-Eastern Branch—Reigate to Dorking.—A special meeting of the Town Council of Newcastle-on-Tyne was held last week, for the purpose of receiving the report of a committee on certain railways proposed to pass through Newcastle. The report entered very fully into the merits of the respective projects. It stated that the line proposed by Mr. Stephenson is called the Newcastle and Berwick Railway, and is intended to cross the Tyne by a bridge at an elevation of more than 100 feet above high-water mark, and about ninety yards west of the present bridge. One of the leading features of this line is, that it unites all the railway stations in one place near Melville-street, from whence the traveller may proceed by railway north, south, east, and west. The other line is projected by Mr. Brunel. It crosses the river by a bridge 93 feet in height, proceeds across the Forth to Thornton-street, and thence by a tunnel 2410 yards in length to the town-moor, terminating in Jesmond-fields, from whence it takes its departure northward. The committee recommended Mr. Stephenson's line, as most desirable for the interests of the town; they suggested, however, that a clause be inserted in the Act of Parliament requiring the company to commence with the bridge, simultaneously with the other works upon the line, and proceed with all reasonable despatch in its completion. A long discussion followed the reading of the report, which was at length confirmed by a large majority, so that the corporation of Newcastle have now pledged themselves to support Messrs. Stephenson's and Hudson's line from Newcastle to Berwick-upon-Tweed, in opposition to the atmospheric line proposed by Lord Howick.—A meeting of a committee on the merits of the railway proposed to connect Yarmouth with the Metropolis. The report recommended the public to concur and forward, by every means in their power, the line (known as Eagle's Line) from Thetford through Bury, to a junction with the Northern and Eastern at Elsingham Mills, and thence by Bishop's Stortford to London, as involving the shortest distance from Yarmouth to London, and opening a communication with an extensive and populous part of the country, hitherto having but little commercial dealings through Yarmouth. The committee also recommended the public not to assent or dissent to either of the lines to Diss—Capt. Moorsom's line through Beccles and Diss, and Mr. Stephenson's line by Reedham, Beecles, Bungay, and Weybread Mills to Diss, until the respective bills for those lines are printed. After a long discussion the Recorder moved the adoption of the report, upon which the following amendment was moved and adopted unanimously:—"That this meeting receives and adopts the report of the committee, so far as it is applicable to the Bury and Thetford line; but inasmuch as it takes but little notice of either of the projects which have been before them connecting this town with Diss, and considering that the trade and commerce of this town and port would be further extended and improved by a railway communication to Beccles, Bungay, and Diss, this meeting expresses its approval and support of a Diss, Beccles, and Yarmouth line and railway through that part of the country.—At a meeting of the inhabitants of Bawtry, held last week, it was resolved that the Rotherham, Bawtry, and Gainsborough Junction was the best for the town of Bawtry; and Mr. Pemberton Milnes, the lord of the manor, and the owner of nearly the whole of the land in the township, and his tenantry, have given their assent to that line. Similar resolutions have been passed at meetings held at Gringley-on-the-Hill and at Worksop.—At a special meeting of the West London Company on Monday, the Directors were empowered to ratify the agreement with the Birmingham Company, by which the latter are to take a lease of the line for 999 years, at a rent equal to one-fourth of the gross proceeds, paying 60,000*l.* in liquidation of the liabilities of the Great Western. It was stated that the line had been working lately at a loss of 50*l.* per week.

Ireland.

Dublin.—The intelligence from Ireland this week is of considerable importance. In the first place we have a long and elaborate address from nine of the fourteen bishops of the Established Church in Ireland, on the subject of national education. In this document, which is temperately written, the bishops express a resolute and unqualified hostility to the National Education Board, and state the reasons why they seek the co-operation of their clergy and people. The prelates who sign this paper are his Grace the Lord Primate, the Bishops of Kildare, Clogher, Kilmore, Down and Connor, Cork and Cloyne, Killaloe and Clonfert, Ossory and Ferns, Cashel and Waterford. Those whose names do not appear are the Archbishop of Dublin, the Bishop of Meath (the latest appointment of the present Government), the Bishops of Limerick, Tuam, and Derry; and of these the Bishop of Limerick is resident abroad, in consequence of ill health. The next point of interest is a long letter from Mr. O'Connell to the Roman Catholic Bishop of Meath, on the subject of the Charitable Bequests Act. A large portion of this letter is occupied with arguments in opposition to those contained in the pastoral letter of the Most Rev. Dr. Murray, one of the Roman Catholic prelates appointed Commissioners under the Act. The rest consist of Mr. O'Connell's own reasons for disapproving of the measure. Of these, seeing they extend to no less than twenty-two heads, it would be no easy task to give a condensed analysis, even if they contained any new matter on a topic which has already been so much discussed. There are, however, some points of very general interest independently of the arguments more immediately directed against the views of Archbishop Murray. At the commencement of his letter, Mr. O'Connell states that "the plan of the English Government to undermine the Catholic Church in Ireland is daily developed more and more," and he regrets as "most melancholy and highly deplorable that at such a moment, and with so powerful a conspiracy on foot against the Irish Catholic Church, there should be so animated a dissension amongst the Catholic prelates, clergy, and laity of Ireland, on the subject of the Bequests Act."

He says—"I am able to state as certain facts, that the English Government have for some time past active agents at the Court of Rome—the one a Mr. William Petre, an English Catholic, for no treachery to the Irish would be complete without the intervention of an English Catholic; the other an Austrian, nominated by the Austrian Government. The design and object are to obtain for the British minister control over the Catholic hierarchy of Ireland. The modes of obtaining that control are twofold; the first by making a State provision for the Irish Catholic clergy, the second by a concordat with the Pope, giving a power either direct and affirmative, or indirect and by negation, to the British Crown to nominate to the Catholic prelacy all over Ireland. The English Catholic agent, Mr. William Petre, has succeeded in convincing the Pope's ministers that he is authorised to pledge the British Government to give great countenance and liberal pecuniary assistance to the Catholics in the British colonies and foreign possessions. This bait has taken, and has produced a letter from the Pope to the Most Reverend Dr. Crolly unfavourable to the Repeal agitation. It is said there was some dexterity in procuring this letter. It has, however, been some time in the hands of his Grace; *but it is not a canonical document*, and at all events, as far as it may treat of matters of a temporal nature, or matters relating to the political rights and wrongs of the Irish people, it is plainly void and of no effect. But the great strength of the English Envoy consists in the support and assistance of the Austrian agent, [illegible]

tyrannical movements amongst the Italians, causes the great military force kept by Austria in Italy to be considered as essentially necessary for the preservation of peace and order from revolutionary violence. The leaden despotism of the Austrian Government over the Catholic religion and the Catholic clergy in their subject States renders that Government justly odious and detested at Rome. But its influence and power over the Roman Court are not one whit the less. Its power is feared more than it is hated, the hatred being mitigated by the supposed necessity for the use of that power; and thus the influence of the British agent, augmented by the Austrian, is almost irresistible with the politicians of the Roman Court."

Mr. O'Connell then proceeds at great length to examine the pastoral letter of Archbishop Murray, with which our readers are familiar, and states the twenty-two objections which he makes to the Act. At the conclusion of his letter he recurs to the rumoured negotiations between the British Government and the Pope. He says:

"Since I commenced this letter I find it avowed by the Whig press, that the Whigs whilst in office had an English agent residing at Rome, in order, if possible, to influence the political opinions of that Court unfavourably to the liberties of the Irish nation. It is no longer concealed that Mr. William Petre is acting in that capacity for the present Administration. I have already asserted, and I assert again, from undoubted authority, that his Grace the Most Rev. Dr. Crolly is in possession of a letter from the Propaganda relating to the Repeal agitation in Ireland. It is an awful predicament to have the Catholics of Ireland placed in. The secrecy that has been hitherto observed makes the facts at present discovered only the more formidable. How can we be secure that, under such circumstances, any majority of our prelates should enter into any arrangements with the British Government, or sanction any arrangements, uninfluenced by the judgment of the majority of the Irish prelates, and perhaps uncommunicated to the laity or the residue of the prelacy. I do not say or insinuate that any such arrangement has taken place, or is at all likely to take place; but it is unfortunate, very unfortunate, that, at such a moment as this, with a full-blown conspiracy against the independence of our Church just discovered, that this Act of Parliament Commission should be in existence, and should be accepted by any of our prelates, however venerable or venerated. For one I tremble at the possible result. Something should be done to quiet the just fears and necessary apprehensions of the ever faithful people of Ireland. It will not do to attempt to muffle those fears and apprehensions by alleging that more consolatory intelligence has been received from Rome. Until now we did not know of the conspiracy at all—the entire was concealed. How know we what it may be the interest of the English agent to conceal? I believe there is no doubt that the letter to his Grace the Archbishop of Armagh was obtained and transmitted at a period when the friends of the independence of the Irish Church at Rome were absent, either in vacation or upon business. There was a singular dexterity in obtaining and despatching that letter. There is no part of the Catholic Church in the universe more faithfully submissive in spirituals to the authority of his Holiness the Pope than the Catholic Church in Ireland. Clergy and laymen both join in this unqualified submission. As a layman I myself proclaim, and I trust practise, the most dutiful submission in spirituals, morals, discipline, and doctrine to the See of Rome. Yet I have sworn—and so have all the Irish Catholics—that the Pope has not any temporal or civil jurisdiction within this land. But we must be vigilant. We are bound to preserve the independence of our Church from all temporal power. We are bound to protect our political liberties from every infringement. It is a miserably unhappy thing that, at such a moment, the Bequests Act should appear to afford any facilities to the British Government for further ensnaring or deluding any of our prelates. We have flung off before, and we will fling off again, please God, all vetoistical arrangements. In my second letter to your Lordship I will not only discuss the state of our regular clergy, but submit some suggestions as to the propriety of a lay deputation to Rome on these most interesting subjects. There is no law to prevent or interfere with such a delegation. In fact, the law respecting communications with Rome is very imperfectly known to our public writers. The proposition which I shall most respectfully submit as a rule in future would be, the establishment, by a synod of the Catholic Church in Ireland, in the most canonical manner, of some law or regulation which would effectually prevent any minority of the Irish prelacy from involving themselves in any statutable commission, or board, without the canonical assent of the majority of the synod. Can and ought this be done? There remains, however, this most pleasing consolation. There never was a period at which the Catholic hierarchy of Ireland, without exception, was composed of prelates of more learning, purity, piety, and perfect devotion to all their spiritual duties. The majority of such prelates ought not to be superseded by the minority."

The publication of the above letter rendered it impossible that Archbishop Crolly, the Roman Catholic Primate of Ireland, could remain silent under the imputation of Mr. O'Connell. The Archbishop accordingly, on Saturday, published a letter to Mr. O'Connell, expressing his "surprise and sorrow

"That he had ventured to assert that a letter sent to him some time past from the Propaganda *was not a canonical document*. Allow me," he said, "to assure you that in the year 1839 I received from the Cardinal Prefect of the Propaganda a communication of a similar description, in which I was directed to admonish some political ecclesiastics, who had made at public meetings such violent speeches as were not congenial to the mild spirit of their sacred ministry. In obedience to the injunction of the Holy See, I endeavoured to reclaim those misguided clergymen, but as my fraternal admonitions did not produce the desired effect, his Holiness directed the Sacred Congregation to send me another letter on the same subject, in order that I should *more efficaciously* admonish such priests or prelates as I might find taking a prominent and imprudent part in political proceedings. I considered it my duty to lay this document before the assembled prelates at our last general meeting in Dublin, who not only acknowledged it to be authentic and canonical, but to be a document of such importance, that they entered it on their minutes, and unanimously resolved that they would regulate their conduct according to its injunctions, and use their influence with their clergy in their respective dioceses, to prevail on them to follow its salutary instructions."

The following is a translation of this document:—

"MOST ILLUSTRIOUS AND REVEREND SIR,—Your Grace will recollect that on the 12th March, 1839, letters were addressed to you by this Sacred Congregation, in which it was strenuously recommended to you, in the name of our Most Holy Father, Pope Gregory XVI., that if what was reported to us continued, you should suggest more sober conduct to one or two dignitaries of the Church, and to many of the inferior clergy of that kingdom, who were represented to us as addressing from themselves too much to political matters, and imprudently discussing before the people the civil affairs of the country; and that you should diligently urge them to adopt a course of conduct more in accordance with their holy office. The Sacred Congregation does not doubt that you have exerted yourself with all assiduity for that purpose, and that you have employed that caution which the importance of the subject required, and which was to be expected from your obedience to the Apostolic See. But that the desired results have not attended the care you have bestowed on it appears particularly from the public journals of those districts in which discourses are reported to have been recently held by some of the priests, and even by some of the bishops, as well at public meetings and dinners as in the churches, which, unquestionably, if the fact be so, are far from showing that they are solely intent, as they ought to be, upon the salvation of souls, the good of religion, and the honour of God, or that they estrange themselves from temporal concerns, and the contests of political parties. It must not be concealed that this is the more offensive to the Sacred Congregation and to the Most Holy Father himself, because it tends to the hurt and disgrace of the ecclesiastical body, and even causes injury to the Apostolic See as if, little solicitous to enforce the wholesome admonitions given to those clergymen, it favoured the conduct alluded to, or at least connived at it. Your Grace may, perhaps, be aware that this is not the only time ground has been afforded for such complaints, or rather accusations; but the Apostolic See is greatly grieved by the sad experience of them. For this reason the Sacred Congregation has given again to address you, at the dictation of our Most Holy Father, upon this momentous subject. You know perfectly, most excellent Prelate, the nature and character of the ecclesiastical office; and how necessary it is, and of what importance to the maintenance of religion, that those who are engaged in its holy duties—the peaceful ministers of their King, the guardians of the mysteries of God, and charged with the spiritual guidance of the faithful—should in no wise mix themselves up with secular concerns—that they should sedulously foster among the people that tranquility and peace which is the bond of Christianity—that they should inculcate obedience to the temporal authorities in all things relating to civil concerns, both by their examples and their precepts—and that proposing to themselves exemplary prudence and moderation, preaching only Christ and him crucified, they should most studiously avoid whatever may even lightly excite or agitate the flock committed to them, or seduce it from the meekness of the Gospel. Such is and ever has been the doctrine of the Catholic Church, which the Apostolic See has never ceased to deliver from the sanctity of its office, and to urge upon every occasion that arises. It will be your part, then, most excellent Sir, to walk sedulously in these footsteps; and in all charity and patience severely to admonish as many of the clergy, more especially of the rank of Bishop, whom you shall observe in any respect acting at variance with the judgment declared on so important a subject by the Sacred Congregation, and by his Holiness. Entrusting this matter to your well-approved wisdom and anxious care, I heartily proffer you my esteem, and supplicate all happiness for you from God. At Rome; from the House of the Sacred Congregation of the Propaganda, the 15th October, 1844. CARDINAL FRANZONI, Præfect.
J. BRUNELLI, Secretary."

Archbishop Crolly appends to this document a copy of the resolution of the Irish prelates by which they unanimously pledged themselves to carry its spirit into effect, and concludes by saying—

"With regard to the Concordat between the Pope and the British Government, which has so justly excited alarming apprehensions in the minds of all the clergy and laity of Ireland, I can only state, in the most solemn manner, that I know nothing of it directly or indirectly, except by public rumour; and that I shall join the prelacy of Ireland by using every influence in my power to prevent any such insidious scheme, which would be destructive of the independence and purity of our holy religion."

The weekly meeting of the Repeal Association took place on Monday, Mr. Davis, Editor of the *Nation*, in the chair. A letter was read from Mr. O'Connell, inclosing 1*l.* from another grandchild, and announcing that he should be in town on the 18th or 19th inst., to attend the next meeting.

The SECRETARY read a communication from Mr. Steele, dated Carrick-on-Shannon, announcing that having succeeded in tranquillising the county Leitrim he would now direct his efforts to the county of Tipperary. Mr. Steele concluded by saying, "I venerate his Holiness the Pope, as the spiritual head—the *Sanctissimus* Pontiff of the religion of my Catholic Christian brethren over the globe of the earth; but I say to his Holiness, in his character of a temporal prince of a state in Italy, that 'no power on earth except the Queen, the Lords, and the Commons, has a right to make laws for Ireland—*temporal* laws for the direction of Ireland, or for any portion of her people.'"—Mr. REILLY then addressed the meeting upon the recently published Papal rescript. The Ministers of England he said were sworn to hold no communication with Rome, and yet in the face of that oath negotiations had taken place. Why had this intercourse with the harlot of the seven hills taken place? Because everything which had been tried for the purpose of suppressing Repeal—projected massacres and legal quibbles—had been attended with the most signal discomfiture, and the Pontiff of Rome, as a last resource, was called in as an auxiliary of the attempt to extinguish the flame of nationality in Ireland. Upon the solicitation of the Emperor of Russia the Pope had interfered in the affairs of Poland when it was sought to crush liberty in that country, and the reward of that interference was, that the Catholic priesthood in Poland and in Russia were treated with the utmost harshness. How was the Pope induced to interfere in the temporal affairs of Ireland? Was it by fair argument? No such thing. The Ministers who could break their oaths to their Sovereign would not hesitate to tell lies to the Pope. Whether he was influenced by threats, by cajolery, or by stupefying him, the attempt was equally atrocious, and he told the world that no temporal mandate from the Pope could have any effect with the people of Ireland. The Pope, he regretted to say, was a most excellent Conservative in his own dominions—he was anything but a Liberal at home; his subjects had no temporal liberty, and therefore he was not to be followed or obeyed in temporal matters. He had the most profound veneration for the Pontiff in his spiritual capacity, as the vicar of Christ on earth; but, although he was a firm but unworthy member of the Roman Catholic Church, no Protestant in the land would stand up more determinedly against his usurpation of any temporal authority. (Loud cheers, and cries of "We won't obey it.") He repeated, that in temporal matters, and especially as regarded Repeal, he valued the opinion of his Holiness as little as he did that of Sir R. Peel.—Mr. W. S. O'BRIEN proceeded to address the meeting at great length on the subject of Repeal Reading-rooms, and moved the adoption of a set of rules for their guidance, which was carried.—Mr. M'NEVIN briefly addressed the meeting, confining his observations to the late communication from Rome to Dr. Crolly, the Catholic Primate, which he censured in the most marked and emphatic manner. He denied that the Court of Rome, or any foreign potentate, had the right to exercise any authority over the temporal affairs of the people of Ireland. It was rumoured that English gold was at work, but he was convinced that every effort would fail in stifling the demand for Repeal. Was it, he would ask, the voice of Peel, diluted through the lungs of a Petre, that was governing the councils of the Vatican?—Mr. O'NEILL DAUNT addressed the meeting at some length on the same subject. He denied the power of the Pope to interfere in the temporal affairs of the people of Ireland, and said he would treat any rescript having such a tendency as he would an emanation from the bureau of the Grand Turk. They would accept as much Roman theology as they wished to send them, but they would receive no Roman politics.—Mr. H. GRATTAN likewise addressed the meeting, and expressed his hearty concurrence in all the observations which had fallen from the speakers who preceded him, and expressed his solemn conviction that the letter from the Propaganda did not represent the opinions of his Holiness, but was extorted from him.—Mr SMITH O'BRIEN congratulated the meeting on the noble spirit displayed to day, which clearly proved that there was not in this country a divided allegiance, and he trusted that the admonition given would be effectual in the right quarter."

The rent for the week was 263*l.* 18*s.* 1*d.* — The second meeting of the Charitable Bequests Commission took place last week. There were only three commissioners absent, namely, the Primate, Lord J. G. Beresford; Dr. Denvir, Roman Catholic bishop of Down and Connor; and Sir P. Bellew, Bart. The Master of the Rolls presided at the meeting. The principal business transacted related to the clauses of the act for the regulation of bequests to the various religious denominations, and rules were adopted for the future guidance of the board on this important subject. It was arranged, with the unanimous concurrence of the members present, that all questions respecting Roman Catholic bequests should be referred to the Roman Catholic commissioners, whose certificate is to be conclusive as to the clergyman of any parish entitled to any trust or donation. The same rule has been adopted in regard to bequests to clergy of the Established Church; and in reference to bequests to the Presbyterian clergy, the certificate of the Rev. Dr. Henry is to be acted on in like manner. Another very important regulation has been adopted in reference to Roman Catholic bequests, with a view to possible objections affecting the discipline and usages of that church. It is to this effect: In all cases where reference may be made to the Roman Catholic commissioners, in order to ascertain who is the person entitled to the benefit of any donation or bequest which may be made, to or in trust for the Roman Catholic clergyman of any parish or congregation, it is to be understood that their duty is to be merely ministerial, and that it will be incumbent on them to act on the certificate of the Roman Catholic archbishop, bishop, or vicar acting for the time being, instead of the Roman Catholic archbishop or bishop of the place, as to the person entitled thereto, and to certify accordingly. The object of this regulation is to obviate any objection as to interference with the control and authority of each bishop in his own diocese.

The Provinces.—The *Limerick Chronicle* of last week contains another copious list of agrarianisms. Amongst others there is an attack on Killballyowenhouse, the family seat of "The O'Grady." The assailants fired a shot through the hall door, and left a threatening notice of murderous intent. The *Chronicle* speaks in the highest terms of "The O'Grady" as a resident proprietor and landlord who gives constant employment, and has his lands let at a moderate rent. Mr. O'Grady offers 50*l.* to discover the author of this outrage. There are several minor affairs of a like kind. —Last week the revenue police discovered, close to the spot where the unfortunate Sheppards were murdered, at Coolfin, Queen's County, a musket and carbine concealed in a ditch, both heavily loaded, and in excellent order.—On Wednesday week six men were apprehended by the Ennis constabulary, charged with conspiracy to murder the late Mr. Gloster, who, as our readers will recollect, was shot in his gig while returning from the Road Sessions at Spancilhill, between the villages of Quin and Kilkishen, in November last. Three of the men were residing on the lands of Toona; and the other three had no fixed residence—wandering about the country.

Scotland.

Glasgow.—The installation of the late Advocate-General, Andrew Rutherfurd, Esq., as Lord Rector of this University, took place on Saturday, in presence of the professors, students, and a large assemblage of ladies and gentlemen. In the absence of the Rev. Principal Macfarlan, Professor Hill opened the proceedings with prayer. The usual oaths were then administered to the Lord Rector. The speech of Mr. Rutherfurd referred to the tests in the Universities, and regretted that these were not abolished in all the Universities of Scotland, and concluded with an eloquent appeal to the students not to live in vain, but to leave some memorial of good to those who should live after them.—The Glasgow papers mention the occurrence there, on Tuesday week, of a fog, which is described to have been unequalled in density, "quite suffocating." "The fog on Friday fortnight," says the *Glasgow Constitutional*, "which was said to have eclipsed all former fogs, was nothing to it."

Law.

COURT OF EXCHEQUER.—*The Qui Tam Action.—Smith* v. *Bond.*—This was an action brought by an informer to recover penalties for keeping a gaming-house. The case was tried nearly twelve months since, and a verdict taken for the plaintiff, by which defendant was subjected to penalties to the amount of 300*l.* In the course of the suit an application was made to plaintiff's attorney, under an order of one of the Barons of the Court, to state the name and abode of plaintiff, and, in apparent compliance with this order, plaintiff's attorney delivered what turned out to be an untrue statement of his client's residence. A rule was then obtained to refer the matter to the Master, and the Master reported that the statement made by plaintiff was untrue; but there did not appear to be any collusion between plaintiff and his attorney, as the latter was misled by the statement made by the client. A rule *nisi* was then obtained for an attachment against plaintiff, upon the ground that he had been guilty of a contempt of Court, by a wilful disobedience to the Baron's order. Mr. Lush now appeared to show cause against the rule. He admitted that plaintiff did not live at the place which he had described as his residence, it was therefore impossible to contend he had truly stated his place of abode. The fact, however, turned out to be, that plaintiff had rented and paid for furnished lodgings, and though he did not live there, he thought he was justified in stating his lodgings to be his place of abode. He [illegible] that the rule

could not be made absolute on two grounds. 1. Because the Baron's order, directing plaintiff's place of abode to be given to defendant was not directed or addressed to plaintiff, but to his attorney —The attorney might have been guilty of contempt of Court therefore, but plaintiff could not. 2. The Baron's order was not made a rule of Court, and there was no instance, as he contended, where an attachment had been granted for disobedience to a Judge's order, until it was sanctioned by the Court, and made a rule thereof. The Chief Baron suggested various instances in which the Legislature had given exclusive authority to the Judges at chambers and elsewhere to make orders. If disobedience to those orders could not be punished by attachment, what other means was there of enforcing obedience to them?—Mr. Platt contended that plaintiff was guilty of a clear contempt of Court, by instructing his attorney to give a wilfully false statement, when directed by a Judge of the Court to give his true place of abode. There was abundant evidence that the lodgings referred to were taken by plaintiff to evade compliance with the Baron's order. They submitted that a fraud of this description was to be punished in the same manner as a contempt with respect to the process of the Court. If a writ was addressed to one person, and it fell into the hands of another, who destroyed it, such person was guilty of a contempt of the Court. The Judge's order in this case was similar to process, and by rendering it unavailing, the plaintiff was guilty of a contempt of Court.—The Chief Baron did not think it necessary to decide in this case, if an attachment would lie against the plaintiff, because the Court was unanimously of opinion that, under the peculiar circumstances of this case, an attachment should not be granted.—The Court, however, considered the conduct of plaintiff highly objectionable, and therefore directed that the rule for an attachment should be discharged, plaintiff paying the costs, such costs to be set off against his judgment in the action.

COURT OF QUEEN'S BENCH.—*In the Matter of Carus Wilson. The Jersey Jurisdiction.*—The Solicitor-General, with whom were Mr. Wortley and Mr. J. W. Smith, applied to the Court for a rule calling upon Mr. Wilson to show cause why a writ of *habeas corpus*, which was issued upon the order of Mr. Baron Rolfe, in the vacation, at the instance of Mr. Wilson, should not be quashed. The writ was directed to the viscount and gaoler of the Island of Jersey, and commanded that the body of Mr. Wilson should be brought up into this Court upon the 15th of the present month, for the purpose of ascertaining the legality of his commitment and detainer in the prison of St. Helier's. The learned gentleman here observed, that he wished, before he proceeded any further in his address, to state that he did not, upon the present occasion, appear in his official capacity as one of the law officers of the Crown, but merely as an individual member of the bar, acting in the ordinary course of his profession in this case as in every other. He was the more desirous of making this statement as it happened that upon a former occasion, when he made a similar application to Mr. Justice Patteson, a most extraordinary mistake was made, and publicly expressed upon the subject. The learned counsel then proceeded to state that the first objection to the writ in question was, that being awarded by a Baron of the Exchequer, it issued under the seal of the Court of Queen's Bench, and was therefore in a form which made it absolutely void—a Baron of the Exchequer having no power in vacation to issue a *habeas corpus ad subjiciendum* under the seal of the Court of Queen's Bench. The decision of this question would of course depend upon the consideration of the statutes upon the subject; the first of which was the act of the 31st of Charles II., cap. 2, which authorised any Judge in certain cases, not including those relating to criminal or supposed criminal matter, to award that a writ of *habeas corpus* should issue under the seal of the particular Court of which the Judge who awards the writ shall then be a member. The 56th of George III., which was the next statute upon the subject, enacted that the writ may issue in vacation, but under the restriction mentioned in the former act—that the writ shall issue under the seal of the particular Court of which the Judge himself is a member. The next statute to which it was necessary to refer was the 1st and 2d of Victoria, cap. 45, which recited the preceding act of the 1st of William IV., "for the more effectual administration of justice." The statute of William IV. extended to single Judges the power to act in matters then pending in Courts to which the Judges did not belong; and the act of Victoria gave them jurisdiction over the issuing of writs of *certiorari* and *habeas corpus*. In reference to these two latter acts, the learned gentleman contended that they did not, even in their language, give any power to a Judge of one Court to award a *habeas corpus* to issue under the seal of another. But whatever may be the meaning to be deduced from the construction of the language of the two latter acts, the Solicitor-General contended that they were altogether inapplicable to the case, as the Channel Islands were not named in either of them; and Lord Coke and Mr. Justice Blackstone had laid it down that no act of Parliament was binding in Jersey, unless the island was expressly named in the act.—Lord Denman here observed that the difficulty which had arisen in consequence of the writ not having been made returnable in the Court of Exchequer was deserving of consideration.—The Solicitor-General observed, that there were other grounds upon which he was desirous of obtaining the rule. One of them was, that out of the occasions upon which the writ was to be awarded was excepted the case of criminal or supposed criminal conduct, and that a contempt of Court, for which Mr. Wilson had been committed, was of the nature of criminal conduct, had been decided by the cases of Mr. Long Wellesley and Mr. Lechmere Charlton. The learned gentleman then proceeded to dwell upon the inconvenience which would result from the introduction of the practice of issuing writs of *habeas corpus* into Jersey. The Attorney-General of the island made an affidavit that the laws of the island were entirely different from those of this country; and he (the Solicitor-General) believed that if the practice were established, it would give rise to numerous applications of the same nature, and the Royal Court of Jersey would be continually under the necessity of justifying itself before the Court of Queen's Bench. It was, on the other hand, well known that there existed another tribunal, to which recourse may be had, as the Queen in Council had even legislative authority over the island. The learned counsel, whilst making these observations, added, that he did so from a desire to mention at present, in a general way, all the topics connected with the subject, reserving the full discussion of the whole case for a future occasion. He should, therefore, only refer at present to the *dictum* of Lord Mansfield, in the case of "The King v. Cowle," in which his Lordship observed, that where any of the superior Courts in England found that they could not with effect make a decision upon the merits of the commitment, they would not grant a *habeas corpus*, and for this reason would not order it to issue into Jersey: that he (Lord Mansfield) had never known such a proceeding adopted by any court of law, but had known cases in which an application was made to the King in Council. In conclusion, the learned counsel complained of the conduct of the parties by whom the writ was obtained, and referred to a letter of Mr. Wilson to the bailiff, in which, after expressing his indignation at the feudal violence which was practised against himself, and the obscene language addressed to his wife, he declared that murder would be the result, even if the writer were himself obliged to take the life of the person to whom the letter was addressed. It was stated in the affidavit upon which the writ had been obtained, that Mr. Wilson had great difficulty in making an affidavit, as the bailiff and jurats had refused to receive it. But he (the Solicitor-General) had an affidavit from the bailiff and 11 of the jurats (the 12th being unwell) expressly contradicting that statement, and saying that they were always ready to receive his affidavit, but that it was not tendered for their acceptance. The Royal Court had in fact no feelings of a vindictive nature against Mr. Wilson, and had already offered to admit him to bail upon his complying with the necessary conditions to that effect. The rule nisi was granted. Some conversation then took place about the course in which the present and the already existing rule should be heard. It was finally agreed that the present rule should take the usual course, and that the rule already fixed for the 18th should be enlarged to the 23d.—*Hope* v. *Harman and Others*. This was an action of trover to recover a collection of jewels, worth about 40,000*l*., which was given by the late Mr. H. P. Hope to his nephew, Mr. A. B. Hope, the third son of the late Mr. T. Hope, of Duchess-street. The intention of Mr. H. P. Hope to give this valuable collection to Mr. B. Hope was expressed in a deed which he executed some considerable time before his death, and not in any immediate contemplation of that event, but which was not delivered until after his decease; no intimation having been given by him during his life either to Mr. B. Hope or to any of the family of the existence of the deed in question. The defendants in the action are the executors of Mr. H. P. Hope, and the plaintiff is the owner of the jewels; and the question upon the trial of the cause was, whether the deed in question was intended by Mr. H. P. Hope to operate as a then present gift of the jewels in such a manner as immediately to transfer the interest in them to Mr. B. Hope? or whether the instrument was only to operate after his death, and was therefore in the nature of a will? In one case the collection would altogether belong to Mr. B. Hope; in the other, it would become part of the residue of Mr. H. P. Hope's estate, and become equally divisible among his three nephews. The case came on to be tried at the sittings of the last term, and the Jury found a verdict for the plaintiff. Sir T. Wilde now, upon the part of the defendants, applied for a new trial, upon the ground that the evidence which was given at the trial showed that Mr. H. P. Hope did not intend that Mr. B. Hope should have any right to the possession of the jewels during the life of Mr. H. P. Hope himself; and that the instrument in question, notwithstanding some circumstances in the form of it, was in substance not a deed but a will; and that the only object of Mr. Hope in adopting that mode of proceeding was to evade the payment of the legacy duty, which he considered a most unjust and impolitic imposition. The Court granted the rule.

Miscellaneous.

Antiquities of Bisutum.—By letters from the frontiers of Persia, dated the 8th Nov., we learn that Major Rawlinson, the English Commissioner appointed to arrange the differences between Turkey and Persia, had returned to Bagdad from his expedition to the frontiers. Major Rawlinson had also visited Bisutum, where he spent some days in copying and deciphering the important cuneiform or arrow-headed inscriptions which are found upon the great rock at that place. It is well known that the ruins existing here are believed to mark the site of Baghistana, a name intimately connected with the ancient Assyrian history and with the expedition of Semiramis. The inscriptions, which are engraved under a sculpture of vast proportions, representing a triumphant king passing judgment upon the conquered, are the longest known to exist in the cuneiform character. They are divided into three columns, and respectively represent the Babylonian, Median, and ancient Persian languages. Unfortunately the Babylonian characters, which, from their connection with the important ruins of Babylon, and the numerous inscriptions on bricks and stones brought from them, are of the greatest interest, are almost completely obliterated. The others are nearly perfect. Major Rawlinson had succeeded some years ago in deciphering a portion of the inscription, in the simple cuneiform, and in a dialect of the Pehlevi, Zend, or ancient Persian language, and had believed the inscription to contain certain annals of Persian history. His former supposition is now completely confirmed, and the inscriptions contain a history of the kingdom under the Kyanian dynasty, down to the middle of the reign of Darius (qu., Hystaspes?) whose effigy is represented in the sculpture above as the conquering King, and who himself caused the sculptures and inscriptions to be made on his vast rock. The inscriptions are well known, but from the almost inaccessible position they occupy no one had hitherto succeeded in copying them. The French artists, Messrs. Coste and Flandin, who accompanied the French embassy to Persia, were compelled to renounce the undertaking after many attempts, persevered in for several days. Sir R. Ker Porter declares that it would take three months to copy them with the aid of a telescope.—*Malta Times.*

The Cure of Consumption.—The *Medical Gazette* contains a long article from the pens of Dr. Hastings and Mr. Robert Storks, surgeon, descriptive of a remarkable operation for the cure of consumption, by the perforation of the cavity of the lung through the walls of the chest. It consists in making an opening between the ribs into the cavity which forms in the lung during the latter stages of consumption. The immediate effects of the operation (which requires only a few seconds for its performance, and which causes but slight pain) in the case in question was the diminution of the frequency of the patient's pulse, which fell in 24 hours from 120 to 68; freedom of respiration, which had been a very distressing symptom; loss of cough and expectoration, both of which had been very severe. This operation, which has established the possibility of curing this hitherto fatal disease, appears to have been completely successful, the report of the condition of the patient a month after its performance being, that he was rapidly regaining his flesh and strength, whilst his respiration had become natural, his pulse had fallen to 80, and his cough and expectoration had wholly ceased.

The Weather in France.—They write from Lyons:—"After the intense cold which we experienced in the beginning of December, and whilst Italy, Spain, and several other parts of the south of Europe are still covered with snow, and whilst the cold in several countries of the north rages with extreme rigour, we here enjoy an anticipated spring. Violets are in blossom in the environs of our city, and would seem to indicate that we have already reached the end of March. This temperature also prevails in the Alps. The passage over Mount Cenis, for instance, is easily effected, and at Lans-le-Bourg, at the foot of the mountain, travellers suffer from dust, instead of meeting snow, as is generally the case at this season."—*Moniteur.*

Statistics of Wesleyanism.—The *Wesleyan* says there are 426 circuits in Great Britain, and 1129 itinerant and supernumerary preachers, averaging 2 to 3 to each circuit. There are 14,413 local preachers, averaging [illegible] to each circuit. The number of sermons delivered weekly by itinerant and supernumerary preachers is [illegible], or 205,452 in the year. The number of sermons by local preachers weekly is 11,641, or 605,332 in the year. The number of miles annually travelled by itinerant preachers (exclusive of special journeys and conference), 314,692; number of miles annually travelled by local preachers, 2,947,448; total, 3,261,140 miles, or a distance equal to 130 times the circumference of the globe.

BIRTHS.—4th inst., at Ascog Lodge, Bute, LADY K. MURRAY, of Ochtertyre, of a son—11th inst., at 38, Grosvenor-sq., the Hon. MRS. CAPEL, of a son—11th inst., at Tulse-Hill, Surrey, Mrs. BRAND, of a son—13th inst., at North End, Fulham, the lady of Capt. DAWSON, Royal Engineers, of a daughter—14th inst., Mrs. T. C. METHLEY, of Frith-street, Soho, of a daughter—14th inst., at Grove-end-road, St. John's Wood, Mrs. E. FAGG, of a daughter.

MARRIAGES.—14th inst., at St. Pancras Church, H. KEYWORTH, Esq., of York, to MARIA J. FRITH, 11, Osnaburgh-terrace, Regent's Park, and only daughter of the late Thomas Frith, Esq., of Harrogate—14th inst., at St. George's, Bloomsbury, the Rev. F. STYLE, M.A., to LOUISA C. NEWTON, second daughter of the late Mr. Robert Turton Newton—14th inst., at St. George's, Hanover-square, T. ENIS, Esq., to SARAH H. Moss, eldest surviving daughter of the late Lieutenant-Colonel Moss, Bombay Artillery.

DEATHS.—8th inst., at Elton-hall, Herefordshire, J. C. HAWKINS, Esq., eldest son of Sir J. C. Hawkins, Bart., aged 39—9th inst., at Beresford-sq., A. RIXON, wife of Mr. R. RIXON, and younger daughter of Mr. Pettigrew, of Woolwich—6th inst., after a long affliction, SUSAN PICKERING, the beloved wife of George Clarke Pickering, Esq., of Earl Soham, Suffolk—10th inst., at Brunswick-square, Brighton, ELIZABETH [illegible], relict of the late Henry Turner, Esq., of Stockwell, Surrey, aged 83—10th inst., in New Ormond-street, W. TAYLOR, Esq., B.A., of Queen's College, Cambridge, and formerly of Kingston, Jamaica—10th inst., after a short illness, S. MEREDITH, Esq., of Brixton, Surrey, aged 56—10th inst., S. A. LEEKS, Esq., of the War Office, aged 68—13th inst., at her seat, Durrington-house, Essex, H. E. S. GLYN, relict of Colonel Glyn, of the 1st Regiment of Foot Guards, aged 75—14th inst., at Ivy house, Woodford, Essex, MARY J. FORSTER, wife of Edward Forster, Esq., aged 80.

WANTED—A Good Gardener about 36. He must well understand Greenhouse, Frames, Flower, and Kitchen Gardens; also the care of a very small farm. As he will reside in the house, the strictest character for probity, sobriety, and general good conduct will be indispensable—Direct W., Messrs. HURST and M'MULLEN, Seedsmen, &c., Leadenhall-street.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER.—A married Man, aged 28, without incumbrance, who possesses a good practical knowledge of his profession in all its branches, and can be highly recommended by his employer.—For particulars apply to Messrs. WM. WOOD and SON, Nurserymen, Maresnest, near Uckfield, Sussex.

AS HEAD GARDENER.—A respectable married Man, aged 38, who understands Pines, Vines, Early Forcing, Kitchen, and Flower-Garden. Has lived in many respectable families; and a most satisfactory character of the last years will be given. Left his last situation on account of the employer giving up his country residence.—Direct to A. B. C., at Mr. Pitcher's, Hair-dresser, North-end, Croydon, Surrey.

AS FOREMAN OR SECOND GARDENER.—A young Man of good character, in an establishment where six or more hands are kept.—Direct to GEORGE T. COZENS, Westmore-gardens, Stoke-road, Gosport.

AS GARDENER.—A steady, active, single Man, aged 33, who has a thorough practical knowledge of the business in all its branches, and can be highly recommended for character and ability. No single-handed place will be accepted.—Direct to A. B., at Mr. Glendinning's, Nursery and Seedsman, Chiswick Nursery.

AS GARDENER, or UNDER-GARDENER.—A Married Man, aged 27. Would have no objection to look after a horse and chaise. Can have a good character. Direct to A. B., Mr. Atkins, Greengrocer, Tulse Hill, Brixton.

AS GARDENER, or to take Charge of a Nursery.—A middle-aged unmarried man, who has acted as journeyman in some of the best gardens in England and Scotland, for the space of 12 years—as Gardener four years, and the last eight years as out-door Propagator, and otherwise taking an active part in one of the principal Nursery establishments in Edinburgh. The Advertiser is a Scotchman by birth, and about 40 years of age.—Direct, X. Y. Z., Post-office, Edinburgh.

TO NOBLEMEN AND GENTLEMEN

AN EXPERIENCED GARDENER, in the highest branches of Horticulture, having a few months since left an excellent place, with a prospect of entering into a Nursery business, but not having succeeded therein, wishes again for a situation as a Nobleman's or Gentleman's family, where forcing in all its branches is carried on. The Advertiser will state the least salary he will accept, his ability in any way desired, and a character of the best sort can be obtained. No single-handed place will suit.—Direct R. L., care of Messrs. Child, Seedsmen, Thames-street, London.

AS FARM BAILIFF.—A young Man, 30 years of age, who has had 10 years' experience in stock and arable farming in the Lothians of Scotland; is thoroughly acquainted with the laying out and general cropping of land, buying and selling of stock, &c.; and has studied two years at the Veterinary College of Edinburgh, under Professor Dick. The most unexceptionable reference will be given as to character and qualifications, by applying to C. Mallock, Esq., Chelmondiston House, with whom the Advertiser is at present living as Bailiff.—Direct to Mr. JAMES LESLIE, C. Mallock, Esq., Chelmondiston House, near Torquay, Devonshire.

AS BAILIFF, an active Middle Aged Man, who has the entire management of a Stock and Arable Farm for upwards of 20 years, understands the Flooding and Draining of Land, and his wife the management of a Dairy. They are used to active work, and can give unquestionable reference (and security if required) as to sobriety, steadiness, and general character.—No family.—Direct B. B., Post-office, Wendover, Bucks.

TO FARMERS IN THE MOST IMPROVED AGRICULTURAL DISTRICTS OF SCOTLAND AND THE NORTH OF ENGLAND.

A YOUNG MAN who has learned Practical Farming in the most highly cultivated part of Norfolk, wishes to obtain a little further experience, and is willing to give any gentleman, farming in either of the above districts, his services (if found equivalent) for his board, &c. The best references will be given.—Direct, with full particulars, to M. N., 196, High Holborn, London.

The Newspaper.

SATURDAY, JANUARY 25, 1845.

ARGUS LIFE ASSURANCE COMPANY,

39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 Will. IV. c. 76.

Thomas Farncomb, Esq. Alderman, *Chairman.*
William Leaf, Esq. *Deputy Chairman.*

Richard E. Arden, Esq.	J. Humphery, Esq. Ald. M.P.
William Banbury, Esq.	Rupert Ingleby, Esq.
Edward Bates, Esq.	Thomas Kelly, Esq. Ald.
Thomas Camplin, Esq.	Jeremiah Pilcher, Esq.
James Clift, Esq.	Lewis Pocock, Esq.

Physician—Dr. Jeaffreson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq. 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.

Low Rates of Premiums.

In addition to the subscribed Capital of 300,000*l.* the assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and an accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company.

The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to Assure 100*l.*

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 19 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money, as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus Office will be found to be particularly favourable to the assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, WATERLOO PLACE, PALL MALL, LONDON.

The Chisholm, *Chairman.* W. Morley, Esq., *Dep. Chairman.*

GREAT ADVANTAGES OFFERED TO POLICY-HOLDERS BY THIS INSTITUTION.

A large and immediate accession of Assurances, by the transfer of the Policies of the "Achilles British and Foreign Life Assurance Association."

PROFITS.

The whole of the Profits divided ANNUALLY among the Members, after payment of five Annual Premiums.

An ample guaranteed Capital, in addition to the Fund continually accumulating from Premiums *fully sufficient* to afford complete security.

CREDIT.

Credit given to Members for half the amount of the first five Annual Premiums, without security.

Credit allowed to Members for the whole of the first five Annual Premiums, on satisfactory security being given for their payment.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Members.

Loans granted upon approved Security.

An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying up the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.

Extract from the Reduced Scale of Rates, for an Assurance of 100*l.*

AGE.	ANNUAL PREMIUM. ONE YEAR.	SEVEN YEARS.	WHOLE LIFE.
	£. s. d.	£. s. d.	£. s. d.
20	1 0 9	1 1 6	1 13 11
30	1 2 9	1 3 3	2 2 1
40	1 5 6	1 7 6	2 16 4
50	1 15 9	2 1 6	4 1 11
60	3 3 5	3 17 0	6 8 3

Full particulars are detailed in the Prospectus.

A. R. IRVINE, Managing Director.

NORTH BRITISH INSURANCE COMPANY,

Established 1809. His Grace the Duke of Sutherland, K.G., President: Sir Peter Laurie, Alderman, Chairman of the London Board; Francis Warden, Esq. (Director H.E.I.C.), Vice Chairman; John Webster, M.D., F.R.S., 24, Brook-street, Physician.

THIRD DIVISION OF PROFITS.

The Third Septennial Investigation of the Company's Affairs took place on the 31st December last.

This Institution is incorporated by Royal Charter, and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy Holders, combined with perfect security, in a fully subscribed Capital of One Million Sterling, besides an Accumulated Premium Fund, exceeding Four Hundred Thousand Pounds, and an Annual Revenue of Eighty-seven Thousand Pounds.

Fire Insurances may be effected on Private Houses, Country Mansions, &c. at the lowest rate of Premium.

A Prospectus, containing Tables of Premiums, with the names of the President, Vice Presidents, Directors, and Managers, who are all responsible Partners, may be obtained of Messrs. B. and M. BOYD, 4, New Bank Buildings, or of the Actuary, 10, Pall-Mall East.

JOHN KING, Actuary.

THE GARDENERS' CHRONICLE, to be Sold, complete from its commencement. The first Volume, bound, price 3 guineas and a half.—Apply to Mr. HOLT, 56, Waterloo-street, Leicester.—January 25.

UNIVERSITY COLLEGE HOSPITAL.

The Committee return their sincere THANKS to the Annual Contributors to this Charity for the promptness with which the subscriptions for the new year have been paid. They also publicly and gratefully acknowledge the receipt of the following recent benefactions:—

DONATIONS.

* Life Governors.				† Additional Contributions.			
The Worshipful Company of Mercers	£100	0	0	†Miss Yenn	£2	2	0
†Miss Dealtry	21	0	0	†William Bull, Esq.	1	1	1
†A.B. per London and Westminister Bank	20	0	0	The Executors of the late Francis Baily, Esq. (legacy)	200	0	0
A. Black, Esq.	10	10	0	The Executors of the late E. Walpole, Esq.	100	0	0
Abraham Day, Esq.	10	10	0	The Executors of the late Thomas Debney, Esq. (legacy)	40	0	0
George Robins, Esq.	10	10	0				
*J. Hibbert, jun., Esq.	10	10	0				
†J. W. Milne, Esq.	10	0	0				

New Annual Subscriptions.

†Martin Thackery, Esq	£5	0	0	John Harris, Esq.	£2	2	0
†Thomas Harris, Esq.	3	3	0	†J. W. Levesey, Esq.	1	1	0
E. F. Mathew, Esq.	3	3	0	George Ridsdale, Esq.	1	1	0
O. DeBeauvoir Priaulx, Esq.	3	3	0	The Misses Ridsdale	1	1	0
Mrs. Wilson	3	3	0	The Rev. S.F. Statham	1	1	0
				Clement Tudway, Esq.	1	1	0

It will be a satisfaction to the benevolent persons who have thus bestowed their charity to be assured that the value of their aid is enhanced by its seasonableness. The eagerness for the advice and treatment of the medical officers and attendants of this Hospital, not only on the part of the destitute sick in the neighbourhood, but of poor persons afflicted with disease in distant parts of the kingdom, has recently occasioned an increase in the number of patients, and a consequent augmentation of expense, which has weighed heavily on the limited resources of the Hospital.

It still stands in urgent need of additional support.

The number who annually receive relief at this Hospital is nearly 15,000. The expense amounts to about 4500*l.*, of which the principal portion, namely, 2800*l.*, is derived from the fees of students for attendance on the practice of the medical and surgical officers, by whom they are devoted to the maintenance of the Hospital. The annual subscriptions, notwithstanding a late considerable increase, do not exceed 600*l.* After allowing for casual donations, a deficiency of about 1000*l.* has yearly to be provided for.

The Hospital is destined for the accommodation of a much larger number of patients than can be relieved under the present state of its funds. The ground for a second wing to the Hospital is lying waste; while such a wing, if the means of erecting, furnishing, and maintaining it existed, and it were completed, would allow of a further increase of 50 in-patients.

Donations and subscriptions will be received by the following bankers:—Coutts and Co., 59, Strand; London and Westminster Bank, Bloomsbury Branch; Scott and Co., 1, Cavendish-square; Smith, Payne, and Smith, 1, Lombard-street. At the Hospital, the House Physician, the Matron, and Clerk to the Committee have printed receipts, signed by the Treasurer, ready for delivery to benefactors. WILLIAM LONG, Clerk to the Committee.

Jan. 23, 1845.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, ARCHITECTS, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally adopted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. WEEKS and DAY have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c. &c.

THE HAIR.—Of the numerous compounds constantly announced for promoting the growth or reproduction of the Hair, few survive, even in name, beyond a very limited period, whilst ROWLAND'S MACASSAR OIL, with a reputation unparalleled, is still on the increase in public estimation. The singular virtues of this successful invention for Restoring, Preserving, and Beautifying the Human Hair, are too well known and appreciated to need comment. The very facts of the high and distinguished patronage it enjoys, its general use in all countries, together with numerous testimonials constantly received in its favour, are authorities which stamp its superior excellence and title over all attempts of a similar nature. Being universally preferred, its consequent great demand excites the cupidity of unprincipled shopkeepers, who vend the most spurious trash as the "genuine" Macassar Oil; whereas, the genuine article is wholly the invention and property of A. ROWLAND and SON, and the amalgamation of its costly exotic materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "Macassar Oil." The genuine article has the words ROWLAND'S MACASSAR OIL, engraved in two lines on the Wrapper; and on the back of the wrapper, nearly 1500 times, containing 29,028 letters.—Price 3*s.* 6*d.*—7*s.*—Family Bottle (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per Bottle. Sold by the Proprietors at 20, Hatton Garden, and by Chemists and Perfumers.

**** All other Articles sold under the same name are FRAUDULENT COUNTERFEITS.

LINGHAM, BROTHERS, BIRMINGHAM. — MANUFACTURERS of the IMPROVED MENOGRAPH, or PERMANENT LABELS, for Garden-borders, Flower-pots, &c. In Boxes of One Hundred each.

The above Labels have been manufactured by LINGHAM, BROTHERS, for the last five years with increasing demand, and acknowledged by those parties who have used them as superior to anything of the kind before offered to the Public, and for neatness, durability, and cheapness, have superseded all other kind of Labels for Horticulan purposes.

Sole Agents in London:—George and J. Dean, Horticultural Implement Warehouse, 46, King William-street, London-bridge.

ABERNETHY'S PILE OINTMENT.—An efficacious remedy for the Piles has been long wanted, for there is no disease productive of greater suffering; a sense of delicacy frequently preventing a timely application for medical aid, the use of improper aperients, and various other causes, tending greatly to increase the malady. The proprietor of this invaluable Ointment was, some years since, a complete martyr to the disease; and after consulting many of the London physicians and surgeons without success, was at length induced to consult the late celebrated Abernethy. He prescribed an Ointment—a small portion was applied to the parts affected going to bed, and the pains ceased, as if by magic. The proprietor has tried it amongst a number of his friends, and invariably with success; he now offers it to the public, with full confidence of its successful results. Many medical men have pronounced it to be the most effectual remedy for this complaint they have ever tried. Sufferers will not repent giving it a trial. Multitudes of cases of its efficacy might be produced, if the nature of the complaint did not render those who have been cured unwilling to publish their names.

Sold in covered pots, at 4*s.* 6*d.*, with full directions for use, by C. KING (Agent to the Proprietor), Napier-street, Hoxton, London; where also can be procured every Patent Medicine of repute, direct from the original makers, with an allowance in taking six at a time.

**** Be sure to ask for "Abernethy's Pile Ointment," and observe the name of C KING on the Government Stamp affixed to each pot, price 4*s.* 6*d.*, which is the lowest price the proprietor is enabled to sell it at, owing to the great expense of the ingredients.

Sold by all respectable Chemists and Medicine Vendors in every Market-town throughout the United Kingdom.

READ the following TESTIMONIAL in favour of PARR'S LIFE PILLS, which is sufficient to convince the most prejudiced person that they are all that is required to conquer disease, and consequently prolong life:—"To T. Roberts and Co.—Sirs,—I beg to hand you the following testimonial, which I have just received from Mr. Williams, Union-street, Nottingham.—Yours obediently, G. BATTERS, Chapelbar, Nottingham."

"Sir,—Printing is a great blessing to mankind, for now I am enabled to make known, through you, a perfect cure, by taking PARR'S LIFE PILLS, of extremely bad Indigestion, a Bilious disorder, and Sick Headache, which I have been subjected to for years; and money enough has been paid to physicians and surgeons, which now would have been a little fortune to me. I wish every fellow-creature clearly to understand that I was wonderfully relieved by taking one box of PARR'S LIFE PILLS. Accident threw a testimonial in my way of a miraculous cure of a bilious attack and sick headache. The second box enabled me to go about my business with spirit and alacrity; and by taking two or three more boxes, I am happy to add my humble testimony of a perfect cure of that dreadful disorder—Bilious and Sick Headache—which rendered me, before I took PARR'S LIFE PILLS, unfit for business. Considering the loss of time and pain, persons would find that one box of PARR'S LIFE PILLS is worth, instead of 1*s.* 1½*d.*, as many guineas. May all persons make trial of PARR'S LIFE PILLS, is the sincere wish of, yours thankfully,

"To Mr. G. Batters." M. WILLIAMS, Union-st., Nottingham."

PARR'S LIFE PILLS are sold by all respectable Medicine Vendors. See the words "PARR'S LIFE PILLS," in White Letters on a Red Ground, on the Government Stamp.

News of the Week.

THE debate on the Address in the French Chamber will be read with attentive interest in this country, as a most important manifestation from the first statesmen of France on the merits of the English alliance. The debate in the Peers terminated more satisfactorily for Ministers than they or their opponents had anticipated, the Address having been carried, after a few unimportant amendments, by a majority of 75. The details of the various speeches which preceded the division are of unusual interest to the English reader, since all the attacks of the Opposition, whether on the affairs of Tahiti or Morocco, are directly referable to the supposed influence of Great Britain on the deliberations of M. Guizot's Cabinet. The policy of the English alliance was thus made one of the chief features of the discussion. The leading statesmen of the Opposition, although differing in their estimate of the value of this alliance, made the remarkable declaration that they are as warmly in favour of a good understanding with this country as M. Guizot himself. They charged the Minister with neglecting opportunities for advancing the interests of France from an apprehension of fresh complications with England; and censured him for having created the complications then existing, by petty conquests which could bring no honour to France, and could have no other result than that of endangering a peace, for which he was ready to make unworthy sacrifices. The Ministers, in their defence, were compelled to plead a disregard to the susceptibilities of England in all their operations on the coast of Morocco, and especially to appeal to the destruction of Mogadore and Tangiers, the two seats of British commerce with the Moors, as proofs that they were determined to act independently of this country. The debate in the Chamber of Deputies began on Monday, and promises to be more exciting, if not more important, than that in the Peers, since the fate of the Ministry is considered to depend on its results. The debate, as far as it has yet gone, derives nearly all its interest from the fact that the English alliance appears to have been the predominant idea in the minds of the different speakers. As the debate in the Peers derived its first importance from the attack of Count Molé, so has that in the Deputies been rendered more exciting by a speech from M. Thiers at an earlier period of the discussion than was anticipated. The burden of this speech, though ostensibly directed to the questions of Tahiti, Morocco, and the right of search, was an attack upon the Ministerial policy in regard to England. M. Thiers expressed a warm conviction of the benefits of the English alliance, and fully concurred in Count

Molé's declaration that no statesman in France could be insensible to the necessity of a good understanding with this country. He condemned, therefore, everything which could have endangered that alliance, and contended that by seizing a few miserable islands in the Pacific the Government had compromised the interests of France, and placed her in so critical a position that she could neither evacuate nor retain them. He said that the complications arising from these difficulties had embarrassed the Ministry in all their subsequent acts, and had compelled them to conclude an unworthy treaty with Morocco. This speech caused a great sensation in the Chamber, and was considered so important by M. Guizot that, although the sitting was far advanced, he instantly rose to answer it. In this reply he entered at great length into all the questions at issue, stating in detail the successive measures adopted against Morocco, and giving his view of the origin and progress of the Tahiti troubles down to the expulsion of Mr. Pritchard. For these particulars we must refer to the speech itself, of which we have given in another column as full a summary as our space admits. It is sufficient to add that the division on an amendment to the first paragraph gave Ministers a majority of 28. The importance of the debate in general can hardly be overrated, and it is, perhaps, one of the best proofs of this fact, that several of the London morning papers have had their own Reporters in the Chambers, for the purpose of obtaining the fullest and earliest details of the proceedings.

In Ireland, Mr. O'Connell has apologised to Archbishop Crolly for stating that the rescript of the Propaganda was not a canonical document. In a letter which he has addressed to that Prelate he retracts "at once and unequivocally" any assertion of his that may apply to the document as being uncanonical, and adds that if his private opinion were otherwise, he would at once bow to the authority with which the document is now clothed. At the Repeal Association on Monday, Mr. O'Connell denied that the rescript had anything to do with the Repeal agitation. He declared that its object was not to interfere with the laity or with Repeal, but was simply intended to keep up and promote the spirit of benevolence and charity. He admitted, however, with expressions of regret, that there was some truth in the statement that the discussion produced by the Bequests Act had tended to damp the agitation for Repeal. He said that though the concordat was denied, something more injurious was meditated; and he proposed that Lord Ffrench, and his son, Mr. John O'Connell, should be sent to Rome as delegates from the Association, in order to lay their case before the Pope, and implore his Holiness not to thwart them in their exertions to obtain a restoration of their domestic legislature.

Home News.

COURT.—Her Majesty and Prince Albert returned to Windsor Castle on Saturday from their visit to the Duke of Buckingham at Stowe. On Sunday the Queen and Court attended Divine service in the private chapel of the Castle, and the Prince afterwards walked for some time in the pleasure-grounds. On Monday the Queen and Prince left Windsor for Strathfieldsaye, on a visit to the Duke of Wellington, and returned to the Castle on Thursday. During Her Majesty's absence the royal infants have been perfectly well, and have taken their usual airings.—The Grand Duchess of Mecklenburgh Strelitz is convalescent, and no bulletins have been issued since Monday.—It is stated that Ministers have made such an arrangement as will increase the income of Mlle. D'Este to 1000*l.* a year; being equal to that which she enjoyed during the lifetime of his late Royal Highness the Duke of Sussex.

THE QUEEN'S VISIT TO STOWE.—Our account last week brought the details of Her Majesty's visit down to Thursday night. During Her Majesty's walk on the afternoon of that day, the royal party visited in succession the whole of the classic temples with which the park abounds. Whilst in the museum, which is situated in the lower flower-garden, and contains, among many other remarkable subjects, the fine collection of the late distinguished mineralogist, the Abbé Haüy, Dr. Buckland explained the nature and composition of many of the most curious specimens to Her Majesty. The afternoon was delightfully fine, and it is stated that Her Majesty expressed herself in the highest terms of gratification at all she saw, remarking that no previous impression had given her an idea of the extreme beauty either of the house or its grounds. The royal party were absent from the mansion nearly two hours. A pony-chaise was provided for the use of Her Majesty, but she did not avail herself of it. Her Majesty spent some time in inspecting the Duchess of Buckingham's aviary, which contains a most superb collection of Brazilian pheasants, black game, and a variety of other curious specimens of the feathered tribe. Her Majesty having signified her pleasure to receive the county and borough addresses before dinner, the guests assembled in the Marble-hall shortly before 8 o'clock, to witness the ceremony. Mr. Barnes, High Sheriff of the county, was first introduced to Her Majesty, and having presented the county address in the usual form, the Queen graciously received the same, and handed it to Sir J. Graham. Mr. Barnes had the honour of kissing hands. The same ceremony took place with the borough address, Mr. Henry Smith, Mayor of Buckingham also having the honour to kiss hands. In the course of the evening M. Jullien and his band attended, and performed several pieces of music in the marble-hall. Both Her Majesty and the Prince expressed their approbation of the selection and execution of the music. The concert did not terminate until after midnight, but Her Majesty retired shortly after 11 o'clock. On Friday morning the Queen and Prince breakfasted, as usual, alone, but did not attend prayers in the chapel as on Thursday. At 10 o'clock Prince Albert, with the Duke of Buckingham, the Earl of Jersey, Col. Bouverie, Mr. Anson, Capt. Carrington, and Mr. Roberts left the mansion for Stratford-hill Wood, a preserve about a mile from the mansion. The party were absent less than two hours, during which period the Prince killed with his own gun 80 pheasants, 66 hares, and 2 rabbits, making a total of 148 head. It is said that his Royal Highness has been greatly delighted with his visit, and says that he has never before enjoyed such sport as his noble host's covers afford. Her Majesty did not leave the house in the morning, but completed her inspection of its contents, and spent some time in the library. On the return of the shooting party, luncheon was served in the tapestry dining-room. The centre of the table was filled by a gold camp tray, formerly in the possession of Napoleon, and taken from his brother Joseph's carriage at the battle of Vittoria. While the shooting party were absent, Sir R. Peel, the Earl of Aberdeen, Earl Delawarr, and many other guests, visited the manuscript library, the valuable contents of which were explained by Mr. Smith, librarian to his Grace. Shortly after 3 o'clock this afternoon Her Majesty left the mansion, leaning on the arm of the Duke of Buckingham, and proceeded to that portion of the grounds overlooking the Elysian Fields, on the summit of which the Temple of Concord and Victory is erected, for the purpose of planting some trees near that spot. Prince Albert followed with the Duchess of Buckingham, and many of the other guests were of the party. On reaching the south side of the temple, the Duke of Buckingham having handed the Queen an oak sapling, Her Majesty placed it in the ground, and then received from Mr. Ferguson, the Duke's head-gardener, a spade, with which Her Majesty covered the roots, the Duke of Buckingham and Mr. Ferguson completing the work, while Her Majesty kept the tree in an upright position. Prince Albert then planted a young cedar tree at a short distance from the spot, and Her Majesty and the Prince having each planted two similar trees on the north side of the temple, the Duke of Buckingham called out "God bless her Majesty the Queen," a sentiment answered first by the cheers of the noble party present, and re-echoed by about 200 persons who were congregated in the park at a point from whence a view of the interesting ceremony was obtained. The royal party then returned to the mansion. The dinner party in the evening consisted of 36 persons, including Capt. and Mrs. Dupre, M.P., Capt. and Mrs. Fitzmaurice, Mr. Rice Clayton, and Mr. and Mrs. Scott Murray. In the evening there was a concert, which was attended by a large number of the nobility and gentry of the county. The Queen entered the concert-room at 10 o'clock. As soon as Her Majesty was seated, the presentations commenced; the Duke of Buckingham, who wore his full uniform as Colonel of the Bucks Hussars, with the riband and star of the Order of the Garter, introducing the guests as they entered the saloon to Her Majesty, who bowed graciously as each one passed the Royal presence. The company proceeded from the presence-chamber into the grand library, and thence through another saloon into the corridor leading to the north and marble halls, the latter of which was the chief place of rendezvous. The Distin family attended during the evening, and played a selection of favourite airs on their silver Sax-horns, the performance being varied by the band of the 2d Life Guards. The Queen retired about half-past 11. On Saturday morning Her Majesty and Prince Albert breakfasted in their private apartments, and shortly after 10 o'clock the royal *cortège* left Stowe, both Her Majesty and the Prince having expressed their delight at the reception they had met with, and their appreciation of the efforts made for their entertainment by their noble host. Both the Duke of Buckingham and the Marquis of Chandos rode alongside the royal carriage. The party passed through the double lines of the Bucks Yeomanry, the artillery saluting, and the band playing the national anthem. At Buckingham they were met by the people in procession, formed into somewhat similar order as on the day of the arrival, and the usual demonstrations of loyalty and affection were vociferously bestowed on all hands. After leaving Buckingham the party proceeded rapidly towards Wolverton. The escort duty was arranged as before. At the different arches along the road, groups of the peasantry living in the neighbourhood had assembled, and vociferously cheered the Queen and the Prince as they passed by. At Page-hill the Duke of Buckingham stopped and took leave of his royal guests returning to Stowe. The Marquis of Chandos accompanied them to Wolverton. The Duke returned with the escort of Bucks Yeomanry, and joined the regiment at the lodge, entering the Park, where they were formed into a square. The Duke then informed the regiment that Her Majesty was so much pleased with them, that she had directed that they might be henceforth called *Royal*. Colonel Bernard, Major Lucas, Captains Holmes, Roberts, Bricknall, with the other officers, and the officers of the regiment of Bucks Artillery and Hussars, had the honour of dining at Stowe to commemorate the event. At Stony Stratford, the royal party was met by Lord Carington, Lord Lieutenant of the county, on horseback. The cavalcade proceeded slowly through the little town, the inhabitants of which greeted it right loyally. As at Buckingham the evergreens, flags, and ivy still decorated the streets. The distance from Stony Stratford to Wolverton was soon accomplished, and the *cortège* drove to the station at a rapid rate. Inside the station, the staff of the Bucks Militia, and a dismounted party of Yeomanry, under Major Lucas, were drawn up. A number of respectable people had also been admitted to view the arrival and departure. The usual preparations had been duly made, crimson cloth was laid over the platform, and the apartment destined for the reception of Her Majesty arranged as on the journey down. Mr. Glynn, the chairman of the company, Mr. Creed, the secretary, and several of the principal officials of the railway company were in attendance. The royal party arrived shortly before 12 o'clock. Her Majesty and the Prince retired for a short time to the apartment provided for them, and then the special train being reported in readiness, proceeded to the royal carriage. On the platform they took leave of the Marquis of Chandos and Lord Carington. Prince Albert conversed for some time with Lord Carington, who held the door of the royal carriage. At 12 o'clock the train was set in motion, and the distance from Wolverton to Euston-square, 52 miles, was performed in 1 hour and 25 minutes. Before leaving the Euston station, Her Majesty expressed to Mr. Glynn and the other directors present her satisfaction at the arrangements made for her convenience. The royal party proceeded to Cambridge House, to visit the Grand Duchess of Mecklenburgh Strelitz, and from Paddington by rail way to Slough, arriving at the Castle about 8 o'clock.

HER MAJESTY'S VISIT TO THE DUKE OF WELLINGTON.—On Monday the Queen and Prince Albert left Windsor Castle for Strathfieldsaye, on a visit to the Duke of Wellington. Her Majesty proceeded by Ascot heath and Fern-hill to Brocknell and Wokingham, when triumphal arches were erected, and the houses were gaily decorated in honour of the event. On reaching the Town Hall, the Corporation of Wokingham presented an Address to the Queen, which was very graciously received. At Aborfield Cross the *cortège* was met by a troop of the North Hants Yeomanry Cavalry, who relieved the 17th Lancers, which had formed the previous escort, at this point, and escorted Her Majesty thence to Swallowfield, a little village within three miles of Strathfieldsaye, where another escort, under the command of Colonel Charles Shaw Lefevre (Speaker of the House of Commons), and the Hon. Capt. Baring, M.P., were in attendance to accompany Her Majesty to Strathfieldsaye. About half-past 4 the escort was observed approaching. The Duke of Wellington immediately rode forward to meet Her Majesty, and on approaching the royal carriage it was stopped by order of the Queen, who from the window shook hands and entered into conversation with his Grace for some moments. The Duke then put spurs to his horse and galloped on to Strathfieldsaye, where he arrived in time to receive Her Majesty at ½ to 5. Her Majesty was saluted by a guard of honour of the North Hants Yeomanry, who, with band and colours, were stationed on the lawn, and as her Majesty alighted the band played the national anthem. A royal salute was fired as the Queen entered the house, and the standard was immediately hoisted on a flag-staff on the roof of the mansion. But for this indication of the presence of royalty, no passing traveller would have had any notion that Her Majesty was at Strathfieldsaye, as the royal visit was conducted with the utmost privacy. After the Queen's arrival, no military were seen in the Park, there was no guard, no yeomanry under arms, or any of the military pageantry which has been kept up on other royal visits. The reporters also appear to have been at fault, and the *Times* states that in answer to an application for admittance from some other paper the Duke characteristically replied that "he did not see what his house at Strathfieldsaye had to do with the public press." The visit appears to have been intended altogether as a private compliment to the Duke. Her Majesty on her arrival retired to her apartments, and joined the dinner circle at 8 o'clock. Her Majesty entered the dining-room resting on the arm of the Duke of Wellington, and was conducted to the seat of state in the centre of the table. Prince Albert sat on the right of Her Majesty, and the Duke of Wellington upon Her Majesty's left—the Duchess of Bedford and the Marchioness of Douro occupying the next places. The rest of the guests were the Duke of Bedford, Lady C. Wellesley, Lord and Lady Ashburton and the Hon Miss Baring, Sir W. Heathcote, Bart., M.P., Mr. and Mrs. Assheton Smith, the Right Hon. H. Pierrepont, Mr. Compton, M.P., the Speaker and Mrs. Lefevre, the Hon. and Rev. Gerard Wellesley, Mr. and Mrs. Hunter, Mr. Portal, and Mr. Bingham Baring, M.P. The Marchioness of Douro, the Earl of Jersey, the Hon. Miss Murray, Lord C. Wellesley, Colonel Bouverie, and Mr. Anson were in attendance on the Queen and Prince Albert. After dinner the Duke gave successively the healths of Her Majesty and Prince Albert, which were responded to with feelings of enthusiasm by the company. There was no performance of music during dinner. At a later period, when the company had retired to the library, where the evening was passed by Her Majesty and the majority of the guests, the band of the Grenadier Guards attended, and from the conservatory entertained the company by the performance of popular airs. Several of the gentlemen varied the evening's entertainment by adjourning to the billiard-room. The following, from among the families resident

in the vicinity, were added to the party in the evening: Capt. and Mrs. Brown, Mr. and Mrs. Pigott, Dr., Mrs., and Miss Keate, and Miss Walmesley. Her Majesty and the Prince retired before 11 o'clock. On Tuesday the Queen rose at 7, and during the morning walked with Prince Albert. After breakfast there was a shooting-party. A body of beaters was despatched to Lower Pitham Cover, the ground selected, and presently after the sportsmen sallied forth. The party who rode to the cover consisted of Prince Albert and the Duke of Wellington, who rode first, Sir R. Peel, the Duke of Bedford, the Earl of Jersey, the Speaker, Colonel Bouverie, and Mr. Anson. The sport was understood to be good, although the game killed was little in comparison to the battues of Stowe. The Prince despatched 45 head of game, including two woodcocks. After lunch the royal party drove to Bramshill, the seat of Sir John Cope. Bramshill is about five miles from Strathfieldsaye, and is one of the finest specimens of an old English mansion of the Elizabethan age. Her Majesty alighted and went over the house. Sir John Cope was absent from home on a shooting excursion. Mrs. Crashay, the housekeeper, however, acted as cicerone in conducting the royal party through the house, which contains much that is curious, and appeared very much to interest Her Majesty. Sir J. Cope returned home as Her Majesty was leaving Bramshill, and Lord C. Wellesley expressed to him the gratification Her Majesty had experienced. On this little excursion Prince Albert drove Her Majesty in a pony phaeton. The party returned about half-past 4 o'clock. The Duke of Wellington took his usual equestrian exercise in the course of the day, but did not accompany the party to Sir John Cope's. The dinner party at night, in addition to the former guests, included three officers of the Hampshire Yeomanry. In the evening were also present Sir H. and Lady Russell, Capt. and Mrs. Brown, and Miss Walmsley, Mr., Mrs., and Miss Beauchamp, and Mr., Mrs., and Miss Anderton. The band of the Foot Guards performed as before. After dinner the gentlemen of the party amused themselves in the billiard-room. Her Majesty retired about 11 o'clock. On Wednesday the Queen rose at her usual early hour, breakfasted in private with the Prince, but did not take her accustomed morning walk. Just opposite one of the fronts of Strathfieldsaye, and forming a part of the range of building principally appropriated to the stables, is a spacious tennis-court, roofed over. Here Her Majesty and the Prince proceeded after breakfast, the Prince amusing himself by trying the sport peculiar to the place. After this, the Prince went out to shoot. Thorpe's Copse, chosen for the scene of the day's recreation, is a cover about two miles from Strathfieldsaye. The beaters mustered in great force, and the shooting party consisted of Prince Albert, the Duke of Bedford, Colonel Bouverie, and Capt. Brown. Lord C. Wellesley and Mr. Anson were present, but did not join in the sport. The party rode to the ground, the Prince and Lord C. Wellesley heading the group of horsemen. After a short stay in Thorpe's Copse, the party abandoned it for the pheasantry close to the Duke's park, behind the rectory of Strathfieldsaye. Although there were only four guns in the party, the game killed numbered 71; of these, 39 were pheasants, 25 hares, and 7 rabbits. The Prince despatched 23 pheasants, 12 hares, and 6 rabbits. The whole time occupied in shooting did not exceed an hour and a half. After luncheon there was a match at tennis, the whole party adjourning to the court. The game was played by Lord C. Wellesley and Mr. Phillips, the tennis-master, against two professional players from Hampton. Her Majesty expressed herself much gratified with the sport, which was conducted with great spirit and vigour. The dinner party included, in addition to the former circle, Lord and Lady Carnarvon, Sir John Cope, and the Speaker of the House of Commons. Sir Claudius and Lady Hunter, Sir Henry and Lady Dukinfield, Mr. and Mrs. Thayts, Mr. Griffiths, and Mr. and Mrs. Porcher formed the evening party. The band of the Grenadier Guards attended, as before, in the conservatory. Her Majesty passed the evening in the library, where the guests were chiefly assembled. On Thursday morning, immediately after breakfast, Her Majesty and the Prince proceeded to the tennis court, where his Royal Highness practised for some time with Lord C. Wellesley, and subsequently with Mr. Phillips. The Prince appeared to enjoy the game exceedingly, and Her Majesty, who was accompanied by the Marchioness of Douro and several ladies of the party, was evidently much amused and interested in the exhibition of skill it afforded. Shortly before 11 o'clock a detachment of the North Hants Yeomanry Cavalry, under the command of the Speaker, Colonel Shaw Lefevre, with band and colours, arrived, and formed on the lawn before the principal entrance to the mansion. Her Majesty almost immediately entered her carriage and took her departure for Windsor, escorted by the Duke of Wellington as far as Swallowfield. No incident worthy of note occurred on the journey, and the Queen arrived at the Castle at ½ past 1, followed by the different members of her suite.

Cabinet Council.—A Council was held on Saturday at the Foreign Office, and was attended by nearly all the Ministers. It sat two hours. Another Council is summoned for this afternoon.

Death of the Earl of St. Germain's.—Lord St. Germain's died on Sunday last, at his seat, Port Eliot, Cornwall, at the age of 78. His lordship was married no less than four times; namely, first, in 1797, to Lady Georgiana Augusta Leveson Gower, fourth daughter of the first Marquis of Stafford, and sister of the late Duke of Sutherland, who died 1808; secondly, in 1809, to Letitia, eldest daughter of the late Sir William A'Court, Bart., and sister of Lord Heytesbury, the present Lord-Lieutenant of Ireland, who died in 1810; thirdly, in 1812, to Charlotte, eldest daughter of the late Lieut.-General Robinson, and granddaughter of the late Earl of Powys, who died in 1813; fourthly, in 1814, to Susan, sixth daughter of the late Sir John Mordaunt, Bart., and aunt of the present baronet, who died in 1830. He is succeeded by his only son, Lord Eliot, Chief Secretary for Ireland, who was born 29th August, 1798, and married, 1824, Lady Jemima Cornwallis, third daughter of the Marquis Cornwallis, by whom he has a family of seven children, his eldest son, Edward, now Lord Eliot, having been born the 2d April, 1827.

Ministerial Changes.—The office of Chief Secretary for Ireland, which will be vacated by the accession of Lord Eliot to the Peerage, as Earl of St. Germain's, will be conferred, it is said, on Mr. Sidney Herbert; and the Hon. L. Corry is mentioned as Mr. Herbert's successor at the Admiralty. In connection with the Admiralty, we may here mention a rumour that Sir John Barrow, Secretary of the Admiralty, will immediatety retire; and that Captain Hamilton, Private Secretary to Lord Haddington, will be his successor.

The Peerage.—The *Gazette* of Tuesday confirms the rumour mentioned by us last week, by announcing the elevation of the Governor-General of Canada to the peerage, by the title of Baron Metcalfe, of Fern Hill, in the county of Berks.

Legal Appointments.—Mr. Baron Gurney, in consequence of continued ill-health and increasing weakness, has sent to the Lord Chancellor his resignation of his office as one of the Barons of the Exchequer, which he has filled for so many years. It is supposed that Mr. Platt, Q.C., will be his successor.—The death of Sir C. Williams, Chief Commissioner of Bankruptcy, has caused a vacancy in that Court. Rumour gives the appointment to Serjeant Atcherley, who has several times gone the circuit for Judges, or to Mr. Whately, the Queen's Counsel; but report adds, that some of the country Commissioners have promises of being advanced to London as vacancies may occur.—Mr. Dyke, the son of Sir P. H. Dyke, has been appointed to the situation of Queen's Proctor, vacant by the death of Mr. Ilted Nichol. The annual average of the present fees of office, on a moderate computation, is 2000*l.*—formerly they were much larger. During the war, when the condemnation of prizes and other proceedings connected with international law, to which the Crown was a party, occupied the Admiralty Court, the fees of the Crown Proctor have been known to amount to between 30,000*l.* and 40,000.

Slave-trade Commission.—Our readers are aware from the debates in the French Chambers last week, that the French and British Governments have resolved on appointing a mixed commission, in order to inquire how far other measures, equally efficacious as the right of search, may be devised for the prevention of the Slave-trade. It is said that the commission will hold its sittings in London, and that the Duke de Broglie will be the French, and Dr. Lushington the English Commissioner.

Foreign.

FRANCE.—The debate on the Address in the Chamber of Peers, of which we gave the commencement in our last, was not concluded until Saturday, when the Address was carried by 114 to 39, giving Ministers a majority of 75. The discussion of the several paragraphs involved numerous questions of great interest to this country. On the second paragraph, relative to the late hostilities with Morocco and the treaty of peace concluded with that empire, a long and animated debate arose, some portions of which must necessarily be noticed by our own Government when Parliament assembles. The Prince de la Moskowa criticised the several articles of the treaty, and concluded as follows:—

"In short, the clauses of the treaty you have concluded are either insignificant or unexcusable. The most woeful consequence of your conduct is that you have paralysed for the future all enterprises that may be necessary for the protection of your possessions, and shall I tell the secret of your conduct?—you have been so moderate solely because you knew that Morocco was protected by England, and you were afraid of giving offence to that Power by exacting more. For this other sacrifice can we hope to obtain some concessions in the right of search question?"

In reply to these attacks M. Guizot entered into a most elaborate vindication of the policy pursued towards Morocco, and was followed by Count de la Redorte, who reiterated several of the charges brought against the Cabinet by Prince de la Moskowa. He said that the Emperor of Morocco derived his audacity from his conviction that France could not act against him without endangering the interests of England. The Emperor knew that she carried on the whole trade of his dominions—that she supplied Gibraltar from them, and that she viewed with envy the French possessions in Africa. Such was the principle of his confidence, and that principle should have been destroyed. On the contrary the commerce of Morocco had been spared during the late operations, and the rights of war had not been exercised. It was evidently from a fear of displeasing England. The Cabinet had, besides, taken its precautions; it had communicated its intentions to England, informed her of the measures that were contemplated, and told her how far they would be carried. Here M. Guizot cried that it was a mistake. M. de la Redorte replied that he himself had stated as much in last session, and that Sir Robert Peel had openly declared it in the House of Commons on the 25th of June. On being called upon to read the English Minister's words, M. de la Redorte said, "Here are Sir R. Peel's expressions; I translate them correctly:—

"Complete and unreserved explanations have given assurance that the object of the expedition was not conquest, that the King's Government had no intention of occupying any part of the territory of Morocco, and that it had communicated the course it intends to pursue towards Morocco, and the demands it has made on that power; it has informed us of the measures it intends to adopt if it should become necessary. It has communicated to us the substance of the instructions issued to Admiral the Prince de Joinville. The English Government places entire confidence in the declaration thus made to it, and is perfectly satisfied with the assurances it has received.'"

M. Guizot observed that no such declaration had been made. M. de la Redorte offered to lay on the table the collection (printed by order of the House of Commons) containing the speech whence he had extracted the above passages, and quoted another one, in which Sir R. Peel replied to Mr. Sheil, that the French Government had "communicated the general substance of the instructions issued to the commanders of its land and sea forces." M. de la Redorte concluded by urging that the dignity of a nation consisted in the maintenance of all its rights and of its complete independence, and that they had not been maintained towards Morocco; that the object aimed at had not been attained, inasmuch as the safety of Algeria had not been secured; that what was necessary to check the enemy, who had hitherto constantly disturbed that possession, had not been done; and throughout the affair the Government had been swayed by the fear of displeasing a people for whom M. Guizot always exhibited so lively a "*susceptibilité.*" M. Guizot again rose, and said:—

"No communication has been made of the description mentioned by M. de la Redorte. None of the instructions given either to the Admiral or the Marshal have been communicated to any Power. None of the rights, none of the means of warfare, have at any moment been abandoned by the King's Government. The King's Government has constantly announced and officially declared that it meant to use all the rights and all the means it might require to attain its end. One thing only has been declared, and it has been publicly declared in both Chambers. It is that France did not intend to make any conquests in Morocco. Such is what it has declared to the British Government, and it declared it after stating it in both Chambers before all Europe; it has added nothing, said nothing more; it is the substance of the instructions issued. It is impossible that Sir Robert Peel's expressions should have another meaning. I repeat it: no other communication has taken place, and I say it most loudly, in order that it may be understood on the other side of the Straits—as well as in this hall—no other communication has been made, and no instructions have been communicated. And as for the employment of all the means of war, and the exercise of all the rights of war, it has not only been maintained, but we also officially declared that we should resort to them if necessary. We informed the British Government of the intention of the King's Government, and declared that we aimed at no conquest, and wished to take possession of no territory. And why should we have refused to declare this to an allied Government, when we had proclaimed it to the face of Europe? Such is all that has been communicated, and nothing more nor less."

M. de la Redorte and Prince de la Moskowa having stated that the Government had not blockaded the coast of Morocco out of deference to this country, the Baron de Mackau, Minister of the Navy, replied to their imputations, and explained with much vivacity why Mogador had been occupied in preference to the other posts, and why that place had been evacuated. He concluded by paying a tribute to the "eminent qualities" the Prince de Joinville had displayed throughout his operations. "Surrounded," said M. de Mackau, "with able captains, distinguished officers, and exercised crews, and having at his disposal magnificent ships, he has, in 35 days, conducted an expedition, concluded peace, and made us triumphant over an enemy who had hitherto been deemed formidable." The debate was then adjourned to the following day, when Viscount de Saint Priest and M. Pelet de la Lozère attacked the treaty as being unworthy of the military and naval achievements which had preceded it, and its stipulations were defended by the Baron de Bussières and the Duc de Broglie. To the latter's vindication of the conduct of the Government the attention of all the journals is directed. The conspicuous part the Duke de Broglie has taken in public affairs, and the high official stations he has held since the revolution of 1830, as well as the great influence he exercises over the Chamber of Peers, impart considerable interest to the support he has afforded to his old friend, M. Guizot.

The Duke vindicated the conduct of the Cabinet in the Morocco affair. He could, he said, conceive the hostility which that treaty had raised, if the object of France, instead of consolidating her power in Algeria, was to extend her possessions—if instead of maintaining an army of occupation of 100,000 men, and expending 100,000,000f. annually, France wished to maintain double that force, and spend 200,000,000f. The accusations directed against the Ministry would be well founded if France had not enough of one Algeria, and was anxious to annex Morocco to her dominions, for in that case she would be obliged to take a footing, and form establishments, in the country. M. de Broglie contended that France had to apprehend being drawn by a deplorable fatality into aggressions against Morocco. A civilised nation could not long live on good terms with its barbarian neighbours. It was a natural consequence of the contact of civilisation with barbarism. Savage tribes constantly afforded their civilised neighbours subjects of complaint and grievance, which would be regarded as real motives of war between civilised countries, and the latter were forcibly led to attack in succession all those tribes, certain beforehand of overcoming them without difficulty. The English, in India, had been placed in a similar position, and in the course of the last hundred years, from possessing only three factories on the coast, she had been compelled to overrun and occupy the entire country. The Ministry, he thought, had in the treaty with Morocco attended to the main point, the security of the Algerian possessions of France, and given an example of forbearance which their successors, whoever they might be, would do well to imitate. The Duke afterwards vindicated M. Guizot and his colleagues against the charge of obeying the dictates of England, and contended that, in the Morocco affair, instead of consulting the convenience and inclinations of the English people, they had had recourse to the mode most calculated to wound the susceptibility of that nation, to whose Government they had declared that they would employ all the means at their disposal to enforce satisfaction from Morocco. He then contrasted the advantages of the English alliance with those afforded by Russia or the other Powers of Europe, and concluded by declaring that, in his opinion, the existence of a good understanding between England and France was [illegible] guarantee of a last[illegible] peace of the world. A [illegible] had

Minister and a Member of Parliament in the House of Commons. This, said the Duke, is not the first time that an English Minister, when speaking to the Opposition, has employed expressions stronger than his thought, and had afterwards to regret it; neither will it be the first time that, in exaggerating the exaggeration itself, an interpretation has been given to words which they did not bear. A good harmony between France and England is, it must be admitted, the condition of the peace of the world; but this does not say that it is necessary to sacrifice to that good harmony our interests or our rights, but which might lead two Governments moved by a reciprocal good will, to make mutual concessions on questions more or less delicate. It is necessary to take into account the difficulties which both Governments have to smooth down, the common efforts which they are making for this object, and the consideration which they are obliged to show towards one another. This is the proper part of a reasonable and sensible policy.

This speech was received with loud applause, and the second paragraph with the three subsequent ones were adopted. The amendment proposed for the purpose of renewing the wish of the Chamber that the negotiations on the right of search might tend to place French commerce under the exclusive surveillance of the national flag, was adopted unanimously, M. Guizot having readily assented to a paragraph which the Deputies inserted in their two last addresses. On the 6th paragraph, relative to the friendly intelligence between France and foreign powers, the Marquis de Boissy obtained an adjournment to Saturday, but the discussion of that day, although given at great length, presents little interest. The amendment referring to Poland was adopted, and, as stated above, the address was finally voted by 114 to 39, a majority much larger than Ministers expected. The Address was formally presented to the King on Sunday, and acknowledged with the usual complimentary speech. —On Friday the President of the Chamber of Deputies read the address of that branch of the Legislature, as drawn up by the Committee. Although three weeks have elapsed since the King's speech was delivered, the address is little more than a paraphrase of it; but its several paragraphs will nevertheless be the ground of much angry discussion. The debate commenced on Monday, and excited an extraordinary degree of interest, as it was felt that upon the result depended, in a great degree, the existence of the Soult-Guizot Cabinet. Five Deputies spoke in this sitting, MM. G. de Beaumont, de Tocqueville, and Marie against the projected address, which is favourable to the Cabinet, and MM. Liadières and Gasparin in favour of it. All these orators expended their eloquence on what is called the "*discussion générale*"—a skirmish which precedes the divisions on the several paragraphs, and of course the ballot which usually decides the fate of the whole Address, and that of the existing Administration if it be in peril. The only speeches which will excite interest in this country, were those of M. de Beaumont and M. de Tocqueville.

M. de Beaumont praised England, and admired its works and force, but strongly advised France not to ally with it; for a close connection with anything so great could only have the effect of making France little. Besides, public opinion in Europe was setting so fast and strong for liberty, that a coalition of absolute governments against France was the most unlikely thing in the world. He knew the English too well not to esteem them; he was too well acquainted with England not to admire her Government and free institutions; he should never forget that she was the first to recognise the Government of July,—but all those considerations did not militate in his mind in favour of a close alliance. Good and friendly relations should be cultivated with her, but that was all; for it was impossible that a cordial alliance could exist between two countries whose interests were at variance not only on one point but all over the globe.

M. de Tocqueville then rose, and said that he could not concur in the opinion that the policy of the Cabinet had been honourable, firm, and successful, when he recollected that it made the alliance of England the cardinal point of its policy. That alliance had been useful and necessary after the Revolution of July, but at present it would have pernicious consequences for the country, and he was sorry to disagree in that respect from two such statesmen as MM. Guizot and Thiers, who were both advocates of that alliance, but viewed it in a different light. War with England, he admitted, would be a very great calamity; he honoured and esteemed the English nation, but the interests of the two countries were so opposed that no intimate alliance could subsist between them; for England could not subscribe to any concession; her existence would be the price of it; if she lost the monopoly of the trade of the world, she must perish. He then contrasted the political position of both countries. France was the head and heart of democracy, and her interests commanded her to propagate as much as possible democratic principles; whilst England was the stronghold of aristocracy, and necessarily entertained widely different sympathies. "Consider, gentlemen," he said, "the singular and unprecedented situation of England—unprecedented for her greatness, and for the perils she is exposed to; consider a nation that has arrived at putting into her hands the whole commerce of the world, and of supplying the whole world with the produce of its industry, and which to live is obliged to maintain so extraordinary a situation. Industry and commerce are not to her what they are to us—sources of wealth and greatness; be not mistaken; they are her very life. Think of what England is in our days; behold, gentlemen, all the activity, all the energy, all the science, all the professions of that great people inclosed, concentrated, accumulated, if I may venture to say it, in the field of industry; behold, the two-thirds of the population engaged solely in those occupations—two workmen to one agriculturist. And this is not all; so large a mass of workmen are concentrated on a small space, forming a people apart, moveable, agitated, and, though it cannot be well explained, hostile to the aristocratic institutions that form the basis of the constitution of the country. There are counties in England where there are nine individual workmen to one agriculturist. Such is the state of England; and do you believe that a nation which is in a position so forced and so contrary to the habitual nature of things will not see in industry and commerce not only the source of its wealth and greatness, but also the guarantee of its existence? It would be a complete error. No, gentlemen, England—and I think it should be ever present to the thoughts of those who treat with her—England requires, in order to live, that all the markets of the world be open; and, to secure the supplying of all those markets, she must be mistress of the seas; she must not only be powerful, she must be all-powerful; she must not only command, she must reign. Such is the real situation of England. Thus, when you ask England to open you a market, even the smallest, she is obliged to deny it. Be as eager towards her as you please, she will refuse. Make all the concessions of *amour-propre* you please, you will obtain nothing. What! you will say, England, that reigns over so many markets, cannot let you have that of Belgium! No, she cannot. What! England, that occupies whole continents in Oceania, cannot let you quietly occupy there two petty islands! No, she cannot. She, that possesses a large portion of Asia, can-she cannot. She, that possesses a large portion of Asia, cannot relinquish to you the inhospitable coast of Africa! No, she cannot; and never will. When, therefore, you demand of England a reciprocity of interests, you demand something that the ablest statesmen of this country have never hoped to obtain; you pursue a chimera; and I could assert, without his having done me the honour of telling me so, that, on this point, the Minister for Foreign Affairs is of my opinion with a nation that requires to be, not powerful, but all-powerful. Intimate and efficient friendship can exist but on the condition of renouncing those things in which it wishes to be and must be all-powerful."

The sitting of Tuesday was opened by M. de Peyramont, who repelled various charges adduced by the Opposition against the policy pursued by the Administration at Madrid, Constantinople, Athens, and at other Courts. Adverting to the "right of search" he justly observed that the treaties of 1831 and 1833 had been executed for ten years together, without their having been suspected to be a source of dishonour to France.

M. Thiers succeeded, and immediately entered into a consideration of the conduct of the Cabinet in the Morocco affair. The success of the war, he admitted, had been brilliant, both on sea and land; it had been inevitable and necessary. He merely objected to the treaty, which offered no serious results. He did not mean that the payment of a few millions should have been stipulated for, but the negotiators should have insisted on some guarantees being conceded which would render it impossible for the Emperor to recommence the war. Any extension of the frontier of Algeria on the side of Morocco would be a great fault; but how was France to punish any new aggression on that side, if she could not seize on any of its provinces? M. Thiers here paid a tribute of praise to Marshal Bugeaud and the Prince de Joinville for the ability of their operations; but the Government, he said, was alone to blame for the sterility of their results, since it had neglected to furnish them with means of doing more. The Marshal had only a handful of men, and was unable to advance upon Fez. The naval means were equally deficient, and the Prince de Joinville had been obliged to evacuate the island of Mogadore for want of provisions and troops indispensable for occupying the town. It was not in consequence of the difficulties offered by the season that the treaty had been so hastily concluded; it was owing to the apprehension of new complications with England. France had made England the judge of her grievances, which the latter had pronounced to be well founded, and it appeared, even by the documents seized after the victory of Isly, that she recommended the Emperor to satisfy them. France was consequently at the time in a favourable condition to obtain an advantageous peace. But then she was engaged in one of the most serious complications with England; the young diplomatist who represented her in London described, in terms of great emotion, the dangers of the position, and insisted on speedy satisfaction being given by France. The Ministry, in their alarm, had then seen the necessity of throwing the heavy baggage overboard, and on the 29th and 30th of August, within an interval of 24 hours, satisfaction was granted to Lord Aberdeen for the treatment of Mr. Pritchard at Tahiti, and directions were forwarded to its negotiators at Cadiz to insist only on the redress of the four grievances which France complained of previous to the commencement of hostilities, and to conclude peace at any price. All these concessions, he maintained, had been made under the impression caused by the complication of Tahiti, and the interests of France in Morocco had been sacrificed to that consideration. M. Thiers then referred to the question of Tahiti, in which he accused Ministers of having blindly compromised the interests of the country. The occupation of a few miserable islands in Oceania was neither necessary to her trade nor to her naval power, and it was a great fault to have ever planted the flag of France in the Marquesas or in the Society Islands. The position of France there was so critical, that she could neither remain in nor evacuate them. M. Thiers then proceeded to vindicate the conduct of Admiral Dupetit Thouars and Messrs. Bruat and D'Aubigny, and disapprove the censure passed on their acts by the Government. The latter alone, who should have been aware of the danger which so injudicious a step would occasion, were to blame. Had the English force stationed at Tahiti been equal to that of France, a collision would certainly have occurred between them, and the Ministry would have been unable to save the peace of the world. It was palpable to any reasoning mind that those barren islands were merely taken possession of to gratify the inordinate overweening vanity of those who wished for a little grandeur, and this upon the shallow pretence that the harbours would be useful for French vessels on their way to China, when it was well known to every seaman that they would not pass within hundreds of miles of these islands. He deprecated the right of search as a means of alliance with England, but the Government had, in a moment of weakness, consented to it, and now they could not get out of it without being guilty of an act of foolish pusillanimity. He concluded by saying—"I define the present policy as at the same time feeble and vain. That is, the former is proved by the fact that you have gone to the farthest ends of the world to seek for compensations for your weaknesses, and this has in its turn become the cause of fresh acts of weakness on your part. It is vain, for when you wanted to establish frank and sincere relations with England, you flung the right of search between the two countries—words in place of things. But what do I say? You have given us things—the Pritchard indemnity, the treaty of Morocco, and the commission on the right of search." (As M. Thiers sat down the Chamber was in a state of great agitation, and the sitting was suspended for some minutes.)

M. Guizot then rose to reply, and in a long and most important speech, of which the following is but a summary, recapitulated all the arguments he adduced in favour of his policy in his reply to Count Molé, in the Chamber of Peers. After declaring that he would pass by the Cabinet of 1840, of which M. Thiers was the head, as having been already judged both by France and Europe, he proceeded to the Morocco treaty, and to the charge of having been precipitate in concluding a treaty of peace.

"It has been said that we did this on account of Tahiti—the assertion is false. Were there not such a place as England in the world—had her interests not been in any way connected with those of Morocco—the simple fact of Algeria being deeply concerned in the matter would have rendered it our duty to arrive promptly at peace. I trust that M. Thiers, after what I have just said, will not reproach us for having paid undue attention to the legitimate interests of England in this circumstance. In regard to Tahiti, the Government never had an idea of possessing itself of it, and putting France and England in contact on that point. All it sought for was a desirable port in those seas. The Admiral sent on that expedition had considered it his duty to assume the protectorate of Tahiti, of which no mention had been made in his instructions. Two reasons determined us not to refuse what the Admiral had done, and the first reason was, that the protectorate of the island of Tahiti was of some importance to our establishment in the Marquesas, and the other that we did not wish to see the French flag withdrawn immediately after its appearance. This protectorate, a protectorate not yet sanctioned by [illegible] ment, continued for 14 months. It had, it is true, had difficulties and embarrassments; but there had not been anything like tumult or sedition, everything went on regularly and peaceably. When, on the contrary, Admiral Dupetit Thouars thought it his duty to convert the protectorate into a sovereignty, disturbances commenced. Thus, during the 14 months of the protectorate Mr. Pritchard, who was then at Tahiti, was unable to excite any [illegible] it was after the assumption of the sovereignty [illegible] to do so. The Government, therefore, were not to blame when, after having accepted the protectorate, they refused the sovereignty. The former appeared to them necessary to protect the interests of France, for which the latter was [illegible] less. I now come to the last incident—that of Mr. Pritchard. You will remember the strong sensation created in England on the receipt of the news of his arrest. This emotion appeared to me to proceed from two causes: first, the quasi-official agent of the English Government with which he was invested; and next, his religious character. The conduct adopted in this matter was this: we first sought to establish the truth of the facts of the case—to prove that Mr. Pritchard was not an official agent, but a simple foreigner, living under the protection of a law common to all. Had he been a Consul, there would have been certain forms to have been observed with regard to him when desiring his expulsion; but he was not a Consul, and the truth of these facts we have been able to prove to the English Government. As to his religious character, we have also established that he has nothing to complain of at our hands; we have proved that the most perfect religious liberty prevailed in Oceania. This done, we remained quiet, in order to allow the angry feeling which had been raised in England to subside. When the proper moment arrived to examine the affair to its foundation, what was the conduct of the Government? We fully maintained the right of the French authorities at Tahiti to expel any foreigner who should disturb public order. After having supported this right, we maintained that our agents at Tahiti had just reasons for using it, and that they had acted properly in so doing. After this we made the admission that some of the conduct used towards Mr. Pritchard was open to blame, and to be regretted; for it could not be admitted that French agents should, in any quarter of the globe, forget those maxims of equity and consistency which were the rule of all regular governments. Our conviction was, that, in the arrest of Mr. Pritchard, some of those maxims had been departed from; and I will explain in what those acts consisted. Without entering into any irritating details, we considered that, although there was enough in the circumstances of the case to warrant the authorities in taking every necessary measure for their safety, yet that it was unnecessary to keep Mr. Pritchard in solitary confinement for eight days, and prevent his seeing even his wife and children. We thought that it was neither just nor proper to use more severity than was really necessary. We considered that the step which had been ordered by the Admiral on his arrival at Tahiti, six days after, should have been done at the time, viz., to compel Mr. Pritchard to leave the island. In saying this I do not mean to shelter the Government behind the Governor of Tahiti, for that would be neither honourable nor just. They had no such intention. M. de Bruat was one of its most intelligent and bravest officers. He every day gave proofs of this. We have admitted that there were certain points connected with this affair for which it was honourable in us to express our regrets and our disapprobation, and we, at the same time, thought that there might exist reasons why a pecuniary indemnity should be granted. The Chamber sees that I do not avoid any point connected with the question. Independently of the rules of which I have spoken, there is a fact of which I will remind the Chamber. Some years before this affair, two French Catholic missionaries had been expelled from Tahiti. Those missionaries had gone to that island under a Government which forbad any preaching contrary to the established religion of the State. The will of Queen Pomare is the charter of that country. The missionaries who went to preach at Tahiti acted at variance with that law, and it was in virtue of it that they were expelled from the island. We had, it is true, been used towards them, but two years after Admiral Depetit Thouars had demanded and received an indemnity of 2500 piastres for the treatment they had experienced. The Admiral was perfectly right in what he did, but it served as a precedent for the French granting an indemnity to Mr. Pritchard. At the same time, however, that we agreed to this indemnity, it was expressly stipulated that it was not given on account of his expulsion, but merely in consequence of the harsh treatment to which he had been subjected. It would be weakness in Ministers to deny that they were glad that this indemnity had been the means of removing the clouds which had hung over the relations with England, but they should, at the same time, have granted an indemnity had no political considerations been connected with the affair. This, Gentlemen, is what I have to say on the *ensemble* of the question. At a future time I shall enter more into details. I will now say a word as to the conduct of the English Government with regard to the affair of Morocco. It made known to us how far its interests might be involved in it; it strengthened its force in that station, but at the same time kept it below our own, to make it apparent that it only sought to protect the legitimate interests of the country. This done, it entered into our combinations, and both at Tangiers and elsewhere represented those demands as to be just, and our demands moderate; it did more, it rendered to us its good offices. In fine, the English Government acted in a situation which was difficult and delicate for it—that of being present and watching our success, and it had the good feeling to wait to see what we considered it just and proper to ask. We well knew what were the feelings of England on the subject, but she demanded nothing of us. Do you imagine that if affairs had been directed in another spirit, they would have taken the turn they have done? One word will serve to enlighten the Chamber on this point. I will quote a few words from a letter from Lord Aberdeen to the English Ambassador at Paris—'My conviction is,' writes the British Minister on the occasion, 'that the sincere desire of the two Governments to maintain the best and most cordial understanding, renders it almost impossible that incidents of this nature, if they are viewed dispassionately, and treated in a spirit of justice and moderation, can ever lead to anything but an amicable and happy issue.' After this quotation, M. Guizot said, "There are now, in France and in England, two Governments which believe that there is room enough in the world for the prosperity and security of both countries; which believe that they are not to regret, deplore, and fear the progress of each other, and that they can, in displaying their forces of every description, freely and with entire independence assist instead of combating one another. There are two Governments which believe this, and which, believing that they can do it, think it their duty to do it, and that it is due to the honour and welfare of their country, and to the peace and civilisation of the world. And these two Governments, thinking that they can and ought to do it, sincerely do it; they evince on all occasions respect for their mutual rights, a reciprocal regard for their interests, and a reciprocal confidence in their intentions and their words. Such is their conduct, and such is the reason that the gravest and most serious incidents do not end in a rupture, or even a coolness, between the two countries. I come to my conclusion, to the result, not the imaginary, but the conspicuous, palpable, and material result of the facts I have enumerated, and the conduct we have held. This result is evident to the whole world. The King of the French has been to Windsor. We have been [illegible] but in another place, that it was for the sake of [illegible] we had hastened the settlement of the differences [illegible] between England and us. This is false. We have [illegible]

nothing, and have sacrificed nothing to the King's journey. The questions have been treated by themselves, solved for themselves, with entire independence. When they were solved, when difficult and unpleasant circumstances no longer existed between the two countries, the King went to Windsor. The propriety of the visit can surely be contested by none; nor should its political utility be any more denied. Although the personal intercourse of princes has not, in our days, the same degree of importance and necessity it may have had in other times, and under a different form of government, it, nevertheless, has great influence over the good relations of states and the easy settlement of affairs. There was the visit of great and real utility. Its results you have beheld: you have seen the striking manifestation of the dispositions and feelings of the Queen of England, and of her government and people, for the King and for the dynasty of July, for France herself, her station, and the part she plays in the world, and for our policy of peace and liberal conservatism. You have seen all that, and Europe has seen it. Do you think that such a spectacle has not yielded us any fruit? Do you think that France has therein, as is alleged, weakened and lowered herself? Put the question to any one you please in Europe, and I beforehand accept the answer. Well, then, what Europe has seen, what Europe has understood, France herself has understood. I witnessed the King's return to France; I witnessed the reception given him everywhere; I saw everywhere a just pride manifested at the homages he had received for France and himself in England; I saw everywhere just satisfaction manifested for the adjustment of the differences that had arisen between the two states, and for the consolidation of peace. I shall add but a few words on a question which will, I suppose, revert again in the course of this debate. I shall not inquire into the origin of the right of search; thequestion existed; it was by itself a very arduous one, and, certainly, what would have facilitated its arrangement had not been done for the last three or four years. I do not say that it is now fully solved; do not fancy that I extend my words beyond the reality of facts; I had rather keep much within it. If I now said more than there really is, I should injure the question instead of serving it. What has been done is this: The British Government is in presence of a national feeling with which it must treat as we treat with that of France. Now, the general opinion in England is, that the right of search is the most efficient, perhaps the only efficient, means of repressing the Slave trade. You know with what passion—with what noble and honourable passion—the abolition of the Slave-trade is prosecuted in that country. Well then place yourselves in that situation. The Slave-trade must be destroyed, and the right of search is the most efficacious means of repressing it; such is, at this hour, the prevailing opinion in England. I believe she is mistaken; but still I say that it is the opinion of the nation. In order that the English Government may change what exists it must acknowledge, make the Parliament acknowledge, and make the country acknowledge by the medium of the Parliament, that there are other means than the right of search of repressing the Slave-trade, means as or more efficacious; for in the present state of facts and of the public mind, the right of search has evidently lost much of its efficiency. The first and perhaps the greatest step to take was therefore to determine the English Government to seek, in concert with us, other means of repressing the trade, to ascertain that the right of search was not the only means, and that it had in a great measure become inefficient. It is this step that has been taken; it has been taken seriously, and not as just alleged, to elude the question, and to deceive with false appearances. It is on the contrary to commence a serious examination and solution of the question, and the names of the persons who will co-operate in it will be the best proof of the gravity with which the two Governments will proceed. Such, gentlemen, is the state of the questions that divided the two countries. Such are the solutions they have received, the spirit in which those solutions have been effected and the first impressions they have made on France; such is the prompt, natural, and spontaneous opinion she formed of them when she heard of those solutions, and of the King's visit to England. Gentlemen, the distance is great between the high and real region, and the inferior and confused arena of pretensions, agitation, party struggles, coteries, and persons, through which we have been dragged for a month past." M. Guizot then exhorted the Chamber to disdain the latter petty interests and consider solely the great interests of the country, and he sat down amidst the cheers of the central benches.

The debate was immediately adjourned to Wednesday, when M. Dupin, after a speech from M. Bechard, attacked the Ministry on the questions of Morocco, Tahiti, and the right of search, maintaining that in none had the dignity of France been preserved. M. Dupin

Hoped that the Chamber would grant no compensation to Mr. Pritchard, that they would not even hear of it, and that if any were paid, Ministers would find it in some other quarter. Regarding the right of search, he derided the institution of a mixed commission for contriving other means of repressing the Slave-trade; the result would be that France would be called upon either to abolish slavery in her colonies, or to maintain the right of search; and as the finances would not admit of the former measure, the treaties of 1831 and 1833 must be maintained. He therefore considered the formation of the said commission, not as a "*grand pas*," as M. Guizot boasted, but as a "*faux pas*." He would therefore ask whether the Chamber could pass the paragraph of the address relative to this question? He wished for peace, but would not have everything conceded to one ally, and nothing to the other. *Chacun pour soi, chacun chez soi.* Such was his motto. He preferred it to the English alliance, if they must pay the price she sets upon it; and he should vote for any amendment to this effect.

At the close of this speech, the general discussion was closed, and the Chamber proceeded to the consideration of the separate paragraphs. The first trial of strength took place on an amendment moved to the first paragraph, which raised the question of confidence and affected the whole policy of Ministers. The result of the division reached London yesterday, from which it appears that there were for the amendment, 197; against it, 225 majority for Ministers, 28.

SPAIN.—We have accounts from Madrid to the 15th inst., but they are not of much interest. In the Chamber of Deputies, on the 11th, the debate on the Bill for the maintenance of the clergy was resumed. In the course of it M. Egana attacked the Minister of Finances with considerable violence, censuring his administration, asserting that 12,000 national estates had been rapidly sold since his accession to the Cabinet, and insinuating that he had derived sundry profits from the sales. M. Mon repelled these imputations with great indignation, and compelled his accuser to enter into explanations which ended favourably to the Minister. In the Senate the discussion on the Constitutional Reform Bill was revived, and General Narvaez delivered a speech in reply to M. Nocedal, who had begged leave to bestow a few "tears" on the Constitution of 1837, since he was sure that the Bill was about to pass. The journals publish the manifesto of the Deputies who have resigned their seats with the Marquis de Viluma. It is signed by 19 of them, and although of immense length, it is by no means of proportionate interest. The seceding Deputies reiterate the grievances they have already urged in the Cortes on the subject of the provisional situation in which the Ministry intend to place the clergy; they also complain with extreme rancour of the outrage they have been publicly subjected to by M. Mon, and of the Chamber of Deputies having been contented with that Minister's explanations. In the Chamber on the 14th, the Bill for the dotation of the clergy was still under discussion. An amendment to raise the funds necessary for the support of the clergy, by a tax upon all property of 4 per cent., was rejected by a majority of 93 to 29. It was reported that the Baron de Meer had refused to accept the office of President of the Supreme Court of War and Marine, and that he had also declined the titles and honours offered to him, believing that his removal from Barcelona was intended as a disgrace. The Government, it is said, were not prepared for this second refusal on the part of the Baron, but have nevertheless appointed Gen. Concha Captain-General of Catalonia. The Queen-Mother communicated on the 15th to the members of the Committee on the Estimates the fact of her marriage with M. Munoz.—The accounts received from Morocco through Gibraltar are of a most deplorable nature. Anarchy is said to reign in a great part of the empire. The Kabyles have pillaged several towns. The peace concluded with France had contributed to weaken the authority of the Emperor Abderahman, who has been represented to the fanatics as incapable of defending the cause of Islamism on the field of battle. It is believed that Abd-el-Kader is not unconnected with the movement.—The *Castellano* mentions the capture, in the Magrat waters, of a Dutch vessel, carrying eighteen caissons of muskets, which were to have been introduced into Spain. The Dutchman is said to have been taken to Barcelona. The same paper announces that upwards of 80 inhabitants of the valleys of Hecho and Anso, who had taken part in the recent revolt and emigrated to France, had claimed the benefit of the royal amnesty, and returned to their families.—The Minister of Foreign Affairs had transmitted to the Consul of Spain in London the decision of the Queen, in virtue of which the Spanish Government has subscribed towards the establishment in the Thames of a floating hospital, for the seamen of all nations who should fall sick during the stay of their vessels in London.

PORTUGAL.—We have accounts from Lisbon to the 15th inst. The Chambers were opened on the 2d by commission, the Queen being unable to attend, from her present delicate situation. The new Peers took their seats in the upper chamber. The former Presidents and Vice-Presidents were appointed in the Deputies: in the Peers, the Duke de Palmella and Senhor Silva Carvalho, were substituted by the Counts Villa Reale and Laborim. An act for the regulation of the Peerage, with some new qualifications for members of the chamber, hereditary, and for life, has been introduced by Ministers, and is likely to be carried.—The total exports of wine from Oporto in 1844 amounted to 33,946 pipes, of which 25,328 were for Great Britain. Gen. Zurbano had arrived in Lisbon. An experiment similar to Mr. Macready's on a foreign audience, had been tried by an Irish singer, Mr. Donaldson, on the Portuguese public, and had led to a theatrical *fracas*, in which the practice was had recourse to, of pelting an obnoxious actor. On this occasion the missiles were not confined to oranges—potatoes were employed, but the actor was fortunate enough to escape without the loss of an eye. Some of his assailants rather imprudently essayed their prowess on the foreigners in the house, and met with their desert at the hands of a Frenchman, and of the English, Irish, and Scotch, who were present. This affair is said to have been occasioned, not by any dislike of Mr. Donaldson, who had never appeared before on the Lisbon stage, but solely by the antipathy of the Portuguese to everything connected with this country.—One of the most interesting monuments of antiquity in Portugal, the convent of Nossa Senhora da Pena, well known to all travellers, and made known to English readers by Byron's description of Cintra's "variegated maze of mount and glen," and "horrid crags by topping convent crowned," has recently suffered considerable injury. The spire was struck by lightning, and much damage done to the lately repaired clock, turret, and adjacent parts of this ancient structure. For several years past, reparations and alterations have been carried on, on a very extensive scale, at the cost and under the direction of the King. The convent, though small in size, is especially remarkable for its cloisters, and the beauty of the miniature in architecture of that part of a monastic building. It is, perhaps, to be regretted, that the restoration of the whole and the preservation of the original character of the outward structure, at least, were not determined on, instead of the idea of giving it a castellated appearance, that is, neither Gothic nor Saracenic. A great deal, however, that is useful and ornamental has been done, and vast expense gone to, to prevent one of the most interesting of the monastic monuments of Portugal from going to ruin, and all the merit of its preservation belongs to His Majesty the King Ferdinand. A carriage-road has been made from the town of Cintra, at the base of the mountain, to the summit (640 yards above the level of the sea), on which this convent stands. The extensive lines and works of the adjoining Moorish fortification have been cleared and walled all round the remains of the old fortress. A small mosque has been discovered, and some Moorish remains have been found close to the remarkable Moorish cistern, or bath, of which Murphy has given a drawing in his work.

SWITZERLAND.—Accounts from Switzerland say that several cantons are in open warfare. At Argovie the insurgents, after having taken the arsenal without any resistance being offered on the part of the Government, seized on the ammunition and other stores, which were there collected in large quantities, and marched towards Lucerne, where they were to meet the insurgents of the other cantons. The canton of Berne was taking measures to refuse a passage to persons coming from Friburg to join the other malcontents at Lucerne. We learn from Zurich that the Swiss Vorort has resolved to convoke an extraordinary Federal Diet for the end of January. The *Cologne Gazette* states that the religious disputes in Switzerland have produced a great sensation in Germany, and the more so, as some of the cantons have persisted in the introduction of the Jesuits, after having consulted the Austrian Cabinet, and received advice very contrary to the course that they have taken.

RUSSIA.—It is now ascertained beyond the possibility of a doubt that the report of the death of the Emperor of Russia was an unfounded one. It is also certain that letters announcing the presumed event were received in Brussels, Antwerp, Amsterdam, and Berlin; and it was announced by the papers in the following brief but confident terms: "La mort de l'Empereur Nicholas nous arrive à l'instant. Elle est certaine."—The following letter from St. Petersburg, dated the 8th, and published in the *France*, shows that the report of the illness, both of the Emperor and Empress of Russia, was without foundation: "Last Saturday the Emperor held a grand review of the garrison. The troops were drawn up in the square of the Admiralty. His Majesty was on horseback, accompanied by the Hereditary Grand Duke Alexander and a numerous suite. The Emperor wore a general's uniform. The troops were two hours in defiling before him. On the 6th, the festival of Christmas, according to the Russian calendar, was celebrated. A high mass in music was performed in the chapel of the Imperial Palace. The Emperor, the Empress, and all their family were present, in deep mourning. It is the day on which, in all the churches of Russia, a public prayer is offered up, thanking God for having repulsed the invasion of 1812. After the mass there was a grand reception in the outer palace of the civil and military authorities and the nobility. The Duke de Leuchtenburg is expected here the day after to-morrow, to be present with all the court at the celebration of the Russian new year."

TURKEY AND SYRIA.—Letters from Constantinople of the 31st state that a conference took place at the Porte on the 28th inst., between Sir Stratford Canning and the Minister of Foreign Affairs, which is now known to have been of very serious import. The outstanding claims of the British creditors of the Porte were enumerated at full length, and it was demonstrated to the Reis Effendi that their payment could not, with the least colour of justice, admit of any further delay; which, it was moreover intimated, would be productive of consequences no less painful to Her Majesty's Government to contemplate than detrimental to the dignity and best interests of the Porte. No further steps had been taken by the European Ambassadors relative to the Trebizond affair. Some Turkish trading vessels had arrived at Constantinople, from the coast of Circassia, bringing some important intelligence from that quarter. The Tartars and Cossacks inhabiting the right bank of the Cuban are represente to be in a state of insurrection against the Russian Government since the withdrawal of the regular troops which formed the garrisons of those provinces, which had been draughted into the army employed against Schamyl in Daghestan.—From the Danube we learn that the investigations, in consequence of the late insurrection in Servia, are prosecuted with extreme rigour, as if it were resolved completely to exterminate the friends of the Obrenowitsch family. On the 23d Dec., Stojan Stojanowitsch, the last and principal support of the ex-Prince, and formerly Secretary to the Prince Milosch, was shot near Schabaiz, in the presence of Mitroviz, after having first asked the favour to get drunk. His corpse was bound to the wheel on the bank. The bodies of ten or twelve other conspirators were fastened to the wheel all along the Servian bank, and seemed intended to mock at the interest lately manifested on the Austrian side for the family of Obrenowitsch.

WEST INDIES.—The mail-steamer Medway, arrived at Southampton, brings papers from Trinidad to Dec. the 18th; St. Kitt's and Demerara to the 21st; Domiica, Barbadoes, and St. Vincent's, to the 22d; Jamaica to the 24th; and from St. Lucia to the 27th. The papers are singularly barren of intelligence. The fever has been very bad amongst the civilians at Jamaica, and was still raging when the Medway left. The military, generally speaking, had escaped, and the whole of the troops were healthy. The weather had been extremely hot. The House of Assembly have voted, though by small majorities of one and two, reductions in the salaries of public officers, on account of the decrease in the price of provisions. The novel ceremony of a convocation of the clergy took place at Spanish Town on the 12th Dec. The cathedral was crowded with spectators. The Governor-General, the Judges, the Speaker, and many members of the Assembly were present, with the Hebrew Rabbi, and many other gentlemen of that persuasion. On the Bishop's entering, the chanting began; and the Liturgy was read. The Bishop then ascended the pulpit, and delivered an address to the clergy, strongly exhorting them against all diversities of opinion, and recommending a spirit of unity among themselves, as being essential to the vigour

and prosperity of a National Church. The Bishop then adverted to the important ceremony of baptism, commenting on its inseparability from regeneration, as explained in the Church Catechism, and concluded with an earnest charge that they would look to the welfare of the children, and thus be enabled to guide their flocks to that rest which is from above.—The Demerara papers announce the death of Sir Michael M'Turk on the 17th Nov. Upon this subject the *Record* remarks:—"The deceased Baronet was distinguished at different periods; in 1824, as foremost in the prosecution of the martyred Smith, of Le Resouvenir—in 1834, as the proposer of the Bill for the termination of the apprenticeship system of slavery (for which step he received the approbation of the Sovereign and the title he held); and since that period, as the steady friend of the people in the Legislative Hall, and as maintaining a friendly feeling towards the successor of the martyred missionary, whose station was on one of Sir Michael's estates, not far from Le Reseuvenir."—By an arrival from St. Domingo, we learn that the Spanish part of the island has been organised into a republic separate from the other, as "the Republic of Dominica." Its independence has been recognised by the Haytien Government. Commissioners from Dominica have been sent to the United States to seek a recognition of their independence, and negotiate a commercial treaty with the United States. This division is supposed to be a final separation between the Spanish and French negroes of Hayti.

CITY.

Money Market, Friday.—Consols closed at 100¼; Reduced Three per Cents., 100¾; New Three and a Quarter per Cents., 104⅛; Bank Stock, 214; India Stock, 286; Exchequer Bills, 60 to 62 prem.

GAZETTE OF THE WEEK—BANKRUPTS—G. JACKSON, jun., Hartford, upholsterer—H. C. STUBLA, Seymour street, Euston-square, glass dealer—W. E. SCHOTTLAENDER, Poplar row, New Kent-road, merchant—J. WARD, Ely, Cambridgeshire, dealer in glass—T. B. and J. WALLER, Ipswich, grocers—H. and W. KIMBER, Old Trinity House, Water-lane, wine merchants—E. J. CHAPMAN, Bradford, Yorkshire, and Birkenhead, Cheshire, civil engineer—J. BULLOUGH, Huddersfield, cabinet maker—G. H. LUPTON, Leeds, flax spinner—T. FRANCIS, Selby, Yorkshire, linen draper—N. J. KEMPE, Liverpool, shipowner—J. G SCHOTT, Manchester, and J. C. LAVATER Aldermanbury Postern, merchants—W. DETTMER, Upper Marylebone-street, pianoforte manufacturer—H. ISAACS, Yarmouth, Norfolk, woollen draper—G. HAWKINS, Colchester, Essex, clothier—L. WATLING, Gilbert-street, Hanover-square, butcher—S. SHARPUS, Sibbertoft, Northamptonshire, and West Smithfield, cattle salesman—J. EVANS, Bourton on the-Hill, innkeeper.

Metropolis and its Vicinity.

The Weather.—At an early hour on Monday morning a fall of snow took place in the metropolis; the wind the previous night had been at W.S.W., accompanied with heavy rain, but towards the morning it suddenly veered round to N.E., blowing a perfect hurricane, and the rain turned to snow, which lay only a short time on the ground. In the afternoon the weather moderated and a frost took place at night. It is apprehended that considerable damage has been done, particularly at sea.

Arrival of Chinese Ransom.—A special train arrived at Nine Elms, from Gosport, last week, conveying the last portion of the Chinese ransom of 21 millions brought from Hong-Kong, by H.M.S. Pelican and Harlequin. The train consisted of five waggons and two carriages; the former contained the boxes holding the Sycee silver, each waggon carrying about 3½ tons. A gentleman from the Treasury, and a detachment of the 59th regiment, accompanied the treasure from Gosport. In the course of the afternoon the treasure was conveyed in nine waggons to the Mint.

The Marylebone Vestry.—On Saturday, in consequence of the intended discussion on the confirmation of the resolution affecting the character of the Rev. Dr. Penfold, the rector of Trinity Church, the most numerous meeting of the vestry ever known to have assembled took place at the Court-house. The Rev. Dr. Spry, the rector of the parish, took the chair, and out of 120 (the number of gentlemen who constitute the vestry) there were no fewer than 110 members present during the proceedings. The Rev. Dr. Penfold attended, and entered at great length into an explanation of the matter. It appeared from this that the donor of the money in question had, as far back as April 1843, sent to Dr. Penfold by post a remittance of 11*l.*, which he designated as "the amount of his tithe for the first quarter of 1843." This quarterly payment has been made ever since, and latterly has increased. It has sometimes been sent to Dr. Penfold's house, and sometimes been put into the plate in church, in which case Mr. Tritton, the rector's churchwarden, has reserved it for Dr. Penfold. One of the first points to be ascertained was the intention of the donor when he contributed the 25*l.* which was the subject of the present inquiry. This was done at once by Dr. Penfold, who knew the name and address of the party, and on being applied to, the donor immediately settled the question by writing a letter to Dr. Penfold, which was read to the meeting, the name however being withheld. The donor stated that he thought it right to devote the tenth part of his income to the service of the church, and had for that purpose sent the sums quarterly to Dr. Penfold. He had no intention of giving it to the charity school on whose behalf the sermon was preached, and his belief when he put the money in the plate, with the inscription "for general purposes," was that it would be disposed of by Dr. Penfold, at his discretion. In consequence of the mistake which had occurred, the donor added that he should henceforth adopt a different mode of payment. This point having been settled by the letter of the donor, several members of the vestry expressed themselves satisfied with the statement, as an exculpation of Dr. Penfold, but there was another point to be decided, whether it was legal to apply money placed in the plate at a charity collection to any other purpose than the support of that charity. A letter was read containing the opinion of Dr. Phillimore, in favour of the course adopted by Dr. Penfold, but as several members contended that the money belonged to the charity, and advised that the question be again referred to the Bishop of London, Sir Peter Laurie suggested as a conciliatory course that the money should go to the charity, and that Dr. Penfold should urge the liberal donor not again to adopt a plan which had led to so much misapprehension. Dr. Penfold immediately said, amidst great cheering, that he would act upon the suggestion, and left the board for the purpose of seeing the gentleman who subscribed the money, and prevailing upon him to allow the contribution to be applied to the funds of the charity. The debate on the question was then adjourned to the next meeting of the vestry.

Repeal of the Malt Tax.—A meeting of the London and Central Committee, including some of the most influential gentlemen and agriculturists from all parts of the country, took place on Monday, pursuant to adjournment, at the Farmers' Club-house, Bridge-street, Blackfriars, for the purpose of taking into consideration the most efficient measures to be adopted in order to obtain an immediate and total repeal of the duty on malt. Mr. Fisher Hobbs, of Essex, was unanimously called on to preside. The secretary submitted to the committee several communications from local committees established in various parts of the kingdom, expressive of their views on the subject, and their cordial co-operation with the central committee in London. The counties of Bedford and Northampton were particularly warm in the cause, and in the latter county nearly 200 gentlemen and farmers had united and formed a committee, with the intent of canvassing the several parishes and districts of the shire. It was then determined that a form of petition should be adopted, and transmitted to the several district committees of the kingdom for signature. In order to give weight to the petitions, it was recommended that the number of acres occupied by each party who signed them should be added.

National Testimonial to Mr. Rowland Hill.—The following correspondence has been published on the subject of the Testimonial to Mr. Hill, as the author of the Penny Postage: "Sir,—The city of London Mercantile Committee on Postage have great satisfaction in forwarding to you a copy of resolutions passed by them, in March last, accompanied by a cheque for 10,000*l.*, part of the amount raised in carrying out the object therein referred to. The committee reserve till a future opportunity the pleasure of making a more public presentation of the fruits of their labours, as in many parts of the kingdom the efforts of their friends are yet incomplete, and as they hope to add considerably to the amount already subscribed by continuing their exertions.—I am, Sir, your obedient servant, GEORGE LARPENT, Chairman.—3, Moorgate-street, London, Jan. 21, 1845."—Mr. Hill replied as follows:—"Sir,—I have the honour to acknowledge the receipt of your letter of this day's date, inclosing a copy of resolutions passed by the City of London Mercantile Committee on Postage in March last, together with a cheque for 10,000*l.* As the committee intimate their intention at some future period of making a public presentation of the fruits of their labours, I would respectfully request permission to defer till such time all attempt to express my obligations to themselves (my fellow-labourers in the cause of Post-office improvement), and the feelings of pride and gratitude with which I accept so splendid a proof of the sympathy and approbation of my countrymen.—I have the honour to be, Sir, your most obedient humble servant, ROWLAND HILL.—London, January 21, 1845."

The Mormonites.—This singular sect, of American origin, have installed themselves in Theobald's-road, where, on Sunday evening, "Elder E. H. Davis," styling himself companion and intimate friend of the late martyr Joseph Smith, delivered the first of a course of lectures on their particular views and opinions. The audience was numerous, and many were provided with the peculiar prayer-books of the sect. The preacher took his text from Matthew, 20th chap. and 4th verse, from which he argued that the promises of Scripture had not been fulfilled until these latter days; to this church, however, had now been restored the gifts of tongues, prophecy, healing, and inspiration, and it was in possession of apostles, prophets, evangelists, and pastors, the same as in the days of old. The preacher strongly urged upon his audience the claims of adult baptism as a sign of their admission into the latter-day church.

New Church in Camden-Town.—It is intended to erect a new church in the Camden-town district of St. Pancras, the population of which is 16,000, with church accommodation for only 1600. For this purpose a plot of ground has been given, free of all costs, by the Marquis Camden and the Rev. Thomas Randolph. In addition to this gift, the Marquis has subscribed 500*l.* towards the erection of the church, and the Rev. T. Randolph a like sum. The Bishop of London has signified his approval of the plan, and the works will commence when the necessary arrangements can be made.

The Late Suicide at Bermondsey.—An inquest has been held on the body of John Clements, whose attempt to murder his wife and subsequent suicide was noticed in our last. The evidence clearly proved that the man was of unsound mind, and the jury returned a verdict accordingly. The wife is in Guy's Hospital, and will, no doubt, recover from her injuries.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Jan. 18: West Districts, 146; Northern, 208; Central, 181; Eastern, 208; Southern, 267; Total, 1010; males, 489; females, 521. Weekly average for the last five years, 963. Births in the week, 1331; males, 669; females, 662.

Provincial.

Bedford.—On Saturday a public meeting, consisting of upwards of 200 agriculturists and others interested in the repeal of the malt tax, was held in this town, Mr. F. Pym in the chair, at which resolutions condemning the tax "as oppressive and injurious to the growers of barley, impolitic in its principle, tending to cripple native industry, and occasioning great privation among the humbler classes," and stating that "by the repeal of the tax farmers would be enabled to use their inferior barleys in the shape of malt for feeding stock, and that thus the large sums now annually sent abroad for linseed and cake might be reserved at home," were passed, and a committee appointed to draw up petitions to Parliament for the repeal of the tax.

Bridgewater.—The inquiry into the recent cases of poisoning at Shapwick is still the chief topic of interest in this neighbourhood. After a verdict of wilful murder had been returned against the prisoner, Sarah Freeman, for the murder of her brother, the jury investigated the circumstances of her mother's death. It was clearly proved that she also died of the effects of arsenic, but the evidence failed to bring it home directly to the prisoner. Two other cases, however, remained, those of the husband, Henry Freeman, and the illegitimate child. The inquests on their bodies concluded late on Friday night, the jury returning in both cases verdicts of wilful murder against the prisoner. At the conclusion of these inquests, the Coroner made the following remarks to the jury:—"Gentlemen, I am afraid I shall have further occasion for your services. I have received a letter from highly-respectable persons, the statements made in which are very alarming—namely, that five other deaths have occurred in the parish very recently, and all of them of one family. It is also stated to me in that letter, and I do not know how far it may be true, that Sarah Freeman was in the constant habit of visiting that house."

Bury St. Edmund's.—On Saturday the whole of the Judges, excepting Mr. Baron Gurney, who has been some time indisposed, assembled in the Court of Exchequer to consider the reserved points on the trial of William and Walter Howell, and Israel Shipley, who were sentenced to death, at Bury St. Edmund's, for the murder of James M'Fadden, a policeman, by shooting him with a gun. After hearing Mr. Prendergast at great length, in behalf of the convicts, their Lordships came to the unanimous decision that the sentence of death must be confirmed.

Denbigh.—We learn by the local papers that Mr. Thackeray, as usual, has employed the labourers on his estates at Nerquis and Llanarmon, in this county, at this season of the year, when work is scarce, by planting most extensively. He has now in course of transplanting upwards of 25,000 young oaks, varying in height from 2 to 7 ft. "The Doctor," says the *Chester Chronicle*, "is going fairly to work to earn another medal, in addition to those he has already had awarded to him."

Exeter.—The riotous scene which followed the conclusion of Mr. Courtenay's sermon, at St. Sidwell's, on Sunday week, was repeated last Sunday. Mr. Courtenay persisted in preaching in his surplice, both morning and afternoon, and was on both occasions mobbed by several hundred persons on his return home. In the morning there was a strong muster of police, and as they took down the names of the hissing parties, the mob was somewhat deterred; but in the afternoon the heavy rain and dusk served to conceal the rioters, and no less than 2000 persons followed Mr. Courtenay through the streets, yelling and shouting vociferously. Mr. Courtenay was escorted by the police, and a large body of friends, so that he was not exposed to any personal violence. In the evening, Mr. Courtenay's pulpit was occupied by Dr. Coleridge, a cousin of the Bishop of Barbadoes, and of Mr. Justice Coleridge, and a leading tractarian of the neighbourhood. When he ascended the pulpit in his surplice, the people were exceedingly indignant, and there was a general rush to the door, full half the congregation leaving. As soon as he saw them departing, he cried out, that it was no use their going out—it was no use their holding meetings, or petitioning the Queen—they could not do anything at all; they must do as the Church wished. He then went on with the sermon. At the close of the service an indignant mob awaited his appearance in the street. His phaeton drew up at the front door, but Dr. Coleridge slipped out of a side door into a lane adjoining the church. His carriage drove off to the London Inn Square, whither most of the people hastened, in order to intercept him. There he was received with the fiercest cries of indignation, and it was not without difficulty that he ascended the vehicle. During the whole night the city was in such a state of ferment, that the troops were kept in readiness to act at a moment's notice. On Monday morning the magistrates had a secret meeting to deliberate on the extraordinary state of affairs, and John Harris, Esq., one of their body, wrote to the Bishop, to tell him that there would be bloodshed if it continued. One of the persons who had been seen hissing on the preceding day, was then brought before the Mayor. His name is Tarrant, a hair-dresser, and he was charged with having committed a riot and breach of the peace. After hearing both sides the Mayor said, that the authorities, whatever might be the cause of the unhappy dissensions in the Church, were resolved to suppress [illegible] in the

streets, but, as this was the first case, they would treat it leniently and dismiss the prisoner with a reprimand, hoping that it would act as a caution to his fellow-citizens. During the hearing of this case, a memorial to the Mayor, praying him, as the head civil functionary of the city, and charged with the preservation of the peace within it, to write to the Bishop, calling on his Lordship to use his authority to set aside the cause of these disturbances, was handed round and signed by great numbers of gentlemen. Another clergyman, the Rector of St. Stephen's, has refused to abandon the use of the surplice, or to restore the Church services to their former state; and the parishioners at a meeting, on Saturday, the Churchwarden in the chair, unanimously resolved to call upon him to resign his living.

Isle of Man.—About this time last year the college in the Isle of Man was destroyed by fire. It appears that through the liberality of its friends in England, the college at the beginning of the year was in such a state of forwardness, that on the 2d inst. the Principal, with his family and boarders, took possession of the renovated building. Great improvements have been made in the internal arrangements, among which may be mentioned its subdivision into seven fire-proof compartments. The chapel is expected to be ready for Divine service by Easter.

Leamington.—The Hon. Wm. Leigh, son of Lord Leigh, came of age on Friday last, when the event was celebrated with great festivities at the abbey. Lord Leigh received on the occasion an address from a deputation from the inhabitants of Leamington. Large quantities of wearing apparel were distributed by Lord and Lady Leigh to 560 poor people from the surrounding villages, and in the evening his Lordship gave a banquet and ball, which was attended by nearly all the nobility and gentry of the county. A similar entertainment was given by his Lordship on Saturday to his tenantry, including their wives and families.

Liverpool.—On Saturday week Mr. Charles Hancock, a farmer, residing at Heswell, about eight or nine miles from Woodside, was in Liverpool, disposing of some market produce. He returned by the Birkenhead boat about 5 o'clock; and in passing across Bidston Common, in his shandry, he was met by a person in female apparel, who begged him to allow her to ride as far as Woodchurch in the vehicle. Mr. Hancock acceded to her request, but had scarcely driven on again before he discovered, to his amazement, that his female companion, as he supposed, exhibited a dark bushy whisker upon that side of her face which was exposed nearest to his view. Immediately he dropped his whip, as if by accident, and requested the *lady* to step down and pick it up. The stranger got out, and Mr. Hancock drove off at such rapid speed, that, on entering his farm-yard, the horse dropped down dead. When he had driven about a quarter of a mile from the place where he had dropped his whip, two pistols were fired at him, both of which fortunately missed. In the gig the stranger left a basket, which, on examination, was found to contain a large carving-knife and a brace of loaded pistols.

Manchester.—On Monday a young man, named Evan Prince, whose connections reside at Mold, and are respectable tradesmen, was brought before the magistrate, charged with having embezzled the large sum of 3500*l.* from his employer, Mr. Percival, woollen draper, of King-street, in this town. The discovery was made by the superintendent of police, who detected the prisoner by making purchases with marked money. On being searched 8*l.* was found upon his person, 150*l.* in his lodgings, 500*l.* at his father's, with banking books containing a sta ement of deposits exceeding 2670*l.* made by the prisoner at the North and South Wales Bank, Mold; the Royal Bank of Liverpool, Messrs. Devon and Wardle's, and Messrs. Granvilles, at Chester; a mortgage deed and a promissory note for 70*l.* The prisoner declined saying anything in his defence, and was committed for trial. It appears that Mr. Percival was not in the habit of taking stock, and had little suspicion of what was going on.

Oxford.—It is said that the Authorities of Oxford have recently consulted their legal advisers on the proposed new test and proceedings against the Rev. Mr. Ward, and that Mr. Bethel and Mr. Fitzroy Kelly have given their opinion against the legality as well of the test as of the proposed measure of which Mr. Ward is the object. The test, it is said, it has already been determined to abandon; but with respect to Mr. Ward no resolution has yet been adopted.

Uxbridge.—Last week a case of poisoning occurred in this town, which has excited very great interest throughout the surrounding neighbourhood. The person upon whom the attempt was made is a young female, 22 years of age, named Elizabeth Dickman, the wife of a journeyman baker residing in that town, and her child, an infant six months old. Dickman and his wife were married 12 months last October, and almost from that time have been continually quarrelling. For some time the man has been out of work. On the night of Tuesday week he did not come home until after his wife was in bed, and on the following morning he got up before her and said he should enlist for a soldier. Before, however, he left the house, his wife heard him moving about in the adjoining room, and making a noise, as if moving some crockery. She afterwards got up and made her breakfast, when she observed that the milk instantly became curdled. It did not, however, deter her from drinking the contents, which produced a heat in her throat and pain in her stomach, by which she was convinced that her husband had mixed something with the milk, for the purpose of poisoning her and her infant. She immediately took the sugar-basin to a chemist, and stated her suspicions, when he declared it to be mixed with oxalic acid. Information was immediately given to the police, who caused an active search to be made for the husband, who had absconded. Strong remedies were in the meantime administered to the wife, by which means she recovered. On Wednesday the husband, who is not 20 years of age, was apprehended, and after being examined before the magistrates was committed to Newgate for trial.—The investigation into the circumstances of the Ruislip murder, which we noticed a fortnight since, has ended in the committal of the accused person. This man, whose name is Lamb, is now a prisoner in the House of Correction for poaching, and a fellow prisoner deposed to several particulars which he had heard from the man himself. After several inquiries the magistrates found that these details were confirmed by other witnesses, and committed Lamb to the Central Criminal Court to take his trial.

Windsor.—A very important document connected with the endowment of the ancient Order of Poor Knights of Windsor has recently been discovered among the archives of the Court of Wards and Liveries, which promises to become the subject of legal controversy, as it involves the right of the Poor Knights to the distribution among them of a large and hitherto unappropriated income. The document in question is a verified copy (signed by Cecil, Lord Burleigh) of the charter, under the sign-manual of Queen Elizabeth, instituting the above order, and bears date the 20th August, 1558. The following is extracted from the indenture prefixed thereto:—"And whereas divers manors, lands, tenements, and hereditaments mentioned and contained in the schedule hereunto annexed, of the clear yearly value of 600*l.* and above, are given and assigned unto the dean and canons of Windsor, and their successors, to and for the intent and purpose that all and singular the premises, the revenue, and profits of the same shall for ever be employed and bestowed in the maintenance and support of thirteen poor knights within our Castle of Windsor, in such manner and form as in a book hereunto annexed, and signed with our sign manual, is set forth and declared." Following this is a covenant, on the part of the dean and canons, "to employ the rents, revenues, and profits of the same in such manner and form as is therein set forth and appointed." The charter then goes on to state that the annual sum of 231*l.* 6*s.* 8*d.*, shall be applied out of the same towards paying the vicar's and serving-priest's wages, officers' fees, and in the repairing of the lands. The book annexed to the indenture contains a description of the services to be performed, a schedule of the lands, and an account of the privileges to be enjoyed by the knights. The present value of the endowment is upwards of 11,000*l.* per annum, although the stipend hitherto paid to the knights has never exceeded 40*l.* a year. Until the discovery of this document, which appears to confirm the right of the knights to the full appropriation of the endowment of their order, it was concluded that the charter of Elizabeth, and all copies thereof, were in the possession of the dean and canons of Windsor, and no access thereto has ever been permitted to the knights. The opinion of counsel has been taken on the subject, which is stated to be favourable to the knights, and proceedings will be immediately instituted to recover their rights. The schedule of the lands is interesting, as showing their value in the time of Elizabeth. The following are some of the principal extracts from the charter, with the annual rentals annexed:—"Cornwall—St. German's Parsonage, 48*l.* Devon—Plympton St. Mary's, 46*l.*; Plymstock Chapel, 41*l.*; Bradwynch Rectory, 36*l.*; Wimburn Chapel, 30*l.*; Iple Penn Rectory, 30*l.*; Southmoulton Rectory, 45*l.*; Ottery St. Mary's, 37*l.*; Islington, 16*l.* Wiltshire—Ambroseshire Parsonage, 23*l.* 13*s.* 4*d.*; Prebend Tithes of Bedwynde, 56*l.*; Stapelford Parsonage, 18*l.* Carmarthen—Abbergwille Rectory, 20*l.* Brecknock—Talgarthen and Mawe, 35*l.* Middlesex—Isleworth and Twickenham, 26*l.* 13*s.* 4*d.* London—Blossoms Inn, 16*l.*" &c. &c.; forming a total of 661*l.* 6*s.* 8*d.* The copy of the charter is deposited in the Record-office, and remains in an excellent state of preservation. It is engrossed on vellum, and, amongst other attractions, not forgetting the autograph of the celebrated Cecil, is a likeness of the royal founder of the order of the Poor Knights, which is ascribed to Holbein.

York.—William Potter, who was convicted at the late assizes of arson, at Wistow, near Selby, and sentenced to be executed, has received Her Majesty's pardon for the capital offence, and is to be transported for life.

Railways.

The following are the returns for the past week:—Birmingham and Gloucester, 2184*l.*; Bristol and Gloucester, 1005*l.*; Eastern Counties, 3673*l.*; Edinburgh and Glasgow, 2133*l.*; Great Western, 12,799*l.*; Grand Junction, 6851*l.*; Glasgow, Paisley, and Ayr, 1328*l.*; Great North of England, 1430*l.*; London and Birmingham, 13,749*l.*; South Western, 4618*l.*; Blackwall, 707*l.*; Brighton, 2828*l.*; Croydon, 360*l.*; Liverpool and Manchester, 4305*l.*; Manchester, Leeds, and Hull, 5958*l.*; Midland 8784*l.*; Manchester and Birmingham, 3088*l.*; Newcastle and Carlisle, 1536*l.*; Newcastle and Darlington, 985*l.*; Sheffield and Manchester, 658*l.*; Yarmouth and Norwich, 197*l.*; York and North Midland, with Leeds and Selby, 1907*l.*—The Board of Trade gave notice in the *Gazette* of Friday that, having had under consideration the following scheme for extending railway communication in the district of North Kent and in the district of Kent and Sussex, intermediate between the South-Eastern and Brighton railways, viz.—The Central Kent Railway; London and Croydon (Orpington branch); London and Maidstone; London and Ashford; London, Chatham, and Chilham; London, Chatham, and Gravesend; London, Chatham, and North Kent; Rye, Tenterden, and Headcorn; South-Eastern, (Maidstone and Rochester); South-Eastern, (Tunbridge to Hastings, Rye, and St. Leonard's); South-Eastern, (branches to Deal and Walmer, and extension and deviation at Margate); South-Eastern, (Ashford to Hastings); South-Eastern, (Headcorn to Rye); South-Eastern, (Hungerford-bridge to Tunbridge and Paddock-wood and branches); South-Eastern, (North Kent, Hungerford-bridge, to Chilham, with a branch to Sheerness, and branch to connect Greenwich and Woolwich); they have decided on reporting to Parliament in *favour* of the South-Eastern, (Maidstone and Rochester); South-Eastern, (branches to Deal and Walmer, and extension and deviation to Margate); South-Eastern, (Ashford to Hastings); South-Eastern, (Hungerford-bridge to Tunbridge and Paddock-wood and branches); South-Eastern, (North Kent, Hungerford-bridge to Chilham, with branch to Sheerness, subject to any modifications which may appear to be desirable for the Naval and Military establishments of the country; and reserving consideration of the branch to connect the Greenwich and Woolwich); and *against* the Central Kent, London and Croydon (Orpington branch), London and Maidstone, London and Ashford, London, Chatham, and Chilham; London, Chatham, and Gravesend; London, Chatham, and North Kent; Rye, Tenterden, and Headcorn; South Eastern (Tunbridge to Hastings, Rye, and St. Leonard's, with the exception of so much of the line as lies between Tunbridge and Tunbridge-wells); South Eastern (Headcorn and Rye). It appears from this announcement that, as the Board in their two former notifications were in favour of the Great Western and South Western Companies, so they have in the present case decided in favour of the South Eastern line, confirming the impression that their policy throughout will be conservative of existing interests.—The *Gazette* of last night contains another notice, announcing that the Board have decided in *favour* of the Newcastle and Berwick, with branch to Kelso; the Bury and Ipswich; Ipswich and Norwich Extension; Lynn and Ely; and against the other schemes proposed in Norfolk and Suffolk, the particulars of which will be given in our next. The Board have also decided in *favour* of the following Irish railways:—Belfast and Ballymena; Dublin and Belfast Junction, with branch to Drogheda and Kells; Dublin and Drogheda—Howth Branch; Ulster Extension—Portadown to Armagh; Dundalk and Enniskillen (except the Monaghan branch); Newry and Enniskillen (except that portion between Newry and Armagh.)—The half-yearly meeting of the Midland Counties Company took place on Monday at Derby. The report stated, that there was a balance sufficient for a dividend of 3*l.* per cent. on the consolidated stock, 3*l.* per cent. on the preference stock, and 2*l.* 6*s.* 3*d.* on the Birmingham and Derby stock. The increase in the receipts of the three companies had amounted to 42,078*l.* during the last half-year. There had been a decrease in the expenditure of the locomotive department of 3341*l.*; of 1740*l.* in the coaching and goods department; of 485*l.* in the office charges; of 200*l.* in the direction; 174*l.* in the stores department; and of 2613*l.* in the amount paid for interest. It was with deep pain that the directors referred to the late accident which had occurred on the Nottingham line. That distressing event had caused them the deepest anxiety and concern. They had, however, done all in their power to alleviate the afflictions of the parties who had principally suffered. The directors felt convinced that the accident had been caused by one of those errors of judgment which were ever to be deplored. With respect to the mineral traffic on their line the directors expected a considerable increase, and they had in consequence ordered 250 additional waggons, which would shortly be ready, and they would then be enabled better to provide for this branch of their trade. The directors of the London and Birmingham Company had agreed to a mileage rate on goods passing to and from this railway, and great advantage was anticipated from this arrangement. The London and Birmingham had commenced carrying coals on the whole length of their line. This would open up a large traffic, and the directors had in consequence given orders for more engines of increased power. The new railways and branches which had been proposed by this company had been advanced on the principle of giving the best railway accommodation to towns at present not enjoying the advantage. The directors relied with confidence on the justice of the Board of Trade, and they believed that these lines would ultimately receive the sanction of Parliament. The report concluded by stating that the expenses of this half year had only been 26 per cent. on the receipts. The Chairman, Mr. Hudson, then addressed the meeting on the various topics noticed in the report, and detailed the new lines which the company purposed to construct. The Syston and Peterborough line was 47¼ miles, and the capital required would be 700,000*l.* It would reduce the cost of coal 50 per cent. in the district, and could not, he believed, be successfully opposed. The line from Nottingham to Lincoln would be 34 miles, cost 12,000*l.* a mile, and require a capital of 400,000*l.* Both lines had exceedingly good gradients. Then there was a short line of 3-8ths of a mile, to effect a junction between the Sheffield and Rotherham and Manchester and Rotherham, which would cost 36,000*l.* Then, there were branches from Darfield to Masbrough, and from Darfield to Elsecar, which would cost [illegible]

posed line from Swinton, *viâ* Doncaster, Gainsborough, Lincoln, Boston, Spalding, to Wisbech was 124 miles in length, and would join the Eastern Counties at March. It would cost 1,612,000*l.*, at 14,000*l.* a mile; by means of it they would be enabled to travel quicker than by the line proposed by the Manchester and Leeds company. They had then a branch from Swinton to Wakefield, and on to Sheffield and Rotherham, and by this line a distance of 40 miles was saved as compared with the London and York line. After entering into an examination of the merits of the proposed London and York line, which he contended would never receive the sanction of the legislature; the Chairman concluded by moving the adoption of the report, which was carried with applause.

Ireland.

Dublin.—Mr. O'Connell has addressed a letter to Archbishop Crolly in which he retracts at once, and unequivocally, any assertion of his that may apply, or seem to apply, to the document published by the Primate, as being uncanonical:—

Mr. O'CONNELL says,—"I freely avow that the document given by your Grace to the public is perfectly canonical; and, even if my private opinion had been otherwise, I would at once yield it to the authority with which that document is now clothed. I, however, never did intend to express the idea that such a document as that really in question could be uncanonical. If you permit me to refer to my letter you will find that I acted from misinformation, which made me conceive that the document treated of 'matters of a temporal nature, or matters relating to the political rights and liberties of the Irish people.' Such a document would plainly be uncanonical, and directly repugnant to our oaths, abjuring all power and authority in the see of Rome in matters purely temporal. Before the appearance of your Grace's letter there was, naturally, great excitement in the public mind. The distinct avowal in the *Morning Chronicle* that the Whigs, when in office, had a politico-religious agent in Rome—the shout of triumph which emanated from the Tory press on the completion of the commission under the Bequests Act, containing a similar avowal of an agent from the present Government in Rome—these, combined with many sinister reports—confirmed, as they appeared to be, by a letter published in the *Globe*,—filled the public mind with just alarm. The *Globe* letter affected to quiet our fears. It admitted, however, that a Mr. Aubin had an agency from the Ministry in Rome. It affected to consider that agency as confined to some proceedings of a temporal nature in the Roman States; but, that business being over, Aubin still continued to reside at Rome, though, according to the *Globe* letter, he had nothing to do there. What is sufficiently curious is, that the *Globe* proceeds to state that Aubin had been preceded by Mr. Seymour, the actual ambassador at Florence. Aubin supplied the place of Seymour; and the *Globe* tells us, that on the death of Aubin, Petre was appointed to the situation. This is called "an anomalous position;" but Petre, besides being in an anomalous position at Rome, is still *attaché* to the English Minister at Florence. It is stated, that his salary is very trivial, "not exceeding that of a paid *attaché*." He has, then, a salary, and is at Rome—doing what? It is not said—and it would be laughed at if it were said, that the affairs of the English Catholics require any such agency at Rome. It is plain his agency can only relate to Ireland. Now these, your Grace perceives, are all admissions of an underhand agency by the Court of England at Rome. At such a period, and with these facts staring us in the face, it is natural that much alarm should exist; and I, with profound deference, and without any species of flattery, respectfully state that your Grace has shown great wisdom in producing to the public the actual, and, as I understand, the only document received from Rome, and in taking the trouble of repeating the pledge which the Irish Prelacy have given, to use every influence in their power to prevent any such insidious scheme as the concordat, "which (I use your Grace's words) would be destructive of the purity and independence of our holy religion."

A new club, called the '82 Club, has just been formed in Dublin, the object of which is to facilitate the Repeal of the Union, to secure the establishment of the legislative independence of Ireland, and as a means for the attainment of these ends, to encourage Irish manufactures, art, and literature, and to diffuse through society a national feeling. The club is to dine together on the anniversary of the declaration of legislative independence in 1782, and the members are to wear a uniform. Mr. O'Connell is the President, Lord Ffrench, Messrs. S. O'Brien, Grattan, Roche, and M'Loughlin, Vice-Presidents.—The weekly meeting of the Repeal Association took place on Monday, Mr. Smith O'Brien, M.P., in the chair. The proceedings were opened by a speech from Mr. John O'Connell, who adverted to his long absence from their meetings. He said that he had not been idle in the mean time, but making great preparation for a new campaign of agitation. As one of the judges appointed to decide on the best Essay on Repeal, he was gratified to say that the compositions sent in amounted to 55 volumes. This was a sure token of the interest felt in the question, and of the expanding intellect of Ireland. Repeal must succeed; nothing could prevent it. The English press exercised a most bigoted and virulent influence against them, but it would be of no avail. (At this moment Mr. O'Connell entered the hall, followed by Mr. O'Neil Daunt, and the most vehement shouting immediately ensued, which lasted for several minutes.) Mr. J. O'Connell resumed by an attack on the Whigs, and said they proved the hostility of England to Ireland. Were the Irish then to wait for the English mind towards Ireland to change? They might as well wait for the rivers to reverse their course. The Irish would trust the English no more. Wars, however, might come, and then England would change her line from insolence or indifference, to one of abject fear or craven deprecation. He did not doubt in the least of their ultimate success, for they would rely upon themselves and persevere in their struggle. Mr. O'Connell now handed in some subscriptions, amongst others one from the Right Rev. Dr. M'Nally, Roman Catholic Bishop of Clogher, who said in a letter which accompanied it, that the letter of the Cardinal Prefect, just published by the Primate, proved "that our revilers, in furtherance of their insidious assaults on our religious characters, have had the daring effrontery to insult the meek venerable head of the Catholic Church, by charging the Apostolic See itself with *encouraging or conniving at* the political intemperance imputed to some ecclesiastics in this country, on statements unfounded, perhaps, or grossly exaggerated, and which, if true, would be a subject of the deepest affliction, not only to the Holy Father, but to the whole body of the prelates, clergy, and Catholic people of Ireland." Mr. Burke, of the county Galway, read a letter from the Rev. Mr. O'Malley, his parish priest, denying the canonicity of the rescript of Cardinal Franzoni. The writer said that the Roman Pontiff could not chain them down; that if he attempted it they would give him his "*quietus.*" All the sentiments contained in this epistle, which were decidedly anti-papal, were warmly applauded. Rev. Mr. Hopkins was understood to contend that the letter alluded to was a canonical document. Mr. O'Connell rose to order. He said both the Rev. Mr. O'Malley and the rev. gentleman whom he had taken the liberty to interrupt, had equally a right to their own opinions, but it was clear that that Association was not the proper place for giving expression to them. Rev. Mr. Hopkins admitted the propriety of the remark that had fallen from Mr. O'Connell, but he could not remain quiet while he heard such a doctrine as that put forth in the letter which had been read, without expressing his disapprobation of it. The Chairman begged to remind the reverend gentleman that there was then no question before the meeting. Mr. Steele handed in some subscriptions which he had collected whilst on his tour. He said that in Leitrim he had organised such a "moral staff" as would not fail to secure the peace of that county. He had passed through Cavan and Monaghan on his return home, and he pronounced them to be perfectly tranquil. In Dundalk there were some ribbon tendencies, but they had been successfully repressed by a number of volunteer peace preservers. Mr. O'Connell reprobated the ribbon confederacy, and pronounced it to be the greatest hindrance to the Repeal combination. He next adverted to the representation of Tipperary. He lamented that Mr. Hutchinson would not accept of it. Mr. Albert Fitzgerald was substituted for him; he was his particular friend, and a most worthy and talented gentleman. Mr. O'Connell then commenced his speech for the day.

He said he was only now *commencing* his agitation. Nothing would satisfy them but Repeal. Nothing had terrified them. The monster meetings spoke emphatically the sentiments of the Irish people—all Ireland was in favour of Repeal. One year was spent in chicanery; but there was no surrender and no compromise. They are now commencing afresh. Oh, how delightful to struggle for the liberty of our native land! It were worth being alive to be engaged in such a pursuit. Repeal would put an end to feud and faction—all religious ascendancy. We are struggling that the press, education, religion, Ireland, should be free. It would be base to shrink, as the chairman had emphatically said. But Ireland would be true to herself, and true to him, and *he* should be the very first member returned for the Irish Parliament. There is no doubt of our success. If Great Britain indeed was to be *always* so prosperous, so tranquil, they might despair; but her troubles would come, and then our price is—Repeal. The Irish were not apathetic on the subject. It was a foul falsehood. Their meeting proved that it was so. Mr. O'Connell here introduced his history of the Act of Union, which on this occasion he continued down to the death of Lord Castlereagh. He then adverted to the deficiency of the representation of Ireland—of the Irish measure of municipal reform, absenteeism, &c. It was vain, he said, to hope that the Irish would give up Repeal; but the English were now seeking to divide them. He did not doubt that the Queen's speech at the opening of Parliament would be full of fair words towards Ireland; but these were all hypocritical pretences. The Minister would give them plenty of promises, but there would be no performance. As to the Irish members, he would not consent to their going over to attend Parliament; it would be quite useless, or worse, as it only afforded delight to the minister to run down poor Paddy. He might venture to assert that the Bequests Act would be matter for consideration, and in that event their presence would be indispensably necessary. It has been said that the dissension arising from the discussion of that measure had tended in a great degree to damp the agitation for Repeal. He regretted to say that there was some truth in that statement. He had been told that a rescript had come from Rome prohibiting the Repeal agitation. He admitted the rescript, but denied the prohibition. The prelate who seconded the motion for receiving the rescript had sent in his subscription that day to the Association, and the prelate who moved the resolution attended a Repeal dinner in Limerick a few days after. The resolution sent by Dr. Crolly to him as having been adopted by the bishops, was merely that they would carry out the spirit of the rescript, which was to the effect that every exertion should be made to keep up and promote the spirit of benevolence and charity. The rescript, therefore, should be put out of the question. It had nothing to do with the laity or with Repeal. He recommended the Catholic laity of Ireland to call upon the bishops who had taken office under the Bequests Bill to unite in addresses to those prelates, calling upon them to yield so far to their flocks as to resign those offices, and to return amongst them, and he was sure that such a course would be followed by the most beneficial results. A single word of intemperance would destroy all hope of so desirable a termination, and he trusted such would not be indulged in at any of the future meetings of the laity. Hundreds of these meetings had been already held, and hundreds more would follow, and it was remarkable that not a single lay meeting had as yet taken place in favour of the bill. There was not even an instance of any layman standing up at any one of the meetings that had been held to advocate the bill. It had been denied that there was any concordat thought of, and he was ready to believe that denial. But he would fearlessly assert that something more injurious was meditated. Let it be recollected that the English had an agent at Rome, and that the rescript which had lately appeared was obtained under the most suspicious circumstances. Every one was aware that the Pope had no control, or ought to have none, over their temporal affairs. He would recommend to the Irish people the absolute necessity of sending two delegates to Rome, for the purpose of laying a statement of their case before his Holiness, and to implore of him not to thwart them in their peaceable exertions (in common with their Protestant fellow-countrymen) to obtain a restoration of their domestic legislature. He would take it on himself to name two individuals, who, he was sure, would undertake the arduous and responsible office. Lord Ffrench, he felt confident, would be ready to proceed, and he would name his son John O'Connell as his companion. After some remarks on the physical superiority of the Irish, he said he would implore of the people to rally with him for the Repeal, which would restore Ireland to that position which Heaven designed her to occupy. His first speech had been against a continuance of the Union, and his latest efforts should be directed to the same end. After a few further observations, he concluded by moving that it be referred to the committee to report what conduct the Repeal members ought to pursue with regard to their attendance in Parliament.

After the disposal of some routine business, Mr. O'Connell announced the repeal rent for the week to be 3*l.* 3*s.* 5*d.*—The agitation against the Bequests Act continues in all parts of the country. Last week a large meeting of Roman Catholic clergymen of the archdiocese of Dublin was held, when a petition to the Legislature was adopted, urging the total repeal of the Charitable Bequests Act, and also the repeal of the penal clauses in the Emancipation Act, affecting the Jesuits and other orders of the regular clergy. The meetings in the provinces are so numerous that it would be useless to attempt a description of them. The following resolution, agreed to at a meeting held in Dundalk on Sunday week, and presided over by the Very Rev. Mr. Coyne, Vicar-General of Armagh, appears to embody the spirit which animates the democratic section of the Roman Catholic laity and priesthood:—"Resolved that whilst as Catholics, we are determined to respect with scrupulous fidelity of submission the legitimate authority of the Holy See in all spiritual matters, we are equally resolved as loyal subjects and Irishmen, to repudiate and resist any and every attempt of the Pope, or of any foreign potentate whatever, to intermeddle in the political concerns of this kingdom." A meeting has also been held at Coltra, in the county of Galway, at which Lord Ffrench presided, and resolutions violently opposed to the Act and to the Catholic prelates who are commissioners under it were adopted.

BIRTHS.—On the 17th inst., at the Vicarage, Latton, the lady of the Rev. H. W. BEADON, of a son—19th inst., at Tamar-terrace, Stoke, Devonport, the lady of R. TOWNSHEND, Esq., of a daughter—20th inst., at Putney, the lady of A. BARTTELOT, Esq., of a son, still-born.

MARRIAGES.—On the 12th ult., at St. George's Church, Basseterre, St. Christopher's, R. M. RUMSEY, Esq., Colonial Secretary, to LOUISA F. RAWLINS, third daughter of the late Hon. William Wharton Rawlins, Member of Her Majesty's Council in that Island.

DEATHS.—On the 17th inst., at Richmond-hill, the Dowager Lady MORSHEAD, aged 87—On Sunday morning, at his seat, Port Eliot, St. Germains, Cornwall, the Right Hon. the EARL OF ST. GERMAINS, aged 78—16th inst., at his seat, Belmaduthy-house, Ross-shire, Sir COLIN MACKENZIE, Bart., aged 63—19th inst., in Hans-place, Sloane-street, Lieut.-Col. C. R. KENNETT, late of the Hon. East India Company's Bengal Service—19th inst., at Brighton, the infant son of LADY A. BARING—20th inst., in Hyde Park-square, CATHERINE ANNE GRENFELL, wife of Pascoe St. Leger Grenfell, Esq., aged 49—22d inst., at the house of the Hon. Mr. Justice Wightman, at Hampton, F. W. BAIRD, second son of Henry John Baird, Esq., Receiver-General of Berbice, aged 17—16th Sept., at Rome, the Princess D. CZARTORISKA, relict of the late Prince Joseph Czartoriska.

WANTED IMMEDIATELY, a Quantity of TWO-YEAR TRANSPLANTED THORNS. Any Parties who can supply the above, and will send an offer stating number and place of delivery, will please address, F. C. BALL, Nurseryman, Taunton.—Jan. 25.

WANTED, a WORKING GARDENER, who thoroughly understands the business. A good character will be required.—Apply to A. B., Post Office, Fareham, Hants.

WANTED, a GARDENER.—A married Man, understanding the Pruning, &c. of Vines and Wall Fruit Trees, and the complete routine of a Kitchen Garden.—Wages, 15*s.* per week, and a small cottage and garden. None need apply who cannot give most respectable references.—Address, post paid, to X. Y. Z., Spilsby, Lincolnshire.

WANTED, a PROPAGATOR, in an Establishment where a General Collection is cultivated.—Apply by letter, post paid, stating terms, references, &c., to THOMAS JACKSON, Nurseryman, Kingston, Surrey.

WANT PLACES.—All Letters to be post-paid.

AS PROPAGATOR, or PROPAGATOR and FOREMAN.—A Man who can produce unexceptionable testimonials as to ability, &c.—Direct to A. B., care of Mr. Clark, Seedsman, Bishopsgate-street Within, London.

AS GARDENER.—A single Man, aged 29, who perfectly understands the cultivation of Pines, the early forcing of Grapes, Strawberries, Cucumbers, Melons, &c., also with good practical experience in both Kitchen and Flower Garden. Character unexceptionable.—Direct to A. B., Mr. Henry Unwin, Leyton, Essex.

AS GARDENER.—An active, married Man, without incumbrance, aged 38, of respectable habits, and well experienced in all the superior branches of his profession, including Early Forcing of all kinds, Flower, and Kitchen Garden. No single-handed place accepted.—Direct to A. B., Post-office, Hays, Kent.

AS GARDENER.—A young Man, who has had first-rate instruction. Any Nobleman or Gentleman wanting a person in that capacity will find him worthy their attention; an unexceptionable character will be given.—Direct to Mr. M'INTOSH, Dalkeith Palace; Mr. M'INTOSH, Drumlanrig Castle; or Mr. TURRELL, Royal Gardens, Hampton Court—(this is inserted without his knowledge).

AS GARDENER.—A young Man, aged 25, who has a thorough knowledge of Gardening in all its various branches. Six years' most satisfactory reference as to character, &c. can be given.—Direct to J. R. W., Post-office, Wolverhampton, Staffordshire.

AS GARDENER.—A middle-aged man, without incumbrance, of sober and industrious habits, who has had extensive practice, and has a thorough knowledge of his profession in all its branches. The most satisfactory reference as to character, ability, &c. will be given.—Direct to J. F., Bromley Hill Gardens, Kent.

AS GARDENER.—A single, active Man, aged 30, who understands the Greenhouse and Hothouse, and can take charge of Meadow Land. Can have two years' good character from his last situation. Wages, 22*s.* per week; or, in the house, 30*l.* per annum, with lodging. Direct to J. B., Worledge's Newspaper Office, 2, Church-street, Hackney.

TO SEEDSMEN AND OTHERS.

AS CLERK, SALESMAN, and ASSISTANT in a SEED WAREHOUSE.—A steady, respectable young Man, who has a good knowledge of the Seed and Plant Trade, &c., and can have an excellent character from the house he has lately left.—Direct to S. M., at the Office of this Paper, 5, Charles-street, Covent-garden, London.

The Newspaper.

SATURDAY, FEBRUARY 1, 1845.

BRITISH MUTUAL LIFE ASSURANCE SOCIETY, 17, NEW BRIDGE-STREET, BLACKFRIARS.

The British Mutual Life Assurance Society rejects the system of giving Bonuses at short periods, as contrary to the provident principles of Life Assurance, and adopts the lowest rates which the value of life can afford—thus giving to the Assured a sum annually, equal to bonuses every 2, 3, 4, and 5 years. The adjustment of the rates in the British Mutual to the several ages of life is worthy of attention, at middle life being between 20 and 25 per cent. lower than in most Offices, and at advanced life maintaining a favourable comparison with any, and gives the advantage of the *Tontine* to survivors of more than average life.

Prospectuses and every information may be obtained on application at the Office, 17, New Bridge-street, Blackfriars.

CHARLES JAMES THICKE, Resident Secretary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, WATERLOO PLACE, PALL MALL, LONDON.

The Chisholm, *Chairman*. W. Morley, Esq., *Dep. Chairman*.

GREAT ADVANTAGES OFFERED TO POLICY-HOLDERS BY THIS INSTITUTION.

A large and immediate accession of Assurances, by the transfer of the Policies of the "Achilles British and Foreign Life Assurance Association."

PROFITS.

The whole of the Profits divided ANNUALLY among the Members, after payment of five Annual Premiums.

An ample guaranteed Capital, in addition to the Fund continually accumulating from Premiums *fully sufficient* to afford complete security.

CREDIT.

Credit given to Members for half the amount of the first five Annual Premiums, without security.

Credit allowed to Members for the whole of the first five Annual Premiums, on satisfactory security being given for their payment.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Members.

Loans granted upon approved Security.

An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying up the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.

Extract from the Reduced Scale of Rates, for an Assurance of 100*l*.

Full particulars are detailed in the Prospectus.

A. R. IRVINE, Managing Director.

News of the Week.

THE Majority of 28, by which the French Ministry defeated the first amendment in the Chamber of Deputies, has not been followed by corresponding successes. It is true that the Ministry obtained on Friday the rejection of another amendment, the object of which was to censure them for their conduct of the Morocco war, and especially for the treaty with which their negotiations were concluded: but this success was of short duration, and was attributable chiefly to the speech of Marshal Bugeaud, Governor-General of Algeria, who expressed his satisfaction with the treaty, and his conviction that nothing more could have been done by the troops at such a season. The affairs of Tahiti and the indemnity to Mr. Pritchard were not so favourably received, and the debate upon these points ended in the most serious check which M. Guizot's Cabinet has yet sustained. An amendment was moved to the Ministerial paragraph, expressing the regret of the Chamber that in conceding a reparation which was not due, sufficient regard was not had to the principles of justice and reciprocity. This amendment afforded an opportunity for the expression of those angry feelings on the subject of the indemnity which appear to be general throughout France. The Opposition made it the ground of a combined attack upon the Cabinet, and Mr. Pritchard's conduct at Tahiti was the subject of severe animadversion from both parties. M. Guizot defended his policy in regard to Mr. Pritchard at great length. He asserted the right of the French authorities to expel Mr. Pritchard, but at the same time disapproved the conduct of the Governor in punishing him by imprisonment. For that injury the Government had considered it just to award an indemnity, as the best means of compromising their difficulties; for the proceedings of the French agents had placed the Cabinet between the alternative of a compromise or a rupture. The concession, however, was by no means confined to France; the English Government, said M. Guizot, had taken into consideration the remonstrances of France on the inconvenience of continuing Mr. Pritchard at Tahiti, and had given satisfaction by recalling him at the moment when he was expelled. This defence, although placing Mr. Pritchard's removal in a new light, failed to satisfy the Chamber; and when the division took place, it was considered doubtful whether the amendment was negatived or carried. The Chamber then proceeded to a division on the paragraph, and after another stormy discussion, a ballot took place which gave Ministers a majority of only 8. This result is said to have taken the Ministry by surprise, and the Chamber broke up in the utmost confusion; the Opposition leaders declaring that the Cabinet was extinct, and that no further struggle was necessary to overthrow it. The Opposition therefore either retired or offered no further resistance to the remaining paragraphs, which were passed as a matter of course. The whole address was then put to the vote and carried by a majority of 183, this large and apparently irreconcilable majority being caused by the absence of nearly all the Opposition Deputies, whilst the Ministerialists maintained their position to the last. As soon as the result of the Tahiti paragraph was known, it was generally believed throughout Paris that Ministers would resign. Marshal Soult, it is said, proceeded to the Tuileries, to take the King's commands; but His Majesty would not break up the Cabinet, and recommended that they should at once elicit the real intention of the Chamber by trying the effect of a new division on some other question. The Cabinet accordingly resolved to bring in the Secret Service Money Bill, which is usually considered to involve a vote of confidence, and to retire at once if they do not obtain a decisive majority on that point. It is, however, rumoured that the King has unexpectedly taken up the cause of the Ministry, and has expressed his readiness to avert their resignation, if necessary, by dissolving the Chambers, and trying the experiment of a general election. The Conservative party have also met in great force, and have sent a deputation to Marshal Soult and M. Guizot to intreat them not to resign. The deputation waited upon those Ministers on Wednesday, and received in reply a distinct assurance that they would not resign. At this meeting no less than 47 hitherto dissenting members gave in their adhesion to Ministers. —From Spain we learn that General Prim has been pardoned by the Queen, and that Zurbano has been arrested and shot in the scene of his late revolt, and upon the same spot where his two sons suffered a few months since. The Madrid Government had sent orders to spare his life, but the Captain-General of the province, acting upon previous instructions, had executed him before the respite had arrived. The fate of this chief, whose name is associated with some of the worst and most sanguinary acts which occur in the history of the civil war, has excited little sympathy; and many indeed regard the last scene of his career as an instance of retributive punishment.—From the United States we learn that the differences of opinion on the manner in which the annexation of Texas is to be accomplished are likely to prevent the Bill from passing the House of Representatives during the present session. We learn also that the revolution in Mexico has been terminated without bloodshed by the overthrow of Santa Anna, and the creation of a new Government composed of the most influential persons in the republic. This movement, it is said, will strengthen the public feeling in Mexico against the annexation of Texas to the United States.

Home News.

COURT.—The Queen and Prince Albert, and the infant Royal Family, have remained at Windsor Castle during the week. The Queen has taken horse exercise two or three times in the Riding-School, and whenever the weather has permitted has taken her usual walks with the Prince in the grounds of the Castle. The Prince on Saturday hunted with his harriers on Dorney Common, and shot in the royal preserves on Tuesday and Thursday. Last evening Her Majesty gave a dinner party at the Castle, and a concert of Sacred Music in the evening. It is expected that the Court will leave the Castle for Buckingham Palace on Monday next, the day before the assembling of Parliament, which will be opened by Her Majesty in person. On Saturday next, according to present arrangements, Her Majesty and the Prince will leave town for the Pavilion at Brighton, where the Court is expected to remain for about ten days or a fortnight. It is understood that during the sojourn of the Court at Brighton, it is the intention of Her Majesty and Prince Albert to visit the Duke of Norfolk at Arundel Castle, and the Duke of Richmond at Goodwood. The day on which Her Majesty will proceed to Arundel Castle is understood to be fixed for Monday the 17th, or Tuesday the 18th inst. The visitors to the Queen this week have been the Marquis of Douro, Sir Robert and Lady Peel, the Earl of Aberdeen, Count Pollon, the Speaker, and Mrs. Shaw Lefevre.—The Marquis of Ormonde has succeeded Viscount Sydney as Lord-in-Waiting; and Major-Gen. Sir F. Stovin has succeeded the Hon. Nelson Hood as Groom-in-Waiting on Her Majesty.

The Cabinet.—It is stated by the *Times* that Mr. Gladstone has retired from the Ministry, and that the vacancy thus arising at the head of the Board of Trade will be filled by Lord Dalhousie, now Vice-President of that Department, but without a seat in the Cabinet. Mr. Cardwell, M.P. for Clitheroe, was at first named as the successor of Lord Dalhousie in the Vice-Presidency of the Board of Trade—an office which is usually accompanied with a seat in the Privy Council; but it appears that this statement is premature, although there is no doubt that Mr. Cardwell will take office under the present Administration. The vacancy occasioned by the resignation of the Secretaryship of Ireland by the present Lord St. Germans, upon his accession to the peerage, will be filled by Sir Thomas Fremantle, who succeeded Sir Henry Hardinge last spring as Secretary-at-War. Mr. Sydney Herbert takes the War-Office, with a seat in the Cabinet; and the Earl of Lincoln also enters the Cabinet, retaining his present office at the Board of Woods and Forests. The retirement of Sir John Barrow, and the promotion of Mr. Sydney Herbert, leave both the Secretaryships of the Admiralty at the disposal of the Government. Mr. Corry has been mentioned as Mr. Sydney Herbert's successor; and Captain Hamilton, Private Secretary to the Earl of Haddington, is said to be the successor of Sir J. Barrow. A Cabinet Council was held on Monday, at which many of these appointments are understood to have been arranged.

Parliamentary Movements.—Sir R. Peel gives his first parliamentary dinner on Monday next, when the Queen's Speech on opening Parliament on Tuesday will be read. The Address will be moved in the House of Commons by the Hon. F. Charteris, one of the members for East Gloucestershire; and seconded by Mr. T. Baring.—In consequence of Lord Eliot's accession to the peerage, a vacancy has occurred in the representation of East Cornwall. Mr. Agar Robartes is mentioned as the Conservative candidate, and Sir Wm. Trelawney, the Lord-Lieutenant of the county, has come forward on the Liberal interest.—Mr. R. A. Fitzgerald, of Muckridge, who was removed by the Irish Lord Chancellor from the Commission of the Peace, is the Repeal candidate for Tipperary.

The Irish Peerage.—The Earl of Rosse has been elected a Representative Peer of Ireland. Mr. James Daly, formerly M.P. for Galway, and brother to the Bishop of Cashel, is about to be elevated to a Peerage, by the style and title of Lord Dunsandle.

Law Appointments.—As anticipated in our last, Mr. Platt has been appointed successor to Sir John Gurney, as one of the Barons of the Exchequer. Mr. Sheppard, Q.C., has been appointed Commissioner in Bankruptcy, in the room of the late Sir C. F. Williams.

The Portendic Claims.—It is stated that the King of Prussia, who was chosen arbitrator in the affair of Portendic, has awarded to the English claimants an indemnity of 1760*l*. The sum claimed was from 80,000*l*. to 100,000*l*.

Foreign.

FRANCE.—We gave in our last the result of the first division in the Chamber of Deputies on an amendment to the first paragraph of the Address, by which the Cabinet were triumphant by a majority of 28. We now learn that they were again successful in Friday's sitting, when the second paragraph of the Address was adopted, after the rejection of another amendment, the object of which was to censure the negotiations with Morocco and the treaty in which they have ended. The mover of this amendment was M. Gustave de Beaumont, and its object was to cast blame on the Ministry for their conduct in the mode of carrying on the Morocco war, and especially as regarded the treaty with which the war concluded. He blamed the Ministry also for having pushed forward the Prince de Joinville as a negotiator upon that occasion, in order to conclude an obnoxious treaty for which they themselves should alone be responsible. He then analysed the treaty, and blamed especially the stipulation in the fourth clause, that Abd-el-Kader, if taken, should be treated with generosity by France. After blaming some other parts of the treaty, he concluded by saying that the affair of Morocco was concluded by an unsatisfactory treaty, in consequence of the dispute about Tahiti. Marshal Bugeaud rose to reply, and his speech was listened to with great attention and evident disappointment by the Opposition. He admitted that when the treaty was first signed he was not completely satisfied with it, but reflection, and what was going on in Morocco, had made him change his opinion. The Emperor could not easily have seized upon Abd-el-Kader, which was the only point of importance. He never thought that an indemnity should have been insisted on. The Marshal then entered into some details of the manner in which the campaign was conducted, in order to show that all had been done that could possibly be done by so small an army as he had under his command on the frontiers of Morocco, and that one of the principal reasons why he did not march upon Fez was, that the heat was so overpowering that the soldiers could not march. He said that the country was tranquil and improving; expressed his conviction that it would be eventually of great advantage to France; advocated strongly the principle of military colonisation in preference to that of civil settlement; and concluded by declaring that the present force of 80,000 men was not sufficient for the vast extent of country which was under his command; but that 100,000 at least ought to be voted by the Chamber, if it intended that the resources of that country were to be fully called into action. The Marshal was listened to with attention by all parties in the Chamber, and at the conclusion was enthusiastically cheered. M. St. Marc Girardin followed, and expressed his opinion that Marshal Bugeaud was the person who ought to have been entrusted with the negotiations relative to the treaty and not the Consul-General at Tangiers. He considered the unsatisfactory nature of the treaty, as owing to the choice of improper agents, and he concluded by calling upon the Chamber not to give a vote of approbation to

the conduct of the Ministry. After a few words from M. Guizot, in which he stated his determination to oppose the amendment, the Chamber divided, and the amendment was rejected. On Saturday a very interesting debate took place on an amendment on the third paragraph of the Address, proposed by M. L. de Malleville, the object of which was to express the disapprobation of the Chamber at the indemnity to be given to Mr. Pritchard. The words of the amendment are, "We are satisfied to learn that the understanding so necessary to the repose of the world has been maintained between the two States; but we regret that in conceding a reparation which was not due, sufficient regard was not had to the rules of justice and reciprocity which France will always respect." M. de Malleville said that the question of Tahiti had roused the susceptibilities of France, and that the settlement of that question was the subject of discontent with all parties, though the supporters of the Ministry thought it best not to speak their real opinions. The national honour had been wounded, and the only way to restrain the indignation of the public was by giving it just and legitimate satisfaction. For that purpose he brought forward an amendment condemnatory of the fault committed by the Ministry; so that the approbation of the Chamber should not be given to the abasement of the Government. He declared that the acts committed by the Government compromised the alliance between the two countries more than the Opposition, of whose hostility so much was said. He then took a review of the events in Tahiti, and endeavoured to show that France had made undue concessions to England, especially in giving an indemnity to Mr. Pritchard, who was there as a spy on the French authorities. He concluded by saying, that the indemnity was a mere shift invented by the Ministry to get out of a difficulty, and he hoped that the Chamber would not agree to it. For that reason he had proposed the amendment, and if a different form were desirable, he was willing to adopt it. M. de Peyramont contended that the indemnity was due in consequence of the unnecessarily harsh conduct of M. D'Aubigny, and that the Government had followed a wise policy in not making such a trifle a cause of war. M. Odillon Barrot followed. He admitted that it was necessary to respect the susceptibilities of both nations; but he thought the proper mode had not been adopted of doing so. He declared solemnly that, looking to the facts known and the documents produced by M. Guizot, the disavowal inflicted upon M. D'Aubigny, and the indemnity granted to Mr. Pritchard, were not in conformity with the rules of equity and reciprocity. The acts done by M. D'Aubigny were an imperious duty. Mr. Pritchard had been previously appointed to another place, but he remained in the island, in order to excite the islanders against the French. Pritchard was the only firebrand. He concluded by declaring that he would support the amendment, because there was neither equity, dignity, nor reciprocity in granting an indemnity to a person who had kindled a war of savages against civilisation. M. Guizot followed, and denied that either England had threatened or France had feared, or that such considerations had influenced the settlement of the question. The positions of England and France required mutual forbearance, and mutual concessions. At the same time he admitted that nothing could compensate for any concessions which would be a real abasement to France; and he denied that the issue of the Tahiti affair was so. The establishment of the French protectorate was a veritable substitution of the French influence for that of England, although the latter had been established for 40 years. With an established protectorate, the taking absolute possession was quite unnecessary, and as they now were, could only lead to difficulties and embarrassments. "With regard to the expulsion of Mr. Pritchard," said M. Guizot, "two things have been overlooked—first, that at the moment when Mr. Pritchard was expelled he had been recalled by his Government; he had been removed from Tahiti and sent elsewhere. England had taken into consideration our remonstrances on the inconvenience of continuing Mr. Pritchard at Tahiti; she had given us satisfaction by recalling him. When Mr. Pritchard was expelled, he demanded that an inquiry be instituted into the facts with which he was charged; he asked to be tried, and repeated that request after his return to England. He maintained, wrongfully, I believe, that he was a stranger to the explosion of the civil war and to the revolt; he contends that it would have been impossible to convict him, had he been tried, for want of proof. Our agents at Tahiti did not deem it expedient to adopt such a course. I approve their conduct. I regard their conviction respecting the intrigues of Mr. Pritchard and the danger of his presence as well founded; the trial would have been difficult and dangerous, and perhaps productive of no result." M. Guizot then described the effect created in England by the expulsion of Mr. Pritchard. "We wished," he said, "to give time to the agitation to subside; we assumed a passive and expectant attitude, persuaded as we were that this result would be attained when the truth should become known. We were strongly urged. Nothing was officially demanded from us, we were in nowise threatened. No Government in Europe, whether friendly or indifferent, would presume to address in any shape, directly or indirectly, any menaces to the King's Government. We did not require to be told that the situation was serious. We knew that a solution should be given to it; that France should take a decision, and say something on what had occurred at Tahiti, otherwise serious events would be the consequence. After a month's delay, we made known to the English Government our opinion and resolution. We maintained that our agents had the right to expel Mr. Pritchard, and that they had acted properly in expelling him. We then added, as I myself stated to our agent from the beginning, that we regretted and disapproved certain proceedings and circumstances in his conduct. I persist at present more strongly than ever in that opinion, after what has been said at this tribune. M. Guizot next justified the promise of an indemnity to Mr. Pritchard, not on account of his expulsion, but because the proceedings which the Government had blamed might have produced the injury and sufferings of which he complained. "We did not admit," he added, "the truth of the facts on his own assertion. We promised to give him an indemnity if his claim were well founded; the facts will be verified on the spot by the English and French Admirals, and if those facts be such as Mr. Pritchard describes them, the arbitrators will fix the amount of the indemnity." M. Guizot again observed, that the situation in which the Government had found itself, during the whole transaction, had been extremely serious, having been placed between the alternative of a compromise or a rupture. "The compromise, of which the Chamber knows the conditions," he said, "appeared to us equitable and proper. The English Government was of the same opinion, and, strange to say, it is at this very moment accused of the same errors and faults with which we have been reproached. As for us, we do not regret what we have done; we did not hesitate, nor should we hesitate to-day, if it was to do over again. I am convinced that on the other side of the Channel Sir Robert Peel and Lord Aberdeen will have the same thoughts and hold the same language that I do, and that they will not either regret what they have done. I am convinced that the two Governments, and I will say the two countries, will congratulate themselves on such a compromise having averted such a rupture." M. Dufaure said that he had been one of those who approved of the extension of French influence in the Pacific; but that did not prevent him from acknowledging the subsequent errors committed by the Ministry. He supported the amendment and declared that if the Chamber approved of the clause of the Address as it now stood, it would be a notification to the troops in Tahiti that not only the Government, but the representatives of the nation had granted the indemnity to Mr. Pritchard. The Chamber then divided. On the first trial the President declared the decision doubtful. On a second trial one of the Vice-Presidents declared that in his opinion the Opposition had the majority, and another of the Vice-Presidents declared the majority to be doubtful, while the other two gave their opinion that the Ministerial party was in the majority, so that the amendment was rejected. This decision was loudly exclaimed against by the Opposition, and in the midst of the tumult which followed, M. Sauzet hurriedly left the chair, and adjourned the sitting, forgetting in his hurry to put the main question. On Monday the Chamber of Deputies resumed the debate on the third paragraph relative to Tahiti. The hall was crowded to excess in every part, and the utmost anxiety was manifested respecting the fate of the paragraph. The Opposition moved no fresh amendment, and the minutes of Saturday's stormy proceedings were approved amidst some laughter, M. Garnier Pages having alone attempted a protest against it, which the Ministerial party and the president easily silenced. M. Billault spoke with much vehemence against the paragraph, and excited considerable clamour on declaring that such as had courage enough to vote for the Pritchard indemnity ought to do so openly. The Minister of Public Works defended it, and said that Ministers were resolved to make it a Cabinet question. M. Odillon Barrot followed, and with great warmth concluded by asking whether an indemnity would in common justice be granted to Mr. Pritchard, who had fomented a sedition and a rebellion which had caused the destruction of nearly 200 Frenchmen. M. de Gasparin rose last, but his defence of the Cabinet was interrupted by loud cries for a division. The President then notified that 20 members had called for a ballot, and this demand, which was evidently made by the Ministerial party, was loudly derided by the Opposition. On the ballot taking place the voters proved to be 418 in number, 213 being in favour of the Committee's paragraph, and 205 against it, thus leaving the Ministry a relative majority of only 8, and of only 3 above the "absolute majority." This result was received by the Opposition with deafening cheers, and they appeared to consider it a most decided triumph over the Cabinet. After this ballot the excitement was so great that the debate was for some time suspended, and the Opposition deputies raised loud cries of "The Ministry is dead!" "There is no longer a Ministry!" "And there being no Ministry," said M. Thiers, "I advise all my friends to decline further discussion on the Address!" This was instantly agreed to by the Opposition, and on the debate being resumed, the paragraph of the Address relative to the "right of search" was passed, as well as all the remaining ones, the Opposition withdrawing the amendments they had intended to move, and seeming or affecting to consider the result of the ballot on the third paragraph so complete a defeat of the Cabinet that it needed no further effort to annihilate it. At length, when the leading members of the Opposition had left the Chamber, the whole Address was put to the vote, when there were—For the Address, 216; against it, 33; majority, 183! This extraordinary result is said to have taken all parties by surprise, and to have been altogether unexpected by Ministers, who were completely overthrown by their small majority on the Tahiti paragraph. It is said that immediately upon the division on that paragraph, Marshal Soult proceeded to the Tuileries, to take the King's commands. His Majesty would not break up the Cabinet, but recommended that Ministers should at once elicit the real desire and intention of the Chamber; and accordingly they determined on bringing in the Secret Service Money Bill for that purpose. In addition to the warm encouragement the Ministers received from the King, a large number of Deputies waited on M. Guizot, on Monday evening and Tuesday, and strenuously exhorted him to continue in office, and not to relinquish it after the general tenor of his policy had been approved by the majority of 28, which he had obtained on M. de Carne's amendment.—All the Opposition prints notify that they will publish and forward to every commune in France the names of the feeble majority who, on Monday, voted for "The Pritchard Indemnity;" this list is to be from time to time circulated, in order to prevent the re-election of the Deputies figuring in it, and is certainly likely to injure them, for the conclusion of the unfortunate Tahiti affair appears, by all accounts, to have been viewed with the utmost repugnance throughout the country. The Chamber assembled on Tuesday afternoon, but nothing of the slightest interest took place. They adjourned after regulating their proceeding as to several Bills already reported upon. In the monthly selection of the standing committees the Ministerial party prevailed, in seven out of nine.

SPAIN.—We have accounts this week of the capture and execution of Zurbano in the neighbourhood of Logrono, the scene of his late revolt. The rumours which prevailed of his escape into Portugal were spread by his friends, with a view to lull the vigilance of the Government, and enable him to seize a favourable moment of reaching the frontier. Supposing this moment arrived, it appears that, in company of his brother-in-law, Cayo Muro, he left his hiding-place, at a country house in the immediate neighbourhood of Logrono, and was arrested near the spot where his two sons and other partisans had been arrested. The officer who effected his capture was an old comrade known under the *sobriquet* of El Rayo (the Thunderbolt). The latter had been long in pursuit of him, having sworn to take him alive or dead. His brother-in-law, Cayo Muro, a Major of cavalry, on half-pay, was shot dead, in endeavouring to escape by a window. Zurbano was less fortunate; being taken prisoner, he was led to Logrono, where the Governor, Brigadier Aynat, commanded him immediately to prepare for death. He was shot in the back, in the market-place of Logrono, at 11 o'clock on the morning of the 21st ult. Zurbano met his fate with great firmness. A short time before his execution he had an interview with his wife and only surviving son—the remaining two, Benito and Felician, having been shot upon the same spot where their father suffered. The Ministry on hearing of his capture attempted a show of mercy, and having met on the 21st and 22d, despatched a courier to Logrono, with orders to the authorities to spare his life, although it was well known that the Captain General of the province had ordered that his execution should take place immediately. This celebrated chieftain, whose name has occurred so frequently in the recent history of Spain, was the youngest son of an honest farmer of Barea, near Logrono. His father wished to make a priest of him, and he studied for that vocation; but as his conduct did not correspond with his father's views he was subsequently put to work on the farm. He married very young, and hired an extensive farm, but becoming weary of that sort of life he turned smuggler. He did not succeed in his new occupation, and got into embarrassments, which affected the health of his wife, and she died. He then married Hermenegilda Martenez (his widow), the daughter of an innkeeper, and continued the contraband trade, but with so little success, that he finished by associating himself with a band of thieves, of whom he became the chief. A prosecution was commenced against him, and he was condemned to death by default. He wandered a long time in the mountains, and his wife was arrested as his accomplice, but she made her escape from the house in which she was imprisoned. The civil war breaking out, Zurbano one night entered Logrono, and went secretly to a monk, to whom he communicated his intention of joining the Carlists, and, as an earnest of his zeal, revealed a plan for blowing up the powder-magazine of Logrono, in order that the Carlists might take possession of the town during the confusion. The monk introduced him to several friends and Zumalacarregui, and the affair was decided upon, but when everything was ready for execution, Zurbano went to the civil governor, and offered to reveal what was going on, with the names of the parties engaged in the plot, on the condition of his receiving his own pardon for past offences. This was granted, and Zurbano, having formed a small band, commenced against the Carlists those bold excursions which raised him in the end to the highest grades of the army, and ended by the catastrophe which has involved the whole of his family. As to the monk, he and another person were executed, and several of the inhabitants of Logrono were sent to the Presidios for the part they had taken in the plot. Zurbano thus made his first step on ambition's ladder by the aid of the blackest treachery; and, as his hiding-place was betrayed to the Commandant-General, his public execution on the very spot of his former treason is considered by many as a retributive punishment. The Government have published a decree, whereby the royal clemency is extended to General Prim. It is preceded by a report from

General Narvaez, expressing the wish of the Council of Ministers that the Queen's pardon be vouchsafed to Prim, whose mother had petitioned the Government in his behalf. Instead of being banished to some distant colony, the young General is permitted to take up his residence at Madrid. A courier had just been despatched with the news to Cadiz, where he was imprisoned in the fort of Saint Sebastian. It was rumoured that several more political offenders were to be objects of the royal mercy.—The election for the province of Madrid, which was rendered necessary by the resignation of the Marquis de Viluma, in consequence of his dispute with the Ministry, has terminated, so far as the capital is concerned, in 8 votes for the Marquis de Viluma, and 2269 votes for the Ministerial candidate, Senor Galiano.

Portugal.—We have accounts from Lisbon to the 22d ult. The estimates were presented to the Chamber of Deputies on the 19th inst. The revenue for the fiscal year 1845-6 is set down at 10,756 contos, the expenditure at 10,717 contos; giving an excess of revenue over expenditure, 39 contos. The financial representation is flourishing, but how far the real state of affairs bears it out is doubtful. Another measure has been adopted affecting some British subjects, and amongst others the Duke of Wellington and Marquis Beresford—a reduction of grants and pensions to the "Classes Inactivas," and those of them held especially entitled to payment by peculiar considerations. The Bill for the Abolition of the Conservatorial Courts passed through the Chamber of Deputies unanimously.—From Madeira we learn that the same theological questions which are now so rife in this country have extended their influence to that island; and the last vessel which arrived thence has brought some representations from the English residents there to the Bishop of London. One of these refers to the conduct of two clergymen of the Church of England who have made themselves notorious by their constant attendance at the Roman Catholic services, and with avowed devotional purposes. These gentlemen, it seems, have been seen to attend the Roman Catholic chapel, even on Sunday, and when there, to kneel to the Host, and they are moreover the clergymen who are specially selected by Mr. Lowe, the English chaplain there, as his favourite assistants, while all clergymen who will not preach without using a prayer before the sermon are altogether excluded from his pulpit. Upon this subject, as well as upon some others affecting the general conduct of the chaplain in the performance of Divine service, such as violations of the rubric and the introduction of novelties into the ritual, the English residents have at length invoked the interposition of the Bishop of London, whose control extends to the island. These representations are signed by two Members of Parliament and four clergymen, besides laymen.

Germany.—Letters from Berlin notice the arrival and departure of many Cabinet messengers, with great activity in the offices of the Legations of the great Powers. They are supposed to have a reference to two important questions. It is affirmed that the Austrian Cabinet has very decidedly recommended the consideration of the question of a joint guarantee of the land frontiers of the Ottoman Empire. The second question relates to the pacification of Spain, and the recognition of its Government by Austria, Russia, and Prussia.—The committee appointed by the Colonisation Company, founded last year in Berlin, under the patronage of Prince Charles and the presidency of the Prince de Schœnberg, has returned from the Mosquito shore, and its president, Baron de Fellechen, has presented a report of its proceedings to the company, of which the following are the leading points:—"The Queen of the country, on the arrival of the committee, went out to receive it in her great canoe, made of the hollowed trunk of a mahogany tree, 48 feet in length, and 6 feet in width, and welcomed them with great earnestness, saying that her late husband, in dying, recommended her to give the most favourable reception to all Europeans, as the best means of saving the natives from imminent ruin. Being the sovereign of the whole country, the Queen granted gratuitously to the committee a very large tract of land, of triangular form, the base running along the shore, and the apex extending far up the country. This land is of excellent quality, and will produce in abundance all the most valuable trees and fruits of the tropics. The climate is very mild, the great heat being tempered by the sea-breezes, insomuch that it does not much exceed that in the south of Germany. The committee met with none of the inconveniences complained of by former navigators. They saw scarcely any of the venomous insects, and were never obliged to cover themselves with the sail-cloths which they took on shore to protect them from their bites. The venomous reptiles, indeed, seemed to be almost extinct, and it was with difficulty that they procured three rattlesnakes for the Museum at Berlin. They saw one caiman (a large species of the crocodile), which was not more than 3 ft. long. The report mentions the Queen in very high terms, representing her to be a tall handsome woman, about 40 years of age. She has three sons, the eldest of whom, aged 14, was receiving his education at an English establishment on the right bank of the river Blewfield.—The Princess of Bavaria was safely delivered of a son on the 7th ult. The Prince has been christened by the Archbishop of Munich, and bears the name of his grandfather Louis. The Queen of Bavaria assisted at the ceremony, and left Munich immediately for Austria, where the accouchment of her daughter (the Archduchess Hildegarde) was hourly expected.—Letters from Coblentz state, that Bishop Amelde has issued an ordinance to his clergy, announcing that he has resolved to constitute a special holiday in honour of the holy garments of our Saviour, and of the other reputed relics, namely, the nails and the spear; that this *fête* shall be celebrated on the Wednesday following the third Sunday after Easter. As a contrast to this announcement it is stated in letters from Breslau, that the re-action caused by the excommunication of M. Ronge, the Catholic priest, who denied the authenticity of these relics, will lead to an immediate and extensive secession. The Roman Catholics of Breslau who have resolved to withdraw from the supremacy of Rome, will take the first decisive step, and in a few days there is to be a general meeting, when M. Ronge will state his views respecting the measures which are now necessary.—From Munich we learn that a Ministerial decree of the 13th prohibits the entry into Bavaria of cattle, sheep, pigs, wool, raw skins, &c., coming from Saxony. Not only the wool arriving from Bohemia, but also that in transit through that country, is rejected by Bavaria, because according to official advice, the murrain still prevails in a most alarming manner in Bohemia, and scientific experiments have shown that not only the wool, but silk and cotton stuffs are impregnated with this contagion.

Belgium.—A circumstance has lately taken place at Antwerp, which has created there a great sensation, and which concerns in no small degree the British as well as the Belgian Government. The British Consul, on the 4th inst., took upon himself to affix the seals of the royal arms of Great Britain to the door of the church in which service is performed according to the English ritual. This appeared a very extraordinary proceeding on the part of the British functionary, inasmuch as the Belgian Government, with great liberality, not only gives the building gratuitously for the use of the Anglican Church, but allows the British chaplain an annual salary of 2000 francs. Application was forthwith made to the Belgian Authorities, who ordered the Consul to remove the seals affixed to Belgian property, and to pay all the expenses incurred for the purpose of getting the church opened. This collision between the English Consul and the Belgian Authorities will be referred to the Foreign Office.

Holland.—The population of the Netherlands was, according to the official reports, on the 1st January, 1844, as follows:—Provinces of—Northern Brabant, 394,406 inhabitants; Gueldersland, 363,169; Southern Holland, 551,173; Northern Holland, 459,133; Zetland, 157,486; Utrecht, 151,179; Friesland, 239,673; Overyssel, 207,907; Groningen, 184,019; Dreuthe, 78,854; Limbourg, 200,573—Total inhabitants, 2,988,172. The number of births has been, for the same year, 105,350; that of deaths, 73,615; and that of marriages, 21,212. The net increase of the population over the present year has been 7040.

Italy.—A letter from Rome of the 6th ult. says:—"Our Government is beginning to occupy itself with the manufactures of the country. Upon its invitation, all the manufacturers of the Roman States have submitted samples of their productions to the examination of a commission, formed of men of the arts and sciences, among whom are the Cardinal Chamberlain, Prince de Riario Sforza, and the treasurer, Cardinal Tosti. This commission has awarded premiums in money to the manufacturers of the best cloths, and to some has granted loans, without interest, to enable them to extend their business. The cloths sent in to the commission have come chiefly from the manufactories of Rome, Bologna, Spoleto, Mattelica, Alatri, Perugia, and Norcia. They are all of excellent quality, and show a considerable improvement in this useful branch of the arts; but they are far from being able to maintain a competition with the cloths of France. They do not even equal the cloths made in the Rhineland of Germany, which are sold here as French cloths of second and third quality."

Turkey and Syria.—Letters from Constantinople of the 8th ult. state that our position with the Porte continues most critical. Sir S. Canning has made the settlement of the demands which he urged in the late conference a kind of *ultimatum*, and though more than a fortnight has since then elapsed, it appears that there is no approach towards their final adjustment. These demands may be classed under two heads—firstly, debts amounting to about 150,000*l.*, owing by the late Bey of Tripoli to British subjects; and secondly, the proper fulfilment of the commercial treaty.—Accounts from Alexandria of the 6th ult. mention that the plan of establishing a railroad between Cairo and Suez had been nearly abandoned. The French engineer M. Mougel, had proposed to the Pasha to open, at an expense of not more than 150,000 talaris, a canal between Cairo and Suez, by means of which goods landed at Suez would be conveyed in boats from that harbour to Alexandria. Three sluice-gates would be required for the purpose, one at Suez, the other at Wadi, below Cairo, and the third at Alexandria. The epidemy still raged among the cattle. Upwards of 9000 oxen, imported from Tarsus, had lately died of it in Lower Egypt. It would appear from reports current at Alexandria, that the Russians were collecting a large military force in Armenia, and that another treaty, like that of Unkiar Skelessy, was on the tapis at Constantinople.—Accounts from Syria bring the third annual letter of the Bishop of Jerusalem, dated October last. The Bishop says—"The fact of our having nearly completed the third year of our residence in a country of peculiar trial and danger, in the face of all kinds of difficulties, is in itself a cause of thankfulness. But we have to speak of more than this. It has been our privilege to perceive a gradual increase of our establishment, quite sufficient to lead us 'to thank God and take courage.' Whilst we are still strangely kept in suspense as to the building of our church, &c., notwithstanding the many promises we have had during the past year that permission was on the point of being granted, we have, in the good providence of God, had our church accommodation enlarged since I last addressed you; so that we have at present a commodious place of worship, though even this has, on some occasions, proved inadequate, particularly when the number of strangers has been large. Our regular congregation has also been on the increase; so much so that our former church could not have held them. This has arisen partly from the mission having been increased by the arrival of additional labourers, and partly from converts, 13 of whom have been added to the Church by baptism during the last year, and some are now under instruction, who, of course, regularly attend the services. We have, in consequence, opened an additional full service on Sunday evenings, and established a lecture on every Wednesday, besides the daily morning (Hebrew) and evening (English) service. Since our arrival in the Holy City, I find 37 baptisms recorded in our register, and 26 of those baptised have been confirmed. Nine individuals have been ordained deacons, and five priests, who are gone forth as heralds of mercy, to proclaim the glad tidings of salvation, four of whom are of the house of Israel. At the last ordination, which was held on Sunday, September 1, three candidates were ordained for the different missionary stations of Hebron, Beyrout, and Bagdad. On that deeply interesting occasion we had no less than 57 communicants. We now generally number from 40 to 50 at the regular celebration of the Lord's Supper, on the first Lord's-day in every month." The German papers state that the Austrian Government, in order that France may not assume to herself the exclusive protectorate of the Christians in the Holy Land, has appointed a commission charged with that duty on the part of Austria.

Greece.—Accounts from Athens of the 31st ult. announce that the chief subject of conversation in that capital is a note, said to be communicated by Austria to the other great Powers, directing their attention to Greek affairs, and suggesting that the following resolutions should be agreed to between them:—"1. That considering the dispositions obligatory which established the Hellenic kingdom, the 40th article of the Constitution should be suppressed, which requires that the heir to the throne should be of the Greek Church. 2. That the Powers, being determined to regard the present boundaries of Greece as decidedly fixed, disapprove any attempt to extend them. 3. That desiring the consolidation of the Greek Monarchy, they should see with displeasure any attempt to disturb the tranquillity of the interior." There was but one British ship of war at the Piræus, the Belvidera, Capt. the Hon. G. Grey. The French Admiral Turpin remained there with several ships of the line and one frigate.

United States.—We have accounts from New York to the 10th ult., two or three vessels having arrived this week. The debate upon the annexation schemes opened on the 3d in the House of Representatives, when three several plans were submitted in committee, but the contrariety of opinion on the mode of the admission was so great, that it was believed that no plan could be agreed upon which would command a majority of the dominant party. In the Senate, on the 8th, Mr. Sturgeon presented a petition from a number of citizens of Pennsylvania, praying for the immediate organisation of Oregon as a territory of the United States, that donations of land may be granted to American settlers there, that lines of forts be extended from Missouri to Oregon, and that large vessels of war be sent to the mouth of the Columbia river to protect the rights of the United States in that quarter. The petition is referred to the Select Committee on Oregon.—The news from Mexico, which is later than that brought by Mr. Cushing, shows that the case of Santa Anna is hopeless. A revolution, perfectly bloodless, had been effected in the city of Mexico; the troops of Santa Anna, at the head of which was Canalizo, to the number of 2000, had shut themselves up in the palace, a decree signed by that officer for dissolving Congress having been previously issued. The senators and deputies met, protested against the decree, and denounced the government of Santa Anna. Sixty-five deputies, and all the senators, except four, signed the protest. In the meantime the revolutionary movement was strengthened by the accession of the clergy and the Liberals; and at the head of the populace General Herrera forced the palace, seized Canalizo and the leading personages attached to Santa Anna's government, and on the 7th December, the new Government, at the head of which is Herrera, was organised, and the names of the new Cabinet were announced by proclamation. According to the *New Orleans Bee*, the new Ministry is composed of the most able and honest men in the country. Around it are said to be arrayed all the wealth, power, and influence of the republic. These proceedings were followed by great rejoicings. Messages of congratulation passed between the two houses of Congress, and the new President received the congratulations of that body and of the leading citizens. Congress had outlawed Santa Anna, who was still, when the former accounts had left him, at Queretao. The new Government offers him no terms short of his paying the twelve million of dollars, which he is alleged to have squandered. This movement, the United States papers seem to think will strengthen, rather than otherwise, the public feeling in Mexico against the annexation of Texas to the American Union.—The trial of Bishop Onderdonk, the Protestant Bishop of New York had terminated in his suspension. He was accused of a variety of unbe-

coming familiarities with the wives and daughters of the clergymen of his own diocese, and others. No absolute criminality appears to have been established, but enough was proved of his moral unfitness for the situation which he held. Nine bishops voted for suspending him, and eight against it. The suspension, it is said, will be perpetual.—The mortality amongst the fish from the east end of Long Island to the Capes of Virginia, extending from the coast into the sea for a distance of 3 miles, has caused some consternation; along the infected district millions of dead fish are daily thrown up; the cause is unexplained.—The last accounts from Havannah mention the receipt by the Governor-General of a royal decree, enjoining him to give satisfaction to England for the insult offered to Mr. Turnbull in his capacity as agent invested with the confidence of the British Government. Appended to that decree was the note addressed to that effect to M. Martinez de la Rosa by Mr. Bulwer. General O'Donnell had referred the examination of the affair to the first assessor, who was engaged in reading all the documents relative to the trials of the blacks implicated in the last conspiracy, to ascertain to what extent Mr. Turnbull was involved in it, and had not terminated his investigation when the packet left.

CITY.

Money Market, Friday.—Consols closed at 100⅛; Reduced Three per Cents., 100¼; New Three and a Quarter per Cents., 104⅛; Bank Stock, 215; India Bonds, 78; Exchequer Bills, 62 to 66 prem.

GAZETTE OF THE WEEK—BANKRUPTS—A. Hurrell, Parkplace, St. John's Wood, wine merchant—C. Moore, St. John-street, Clerkenwell, carver and gilder—W. and R. Smith Bowlane, City, warehousemen—C. Bergam, Newgate Market, carcase butcher—W. Fairclough, Liverpool, licensed victualler—C. M. Wilkinson, Ulverston, Lancashire, wine merchant—J. Kensall, Hanley, Staffordshire, fishmonger—W. Burr, Lisson Grove, New-road, lodging-house-keeper—J. Argent, Golden lane, Barbican, victualler—S. Brick, St. John-street, tailor—T. Wayte, Birmingham, hardware merchant—E. C. Fiewers, Whitchurch, Buckinghamshire, cattle dealer—R. Harris and J. Hill, Newgate street, tailors—E. L. Robinson, Moulton, Lincolnshire, fellmonger—R. Greenwood, Bradford, Yorkshire, bookseller—J. Cutting, Sheffield, grocer—J. and D. Hepworth, Halifax cotton warp dyers—J. Irving, Blackburn, Lancashire, linendraper—W. U. Lester, Aldermanbury, silk manufacturer—W. Blinkhoan, Little Bolton, Lancashire, manufacturing chemist—W. Fielding, Taunton, near Ashton-under Lyne, hat plush and silk manufacturer R. Jones, Liverpool, boot and shoe maker—A. Francis, Halkin, Flintshire, W. Davey, Coniston, Lancashire, and M. Francis, Aberystwith, ironfounders.

Metropolis and its Vicinity.

Statue of Prince Albert.—On Saturday a meeting was held at the London Tavern, of the merchants, bankers, and others interested in the commerce of the city, to promote the erection of the marble statue of Prince Albert, in such suitable spot in the Royal Exchange as might be agreed upon. The chair was taken by Mr. Baring, M.P., and a committee was appointed to carry out the proposition, of which Mr. Baring was appointed chairman, Mr. Masterman treasurer, and Mr. C. Graham, honorary secretary.

Royal Exchange.—The merchants of London have felt themselves so seriously inconvenienced by some of the peculiarities of the Royal Exchange, that a petition, of which the following is a summary, has been presented to the Gresham Committee:—"The undersigned merchants of the city of London are of opinion, that in the construction of the New Royal Exchange sufficient attention has not been paid to the comfort of those who attend the same, and beg most respectfully to submit to the Gresham Committee the following alterations, which are necessary before they can assemble there without danger to their health and personal comfort. The alterations suggested are—1. That the area be covered in. 2. That some remedy be provided to remove the cold damp from the pavement. 3. That a remedy be also provided to protect them from the currents of air." The above petition has been signed by Messrs. Barings, Rothschilds, and some hundreds of the first firms in the city. It is also said that a subscription is now on foot for the purchase of a clock, to be placed in some convenient position on the Exchange, as the large clock in the tower cannot be seen from the area.

The Marylebone Vestry.—On Saturday there was again a full attendance of the Marylebone vestry, created by the anxiety to hear the debate, adjourned from Saturday week, relative to the charges recently made against Dr. Penfold, rector of Trinity Church. The Rev. Dr. Spry, the rector of the parish, presided, all the local clergy were present, and Dr. Penfold also occupied his place in the vestry. The chairman called on Sir Peter Laurie, as the mover of the adjournment on the previous Saturday, to resume the debate on the resolution to appeal to the Bishop of London concerning the 25*l.* which Dr. Penfold was alleged to have improperly detained. Sir P. Laurie said, this important matter, which had been so fully discussed in the vestry last Saturday, would, he believed, be closed that day in a most satisfactory manner. He was glad to have it in his power to state, that it would be wholly unnecessary for the vestry to carry the resolution which had been adopted on the first occasion, inasmuch as the 25*l.* had been paid into the hands of the trustees of the Charity School. Under such circumstances, he hoped that the non-confirmation of the minute for going to the Bishop of London concerning the subject would be at once and unanimously carried. He was much pleased to know that a general assent would be given to the proposition for non-confirmation, and the more so, as he hoped that the result would have the effect of preserving a good feeling between the clergy and laity of that most opulent and extensive parish. Mr. Eyre said he had felt convinced, when he seconded the non-confirmation, for the purpose of affording the Rector of Trinity an opportunity of explanation, that he would vindicate himself from the charges made against him, and he thought he had done so triumphantly. He had nothing further to say than that he entirely agreed in the hope expressed by Sir P. Laurie, that henceforth a good feeling would exist between the clergy and the laity of the parish. The Chairman put the question to a show of hands, and having taken the contrary opinion, said he felt great pleasure in stating that the non-confirmation of the minute was carried unanimously. The Rev. Dr. Penfold instantly rose, and having bowed left the vestry.

The Ranger's House, Greenwich Park.—The Earl of Aberdeen, Secretary for Foreign Affairs, has taken possession of Chesterfield House as the new Ranger. The sale of the effects of the late Princess Sophia Matilda, which have been advertised to be sold by public auction, has been countermanded. Upwards of 1000 catalogues had been disposed of, at 1*s.* each. Another catalogue has been issued to dispose of only a part of the effects, the rest being taken by Lord Aberdeen at a valuation. This sale commenced on Thursday, and the articles all realised high prices.

Present from Her Majesty to an Artisan.—A few days ago Her Majesty accepted from an artisan, named Wood, in the employ of Mr. Winsland, builder, a shell of the nautilus, on which he had engraved with a common penknife about 1500 words, together with the Royal Arms, Prince of Wales's Feathers, the Great Britain and Great Western steam-ships, &c. On this occasion some gold was put into the hand of the artist on his leaving the Castle, for the purpose of defraying his expenses back to town, and he left highly delighted that he had accomplished a work that was deemed worthy of acceptance by his Sovereign. A few days since a large packing-case was brought to the humble abode of the artisan, in Harp-court, Fleet-street, which contained a proof impression of Sir George Hayter's Coronation picture, in a rich gold frame, tastefully ornamented with the rose, shamrock, and thistle, in burnished and dead gold. The picture, to the delight of the astonished artisan, proved to be a present to him from her Majesty.

The Great Britain Steam-ship.—This extraordinary vessel, which has created so much interest in naval circles, left Bristol on Thursday for London, and arrived at Blackwall on Sunday afternoon. The voyage was a very stormy one, but it was in every way satisfactory to a large number of gentlemen and naval officers, who had taken their passage in her. Our readers are aware that the Great Britain is built of iron, and that she is propelled by the screw. She has six masts, which give her an extraordinary appearance; they are all fitted with iron rigging, adopted in consequence of its offering two-thirds less resistance than hemp, a great point in going head to wind. It was wished that five should have been the complement, but there was some difficulty in adjusting that number, and the alternative was either four or six. Five masts of the six are hinged for lowering, when, in the captain's judgment, contrary gales shall appear to have set in, as the westerlies do at certain seasons of the year, prevailing for months in the Atlantic. In taking up her moorings at Blackwall, as the tide was flowing, the Great Britain had occasion to swing round, and in so doing she presented a singular appearance, for when lying athwart the river she actually occupied nearly the whole breadth from bank to bank. Some idea of her extraordinary length may be formed, when it is stated that she is upwards of 100 feet longer than either of our first-rate line-of-battle ships, the Queen, Caledonia, and St. Vincent. The length of those vessels being 205 feet, while the length of the Great Britain is 322 feet, and the length of her keel 289 feet. She is to lay off Blackwall for some time, and will prove an object of great attraction to all those at all interested in nautical matters. During the voyage the Great Britain carried four large life-boats of iron, and two boats of wood in the davits, and one large life-boat on deck; they are capable of containing 400 people. From the time she left the Holmes light, at Bristol, until she arrived at Blackwall, she made 54,521 revolutions with her engine, and 163,563 revolutions with her screw. Captain Crispin, of Her Majesty's royal yacht, and Mr. Lloyd, chief engineer at Woolwich dockyard, were sent to take passage round in her, by order of the Lords of the Admiralty, in order to furnish reports of the capabilities of the vessel, and the power of the screw, Government having it in contemplation to build several large iron steam-frigates, to be propelled by the screw.

London Missionary Society.—A long correspondence between the Secretaries of the Missionary Society and the French Government, on the affairs of Tahiti, has been published. It appears from this that during the visit of His Majesty to England, in the autumn of last year, the Directors of the London Missionary Society solicited the favour of being allowed to wait upon the King by deputation, with a view to bring the subject of the French invasion of Tahiti under his notice. The reception of the deputation was then declined, for want of time. The Directors made a second application, expressing a wish to wait upon His Majesty by deputation, within his own dominions. This request was negatived, on the ground that the subject which the Directors wished to bring before the King was a political and diplomatic one; and could, therefore, be entertained only when presented through the authorised agents of Great Britain. Finding all their efforts to obtain an interview with the King of the French fruitless, the Directors transmitted to him a memorial, setting forth the whole of the circumstances connected with the history of their missions in Tahiti, and pointing out the disastrous results of the French aggressions. This memorial was accompanied with a letter addressed to M. Guizot, denying that the object of the Directors was political. To this memorial a reply has been received, stating that the missionaries will receive full [illegible] from the French Government at Tahiti, but declining the deputation. The Society considered this reply unsatisfactory, and addressed another letter to M. Guizot, expressing their hope that the Government of France will yet be convinced of the impolicy, as well as the injustice, of maintaining the occupation of the island, and restore to the Queen and her people their former freedom and independence.

Miss Jane Porter.—This amiable lady has just received a gratifying testimony of respect and admiration from the booksellers, publishers, and authors of New York. It is in the form of an easy-chair, richly carved and covered with crimson velvet. The letter which accompanies it expresses the sentiments of the donors and of thousands of American readers towards the author of "Thaddeus of Warsaw" and the "Scottish Chiefs," as "one who first opened up the path that has been since further embellished by the kindred genius of a Scott," and "whose charming productions have taught in so graceful and captivating a manner the lesson of true virtue."

The Fountains in Trafalgar-square.—From the rapid progress in every department of the works, these fountains will soon be in operation. The boring for water is completed, and a plentiful supply has been obtained. For several days the engines have been employed in raising water, which has been found quite equal to the demand which will be required, and a jet of water has readily been forced to a height of 30 feet in the basins. The well in Trafalgar-square has been sunk to a depth of about 160 feet, and that in Orange-street, Leicester-square, which is on a higher elevation, about 30 feet deeper. The large cistern at the top of the engine-house will hold 3[illegible] gallons of water, and that at the top of the tower, which is about 20 feet higher, about one-third of that quantity. In addition to the fountains, these are intended to supply the Government buildings and offices in the district, for daily use or emergency, in cases of fire, for which pipes are now being laid down. The ornamental iron work for the jets is in a state of forwardness. The water, which rises in the borings to about 60 feet of the surface, is pumped up by two Cornish engines of 20 horse-power.

College of Surgeons.—It is announced by the *Medical Times* that there is every probability of an immediate adjustment of the differences which have alienated from the College of Surgeons the good-will of its numerous members. Sir J. Graham has announced, it is said, his full acquiescence in the propriety of great modifications of the charter recently granted; and the council are arranging the details of a supplementary charter, which is to receive the sign-manual of Her Majesty on the earliest possible day. The improvements to be adopted are of a very varied but decided character:—1. All members, now and for the future, of 10 or 15 years' standing, whether practising pharmacy or not, are to be fellows *ipso facto*, and to have the plenary power of electing the governing body of the college. 2. Gentlemen practising midwifery will be eligible to be on the Council, which in future is always to be composed of a certain number of gentlemen practising in that department of the profession. 3. The Court of Examiners will be partially composed of surgeon-accoucheurs, and examinations in midwifery will form for the future an integral part of the surgical candidate's examinations. 4. Some new arrangements will be proposed, by which will be removed the barrier which now prevents surgeons practising pharmacy from ever sitting on the Council. 5. The Fellows will take seniority in the order of their standing as members of the College, and may propose, without reference to any list of precedence, any eligible member as candidate to fill any vacancies in the Council.—On Monday a meeting of Members of the Medical Profession took place at Exeter Hall, for the purpose of considering a motion by Mr. Wakley, for the adoption of a petition to the Queen, praying that Her Majesty would not sanction any alteration in the existing charters of the College of Surgeons, until the Members of the College, amounting to upwards of 10,000 persons, had an opportunity of stating their grievances, and what they felt to be their incorporated rights before the Privy Council. Mr. Wakley said, he thought there would be this advantage in taking the course he proposed—That it would be impossible for a Minister of the Crown, after learning from them how the Crown had been deceived in the grant of the last charter to the College of Surgeons by the representations of the Members of the Council, to listen to them again. He proceeded to urge the importance of union, stating that the power against them was immense: they had an enemy in the Government—they had an enemy in Parliament: and if they were enemies to their own interests, and remained disunited, nothing but defeat and discomfiture would be their lot. Mr. Cooper seconded the motion, which was carried unanimously and a committee appointed to prepare the petition.—On Tuesday a meeting of general practitioners resident in the City was held, at which resolutions condemning Sir James Graham's Bill were agreed to unanimously.

Bankruptcy Analysis for 1844.—Ale-merchants 4, apothecaries 9, attorneys 3, auctioneers 9, bakers 9, bankers 4, booksellers 10, boot and shoemakers 10, brewers 8, brickmakers 5, brokers 8, builders 44, butchers 14, cabinet-makers 11, calico-printers 4, carpenters 21, carpet manufacturers 4, cattle-dealers 7, cheesemongers 6, chemists and druggists 15, clothiers 5, cloth manufacturers 4, cloth-merchants 2, coachmakers 5, coach and omnibus proprietors 5, coal-merchants 11, commission agents 10, contractors (road, railway, and gas) 3, cooks and confectioners 4, corn-merchants and

dealers 17, cotton manufacturers 3, curriers 10, cutlers 3, dairymen 3, dealers 15, earthenware-dealers 3, eating and coffee-house keepers 3, engineers 6, engravers 2, farmers 7, flannel-makers 2, fruit-merchants 4, furriers 4, glass-merchants 3, grocers 53, hatters 6, horse-dealers 3, hosiers, 4, innkeepers 22, ironfounders 11, ironmongers 19, jewellers 7, lacemen 3, leather-sellers 3, lime-burners 3, linen-drapers 23, linen manufacturers 2, livery-stable keepers 7, lodging-house keepers 5, machinists 2, maltsters 7, market-gardeners 3, mercers 2, merchants 38, millers 19, milliners 3, money-scriveners 5, musical instrument-makers 2, nail manufacturers 2, oil-merchants 3, painters 2, paper-hangers 2, paper-makers 3, pawnbrokers 3, plumbers and glaziers 13, printers 5, printsellers 2, provision merchants 4, saddlers 10, sail-cloth manufacturers 3, shipbrokers 3, shipowners 7, shipwrights 4, silk manufacturers 4, silk throwsters 4, silversmiths 4, soap-makers 2, stationers 12, straw bonnet manufacturers 2, surgeons 13, tailors 28, tallow-chandlers 7, tanners 3, tea-dealers 8, timber-merchants 3, tobacconists 4, toymen 2, trimming-makers 2, upholsterers 9, victuallers 47, warehousemen 10, matchmakers 4, wheelwrights 1, wine and spirit-merchants 36, woollen-drapers 8, woollen manufacturers 3, woolstaplers 2, worsted manufacturers 3, worsted spinners 3, various 76. Total 1064.

Consecration of St. John's Church, Notting Hill.—This new church was consecrated on Wednesday by the Bishop of London, in the presence of a large body of the clergy. The building is in the Norman style, and consists of a nave and two aisles, with short transepts and a chancel. The bishop preached the sermon on the occasion, and a liberal collection was made at the close of the service on behalf of the building fund.

New Roman Catholic Church, Lambeth.—The Earl of Shrewsbury has presented to the committee of this church, now nearly completed, a very handsome chancel window, of painted glass, which cost 500*l*. The window is very large, measuring 30 feet by 18.

British Museum.—The number of visitors to the public rooms of this national institution last year was 542,937, being an increase, as compared with the preceding year (1843), of 25,497*l*.

The late Fleet Prison.—At a meeting of the Common Council last week, Mr. Dixon presented a report from the City Lands Committee on the subject of the reference made to them to open a communication with the Commissioners of Woods and Forests, to ascertain upon what terms the Fleet Prison could be purchased. The report stated that the Committee had offered 23,000*l*., but that the Commissioners of Woods and Forests had declined to accept less than 25,000*l*., the sum at which the property had been valued by three eminent surveyors. The Commissioners had given the Corporation an option of making the purchase at that sum until the 28th instant, and the Committee, by their report, unanimously recommended that the purchase should be effected. Mr. Dixon moved that the Court agree with the Committee in their report. Mr. R. Taylor seconded the motion.—Mr. Anderton expressed a hope that the motion would be unanimously agreed to. He had himself been told by an eminent architect that he was ready to give the sum demanded for the property, and to apply it to public purposes. That gentleman was now waiting to ascertain the decision of the Court on the subject.—Mr. Wire congratulated the Court upon the favourable termination of the negotiation, but he must express a hope that the purpose to which the property was to be put, when conveyed to the Corporation, would not be hastily decided upon. Knowing, as he did, the state of the city prisons, and the impossibility of enlarging the present structures, he hoped the land would be appropriated to the erection of a gaol for the city of London.—Mr. Prendergast sincerely hoped the ground would be applied to a much better purpose than building a gaol. After a short conversation the motion was agreed to.

New Zealand Company.—A special general meeting of this company was held on Thursday, for the purpose of considering the state of their affairs. Mr. Somes, M.P., took the chair, and amongst the gentlemen present were Lord Viscount Ingestre, Sir John Pirie, Sir I. L. Goldsmid, Mr. Stewart Marjoribanks, M.P., &c. The secretary read a brief report which stated, that in consequence of a correspondence between Lord Stanley and the governor, the directors recommended a fortnight's adjournment. The critical state of the company called for this course of proceeding. The correspondence was then read. Mr. Somes, in his letter to Lord Stanley, represented that the time had arrived when it was indispensable that the directors of the Company should decide on their future course, and therefore represented to his Lordship the importance of their being put in possession, as far as might be practicable, of the intention of Her Majesty's Government. Lord Stanley, in reply, informed Mr. Somes that he proposed, as the most proper and convenient course, to present the instructions issued by him to the Governor of New Zealand, subsequently to the report of the committee being made public, to both Houses of Parliament immediately after they meet.

Demolition of the Statue at King's-Cross.—The statue of George IV., at King's-cross, erected some years since from the design and under the superintendence of a gentleman named Geary, is now being rased to the ground. This unfortunate statue has always been a subject of ridicule.

The late Dock Robberies.—It appears by the police reports, that four men charged by the London Dock Company with being concerned in the late extensive robbery of tobacco from the London Docks, have been committed to take their trial at the next sessions of the Central Criminal Court. No evidence seems to have been brought against them, but that of being concerned in the tobacco robbery—though they had been remanded in the expectation that they were also the perpetrators of other extensive robberies of spirits at the neighbouring Docks, it being the opinion of the authorities that these daring robberies have been effected by a gang of plunderers well acquainted with the premises, who have managed to obtain admission into the Docks in a surreptitious manner, to await their opportunity. The several instances, therefore, of the robberies of brandy from the St. Katharine Docks continue undiscovered, not the least clue having been obtained to bring the matter home to the guilty parties.

The late Bank Robbery.—The Bank of England have, it is understood, repaid Messrs. Rogers and Co. the amount of the notes lately stolen, upon a guarantee of indemnity in case the notes themselves should be presented for payment.

Murder at Bethnal Green.—On Tuesday a young man named James Tapping was brought before the magistrates, charged with having murdered a young woman named Emma Whiter, to whom he had for some time been paying his addresses. The prisoner was recognised as having been in custody before, charged with having defrauded a number of shopkeepers in the district by selling to them as genuine oil what were found to be cans filled with water, with a small quantity of good oil upon the surface. On that occasion he was committed to Newgate for trial, was convicted and imprisoned for twelve months, and has been at large only a few months. The evidence now adduced proved that deceased was shot in the neck with a pistol, and though the prisoner was not actually seen to fire the shot, the testimony of the witnesses made out a strong case against him. He was seen walking with deceased only a few minutes before the report of the pistol was heard, and a pistol had been seen in his possession only a few days previously. The prisoner was remanded for a week for further evidence.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Jan. 25: West Districts, 148; Northern, 179; Central, 182; Eastern, 224; Southern, 269; Total, 1002; males, 481; females, 521. Weekly average for the last five years, 963.—Births in the week, 1340; males, 644; females, 696.

Provincial.

Birmingham.—On Friday morning the inhabitants of Deritend and Bordesley were thrown into a state of great excitement in consequence of an attempt made by Mr. Bunny, a wealthy carpenter, to kill his wife and afterwards to destroy himself. The unfortunate man, it appears, is a native of Coleshill, but has resided in Birmingham many years. He had long been known to be insane, and yet two days previous to this attempt he married a young woman of Deritend. Insanity showed itself almost immediately after the marriage, and on Friday he attempted to cut his wife's throat and afterwards his own. The neighbours heard the cries of his wife in time to force an entrance into the house, and it is believed that both parties will recover. The husband, it is said, is a confirmed lunatic, and will continue under restraint.

Braintree.—A numerous meeting of the principal tenant-farmers of the northern division of Essex, was held at Braintree last week, to consider the propriety of petitioning Parliament for the Repeal of the malt-tax. The chair was taken by Mr. Hobbs, of Marks Hall, who explained the object of the meeting, and pointed out the advantage that would accrue to the farmers from the remission of the malt duty. Several gentlemen spoke in support of resolutions, pointing out the injurious operation of the tax. The last resolution was in these words:—"That the repeal of this tax and its restrictions would give such an increase of consumption and consequent stimulus to tillage, as would afford additional employment to the agricultural labourers, who would thereby become better able to provide more of the necessaries of life for themselves and their families." A petition, embodying the spirit of the resolutions, was adopted unanimously, and it was agreed that the members for the county be requested to support it.

Bromley.—Our readers may remember that in November, 1843, a young woman named Harriet Mouckton was found dead in a watercloset at the back of the Independent Chapel at this place, and, as it appeared from the medical evidence, poisoned with prussic acid. The coroner issued his precept, and in due form commenced holding an inquest, which was adjourned six or seven times. The last meeting took place as long since as the 5th or 6th of January last year, and no day has been fixed for another meeting, or any determination come to on the evidence already adduced. Public attention has again been called to the case, by the fact that the foreman of the jury has left Bromley, and it is not known where he is to be found. It is supposed that another jury will be summoned, or, at all events, that some steps will at length be taken to clear up the case.

Cambridge.—The parishioners of Tottenham, whose recent successful efforts against the introduction of Tractarian customs into their churches is well known to our readers, have sent the sum of 21*l*. 19*s*. to the Rev. R. R. Faulkner, incumbent of St. Sepulchre's, in this town, as a contribution towards the fund for defraying the expenses of Mr. Faulkner's suit in the Arches Court, in opposing the stone altar, &c., which has been the subject of so much controversy.

Exeter.—We have received two letters from correspondents, in reference to the accounts of the late proceedings in this diocese, which have appeared in recent Numbers of our Paper. From one of these we quote the following passage in correction of an error quoted from the daily papers in reference to Dr. Coleridge's recent sermon at St. Sidwell's. Our correspondent says:—

"Your paper states that Dr. Coleridge is a Tractarian, which I think you will say is not a fair imputation to throw on any man, or even to adopt from other journals. But the principal points I call upon you in common justice to correct are these—that Dr. Coleridge did not use any preface to his sermon before the text, or call on the people as they left the church. This I have had from his own lips, and of course he feels much aggrieved that such an outrage of decency should be imputed to him. Next, that of a congregation of 1400 or 1500, not more than 20 left, among whom were Dissenters and strangers to the parish (your information being that there was 'a general rush,' and that 'half of them' left). Next, that Dr. Coleridge walked out the *front* way to the inn, under no dread of the unruly mob, though begged not to do so by his friends, who had sent his carriage down to the inn."

Another correspondent considers it important to Mr. Courtenay to state that he did not introduce the forms objected to, but found them in full force when he was appointed to St. Sidwell's. Our correspondent also cites various expressions in our accounts of the Church controversy which he considers incorrect or partial, and as showing a desire to support the laity in opposition to the clergy. In reply, we beg to state that it is not the object of this Paper to express any opinions on the subject. We have given the accounts of the recent differences precisely as we have found them in the London morning papers, which are supposed to be in possession of the best intelligence; and every expression to which our correspondent objects was copied from their columns. We have no means of verifying any of the circumstances from our own personal knowledge; and in the difficult and irksome task of condensing the lengthy reports of the Church meetings, we have endeavoured to give the statements impartially on both sides, and in the very words in which we have found them. It may, therefore, be useful to repeat that, like all the weekly newspapers, we are indebted for the materials from which our news is compiled entirely to the daily papers, and that we are unable to do more than record events in the form in which they publish them.—A meeting of the parishioners of St. Sidwell's was held last week, by requisition from forty-one of the principal rate-payers, to inquire whether it was not expedient to put a stop to the late disturbances, by calling on the Rev. F. Courtenay to resign his cure. The Rev. Mr. Atherley attended the meeting, and, after some angry discussion, obtained leave to send for Mr. Courtenay, who had, he said, a communication to make to them. Mr. Courtenay was then introduced by Mr. Atherley to the meeting. He said: "Mr. Warden and gentlemen, you have met here to-day to take into consideration what steps should be taken to put an end to the disturbances which the parish has suffered for two Sundays. These have arisen from the continued use of the surplice in preaching. I am in a position to be able to tell you that I have authority to discontinue the use of the surplice (cheers and uproar—cries of 'it is too late'). I am not going to say more, nor the reasons why I do it; but I thought that at all events it was due to you, or to such of you as are friends of mine, while you are debating on measures which have arisen from it; and having said that, I have no more to say. What course has been taken by others and led to this, it is better you should see in black and white. There can be no reason why I should stay among you any longer; and I wish you all a very good morning." The rev. gentleman was leaving the room, when the chairman intimated to him that some parishioners wished to ask him a question; he replied, "I can't stay to answer questions," and was in the act of retiring, when several parishioners insisted that there were some points which called for explanation, particularly referring to the charge brought against him of having torn down one of the printed notices on the church gate and stamped it under foot. Mr. Courtenay declared that he would not be catechised, but said that the notice was in strips, and he tore it down on that account. Several parishioners denied this, and stated that it had only just been put up and was entire when Mr. Courtenay tore it from the gate. The rev. gentleman then said that "when he tore it it came into strips." A scene of great confusion followed this observation, in the midst of which Mr. Courtenay left the room with the rector; and the parishioners resolved that nothing short of Mr. Courtenay's retirement from the curacy would restore peace. On Friday the letter from the bishop which led to the surrender of the surplice was published, and excited great attention. It was inclosed to one of the parishioners, by Mr. Courtenay, who stated that the bishop had sent it to the Mayor of Exeter, in consequence of the Mayor's application to his Lordship to interfere. The letter was sent unopened to the Mayor, to be presented to Mr. Courtenay, if he thought proper to do so. The following is the bishop's letter:—"Bishopstowe, Jan. 22.—Dear Sir,—Not having received from you, nor from others, till this day, any authentic account of the unhappy scenes which, on two successive Sundays, have been enacted at St. Sidwell's, I have felt it my duty to forbear from writing to you on the subject. In the very imperfect state of information in which I was placed, I was afraid of incurring the responsibility of advising you to yield to the violence of the populace, lest such a concession should be deemed injurious to the cause of peace and order by those whose official duty it is to guard those main objects of all good government. Letters which I have this day received from the Mayor of Exeter seem to intimate

that it is the wish of himself, and of the magistrates who are acting with him, that I should take this step. Still, as I do not feel myself competent to decide what course is fittest, I inclose this letter, open to the Mayor, who will either deliver it to you, or not, as he in his discretion shall deem proper. If you receive this letter, you will understand from it that I advise you to give way at the request of the civil authorities of Exeter, and not to persist in wearing the surplice in the pulpit, unless, conscientiously, and on full inquiry, you have satisfied yourself that your engagements to the Church require you to wear the surplice when you preach. I do not myself think that the matter is so free from doubt that you may not act on your bishop's advice, as now given to you. Still I do not pretend to any right to *order* you to wear the gown—I only advise it, and advise it with this limitation, that you can, without wounding your own conscience, comply. I am, dear Sir, your faithful friend and bishop, H. Exeter. The Rev. F. Courtenay."—In accordance with the announcement that the surplice would be abandoned, the sermon on Sunday last was preached in the gown, and no disturbance took place, although the streets as before were crowded with hundreds of people. Mr. Courtenay was escorted to and from his residence by a strong body of police, but there was no attempt at rioting, and the crowd quietly dispersed.

Ipswich.—On Saturday, William Howell, who was convicted, with his brother, Walter Howell, and Israel Shipley, at the assizes at Bury St. Edmund's, on the 16th December last, of the murder of James M'Fadden, a constable attached to the East Suffolk Police, expiated his crime on the drop in front of the County Gaol, the other two convicts having received a respite during Her Majesty's pleasure. The grounds upon which the respite has been granted are kept a profound secret, the authorities, it is said, deeming it probable that a promulgation of the facts, at the present period, would tend to defeat the ends of public justice. No less than 10,000 people assembled to witness the execution.

Leicester.—On the 17th ult., two young farmers, Thomas and Henry Cumberland, living near Newtown, Linford, were charged before the magistrates of this town with night poaching in the preserves of the Earl of Stamford. The offence was clearly proved, and the prisoners were sentenced respectively to two and three months' imprisonment, with hard labour.

Liverpool.—The storm, which was felt generally throughout England on Saturday and Sunday, was very severe in the Mersey, and numerous casualties are reported. The Athlone steamer, on her voyage to Belfast, was in great danger, and was obliged to put back. Among her passengers were the celebrated pianist, M. Thalberg, and the well-known vocalists, Miss Birch, Miss Dolby, Mr. John Parry, and Mr. Calkin. Mrs. Dolby, and Mr. Calcott, the manager of this musical company, were also on board. The whole party were in such imminent peril, that they had given up all hopes of safety, and appear to have had a narrow escape.—A correspondent informs us that the story which appeared in our Paper of Saturday last, copied from the daily papers under the head of Liverpool, respecting the *lady* in whiskers, was published in the newspapers a year or two back, exactly as it is now given, even to the dropping of the whip, and the carving knife and pair of pistols left behind; the only change is in the locality and the names.

Manchester.—The Anti-Corn Law League held their annual aggregate meeting in this town last week. The report of the treasurer stated that at the commencement of the year 1843-4, there was a balance of cash in hand of 2476*l.*, and the amount of subscriptions received up to the 31st December last, on account of the Great League Fund, was 82,735*l.*; interest, 779*l.*; total, 86,009*l.* The expenditure was about 59,000*l.*; leaving a balance in the hands of the treasurer of 26,675*l.*—On Tuesday morning, as one of the engines on the Manchester and Leeds Railway at Hunt's Bank was preparing to take the early train to Leeds, the boiler burst, killed three persons on the spot, and seriously injured three others.

Norwich.—The Rev. Canon Wodehouse recently addressed a letter to the Bishop of Norwich, stating that from conscientious objections to certain parts of the Church ritual in their literal signification, he felt it necessary to tender his resignation of his benefice and canonry. Mr. Wodehouse specified the following as the grounds of his objections:—"The damnatory clauses of the Athanasian Creed, the form of absolution in the office for the visitation of the sick, and the following part of the form of ordaining priests:—*Receive the Holy Ghost*, for the office and work of a priest of the Church of God now committed unto thee by the imposition of our hands. *Whose sins thou dost forgive, they are forgiven; and whose sins thou dost retain, they are retained,*" &c. The Bishop returned the following reply, which has just been published, with Mr. Wodehouse's letter of resignation:—

"Palace, Norwich, Nov. 15, 1841.—My dear Mr. Wodehouse—I much regret that you should have thought it necessary to offer a resignation of your preferment, for the reasons assigned in the paper you have placed in my hands, with a view to my giving an official opinion on a question of such importance, and involving so many serious considerations. If I had seen any cause since I have been Bishop of this diocese to conclude that you were maintaining or publishing opinions discreditable to you as a clergyman, or contrary to the doctrines and discipline of the Church, it would have been my duty to call upon you to retract such opinions, or to proceed against you according to ecclesiastical law, without waiting for the time when you might judge it proper to tender the resignation of your preferment. As, however, you have now done so, I have no hesitation in giving you a decisive answer, that I shall neither accept nor encourage your resignation. 1st, Because, I believe that the objections you entertain to certain parts of our ritual, in their literal acceptation, are not inconsistent with a sincere and hearty attachment to the general doctrines of the Church, and to the form of prayer prescribed by it. 2d, Because, considering the number and nature of many of the propositions included in our Thirty-nine Articles, the Homilies, and Book of Common Prayer, to which assent is given by subscription, it is impossible that any number of individuals should view such propositions in exactly the same light, and subscribe to them in precisely the same sense. Latitude in subscription is therefore absolutely unavoidable. 3d, Because such latitude has been repeatedly recognised and defended by the highest authorities in our Church from the time of the Reformation to the present moment, when it is claimed and exercised in its fullest extent by many who hold and proclaim opinions much further removed from the spirit of our Protestant Church than are any objections of yours; as well as by many who have taken the same view as yourself of the points to which your scruples refer. There would, therefore, be a manifest injustice in allowing you to resign a situation which you have filled long and usefully, while others, who on the same grounds would be equally called to resign theirs, continue to retain them. The interpretation you entertain of the points in question has been so far acknowledged and established by general consent, that a latitude to that extent may be fairly and properly exercised by any who are called upon to subscribe to the Thirty-nine Articles and Book of Common Prayer, although there may be others who are anxious to carry out to their full extent those remnants of Roman Catholic worship and priestly power, which, under the peculiar circumstances of the times when our Church was gradually severing itself from that of Rome, were still retained in our reformed ritual. Whilst in the exercise of that discretion intrusted to every Bishop, which in the present state of the Church cannot be shared with any other adviser or authority, I come to the above conclusions, I at the same time feel strongly with you how far more satisfactory it would be if steps could be taken to remove difficulties and remedy evils of which many—and I have reason to believe an increasing number—of our clergy justly complain; for it is impossible to shut our eyes to the obvious truth, that 'a clearer explanation is required of some words and phrases that are rather of doubtful signification, or otherwise liable to misconstruction,' in days like the present, when our Church is so fearfully divided against itself, and suffering from dissensions and internal schisms far more dangerous and perplexing than those with which she is assailed by adversaries without her pale. In forwarding this expression of my judgment on your case, I cannot conclude without further expressing my regret that, in the last of those publications you have from time to time put forth for the sake of a sound and legitimate object, you adopted a title calculated, I think, needlessly to offend and irritate without benefiting your cause.—I remain, yours faithfully, E. Norwich."

Oxford.—The controversy on the Tractarian doctrines which are to be brought before the University on the 13th inst., grows hotter as the meeting of Convocation approaches. Numerous pamphlets are appearing on the subject, and a requisition is now in course of signature, the object of which is to obtain from the Convocation a formal condemnation of the principles put forth in the famous Tract No. 90. The requisition is couched in the following terms:—"To the Reverend the Vice-Chancellor and the Members of the Hebdomadal Board. We, the undersigned members of Convocation, respectfully but earnestly request that you will take immediate measures for submitting to the Convocation about to assemble on the 13th of February next, a resolution conveying the formal censure of the University upon the principles inculcated in the 90th Number of the 'Tracts for the Times,' and a solemn repudiation of the modes of interpreting the Thirty-nine Articles therein suggested. We consider such a censure on the part of the University imperatively called for, and peculiarly appropriate to the important occasion already referred to; inasmuch as we cannot but recognise in Mr. Ward's 'Ideal of a Christian Church,' a legitimate development of the principles of Tract 90, and a practical exhibition of the pernicious effects which must necessarily result from their adoption."—At a meeting of the Heads of Houses and Proctors, held last week in consequence of the misconceptions prevailing as to the proposed statute relative to *subscription*, it was unanimously resolved to withdraw the measure for the present. Some conversation took place relating to the opinion of the Queen's Advocate and Mr. Bethell, Q.C., on the illegality of the proposition for Mr. Ward's degradation from his degrees; but it was understood that legal opinions on the subject, in favour of the course taken by the board, had been received previous to the new statute being published in Michaelmas Term. The resolutions and the degradation statute will therefore be submitted to the Convocation on the 13th, without the additional one concerning subscription.—Last week the whole of the horses, amounting to 30, of the Defiance Oxford coach, which for many years past has gone the road between Oxford and London through Henley, were sold by auction at Dixon's Repository. The railway being now opened throughout the line the last of the coaches has been taken off the road.

Plymouth.—The Lords of the Admiralty have ordered another experimental trip between the Espiègle gun-brig, constructed by the Naval School, and the Flying Fish, constructed by the Surveyor of the Navy. The Commanders have also been ordered to change vessels.

Portsmouth.—The gun-room officers of the Albion recently applied to Commander Chambers, of that ship, to know where they were to stow their live and dead stock, fowls, ducks, sheep, lambs, and milch cow; and not being satisfied with the answer that officer gave them, they addressed themselves, by letter, on the subject to Captain Lockyer, who being of the old school, and unaccustomed, as a youngster, to such luxuries, was equally at a loss to know how the new school was to be accommodated in the matter, and to solve the problem, he inclosed what would formerly have been called the cockpit letter to the Admiralty. Their Lordships answered quickly and determinedly by dispersing the whole of the Albion's gun-room mess into the brigs now about to proceed to various quarters of the world.—Another of the very few remaining mementos of the gallantry of our Navy is about to pass away, the Donegal, formerly the Hoche, so gallantly captured off the coast of Ireland, by the late Admiral Thornborough, on the occasion of the French invasion of that country in the Irish rebellion, being ordered to be sold, preparatory to breaking up.

Sheffield.—The *Sheffield Iris* states that much surprise has been manifested in the vicinity of Leam-hall, the seat of M. M. Middleton, Esq., by the discovery on the banks of the Derwent, of a dead crocodile, 33 inches in length. The reptile was taken up, apparently just after death, and astonished, or rather terrified, a great many who are in the habit of wading the river. After examination by numerous persons, it is pronounced to be a young crocodile, corresponding in every particular with those of the Nile. How it has come to this part of the Derwent is a question. Some believe it to have been deposited there from a caravan of wild beasts; others, that it has travelled from the ocean, while others believe it not unlikely that it is a hoax.

Stafford.—The two prisoners, Downing and Powis, convicted at the last assizes of murder, were executed in this town on Saturday. Their execution had been respited for the purpose of submitting a case for the decision of the Judges, but the point in question was decided against them. The prisoners died with strong protestations of their innocence.

Railways.

The announcement of the Board of Trade which appeared in the *Gazette* of Friday, was noticed briefly in our last. The Board states that having had under consideration two schemes for completing the Eastern Line of Railway communication to Scotland, they have determined on reporting to Parliament in *favour* of the Newcastle and Berwick Railway, with Branch to Kelso; and *against* the Northumberland Railway, with Branch from Berwick to Kelso. And the Board having had under consideration 12 schemes for extending railway communication in the districts of Norfolk and Suffolk, have decided on reporting to Parliament in *favour* of the Bury and Ipswich; Ipswich and Norwich Extension; Lynn and Ely; *against* the Diss and Colchester; Eastern Counties; Colchester and Bury Extension; London and Norwich direct; Norwich and Brandon—Diss Branch; Wells and Thetford; and recommending the *postponement* until a future period, of the Direct East Dereham and Norwich; Norwich and Brandon—Dereham Branch; Lynn and East Dereham; Diss, Beccles, and Yarmouth; Diss and Colchester—Redham and Lodden Branches: and the Board having had under consideration eight schemes for extending railway communication to the north and north-west of Ireland, have determined on reporting to Parliament in *favour* of Belfast and Ballymena; Dublin and Belfast Junction, with Branch to Drogheda and Kells; Dublin and Drogheda—Howth Branch; Ulster Extension—Portadown to Armagh; and of the Dundalk and Enniskillen (with the exception of the Monaghan Branch); Newry and Enniskillen (with the exception of the portion of the line between Newry and Armagh); subject to equitable arrangements for the construction and joint use of the line between Enniskillen and Clones, common to the two schemes; and also for improving the railway communication by the Belfast Junction line to Newry, and for securing due facilities to the Newry traffic. And *against* the Great North Western, Northern Railway, inland line (Armagh to Dublin).—At a meeting of landowners held at Farningham last week, it was agreed to petition Parliament against the Central Kent line, which has received the sanction of the Board of Trade. It was also resolved at a meeting of the inhabitants of Greenwich on Friday, to oppose the North Kent line, which it is proposed to carry under London-street, across Royal-hill with a cutting of 9 feet, and Croom's-hill with a cutting of 20 feet. After passing through several streets and new houses, it abruptly stops at the edge of the Park, the requisite sanction to proceed through it not having been obtained, and beginning again at Maize-hill on the other side of the Park. The line generally has received the sanction of the Board of Trade, with however a special reservation of the junction between Greenwich and Woolwich.—On Thursday at a meeting at Honiton, the inhabitants resolved to petition Parliament in favour of the line from Salisbury to Yeovil and Exeter, against which the Board of Trade have reported. Active measures are taking in other parts of Wilts, Dorset, and Devon, in favour of this line.—The negotiations between the projectors of the Monmouthshire Railway and the proprietors of the Monmouthshire Canal have been brought to a satisfactory conclusion. The basis of the arrangement is, that the Canal Company undertake to make a new line of railway to Pontypool, and improve the present inadequate communication throughout that important portion of the county; and the projectors of the railway from Newport to Nantyglo withdraw their Bill.—The provisional Committee of the Manchester and Buxton Railway has just issued a Report, in which it is stated that the project embraces a line from the Manchester and Birmingham, at Poynton, to Buxton, with two short branches—the one designed to form a junction with the Cromford and High Peak Railway, and the other giving access to the valuable lime quarries of the Duke of Devonshire and other landowners. They announce that they have concluded an arrangement with Lord Vernon, whereby their line at Poynton is to traverse his lordship's collieries; thus insuring a considerable accession to the traffic, with diminished cost in the works. They have also obtained the countenance and sanction of the Duke of Devonshire, of Thos. Legh, Esq., of Lyme, of J. W. Jodrell, Esq., of Yeardsley, and other landowners, whose estates the line will traverse for a distance of about 13¾ miles, the entire length of the railway being 18¼ miles.

—The Bristol and Exeter Company have held a special meeting, at which they resolved to apply to Parliament for powers to make branches from Durston, between Bridgewater and Taunton, to Yeovil; from the Clevedon-road station to Clevedon; and for making an improved junction with the Great Western Company at the Bristol terminus. They also determined upon taking 1500 shares in the Cornwall Railway. For these purposes the shareholders authorised the directors to raise an additional capital of 500,000*l.* by the issue of 15,000 third shares at 33*l.* 6*s.* 8*d.* per share, to be distributed in the proportion of one new third to each old share, on notifying the acceptance, and paying the deposit of 2*l.* before the 31st inst; 4 per cent. interest to be allowed on all calls.—The Lancaster and Carlisle Company have completed the additional agreement with the Lancaster and Preston Company for the transfer of the latter railway, in consideration of a guarantee of per cent. on the capital of 400,000*l.*, with an option of amalgamation, or one third share of profits above per cent. All encumbrances, including the lease to the Lancaster Canal and the debt of 113,000*l.*, go with the property. The Lancaster and Carlisle line is progressing favourably, and the contracts have been made on very advantageous terms.—A meeting of the inhabitants of Oxford has been held, for the purpose of considering the proposed new lines of railway to and from that city. Mr. Stephenson, on behalf of the London and Birmingham Company, explained to the meeting the advantages that Oxford would derive from carrying out the intended London and Worcester and Rugby and Oxford Railway, particularly from the transit it would give for conveyance of coals from the coal-fields of the Midland Counties to Oxford and neighbourhood, which he assured the meeting would be the means of getting coals to that city for something like 15*s.* or 16*s.* per ton, instead of 25*s.* and 26*s.* per ton, which was the present price. The line, he stated, would be direct to Rugby, through the important town of Banbury; that a branch would go to Worcester, through or near Stratford-on-Avon, and along the Vale of Evesham, and also that another branch would join the London and Birmingham near Tring, including in its course the towns of Bicester and Aylesbury. The difference between this line of road to London, and the Great Western, would be something like eight miles, but he apprehended there would be no saving of time in going by the latter line, as the advantageous situation of Euston-square, as compared with the Paddington station, would fully compensate for the difference of 8 miles, the station being only 2 miles from the City, the other 4. Resolutions in favour of the proposed line were carried almost unanimously, together with a memorial to the Board of Trade in its favour. The town Council of Worcester, however, have resolved, by a majority of 18 to 7, to oppose the measure.—A special meeting of the Chester and Birkenhead Company was held last week, for the purpose of sanctioning an application to Parliament by the directors for an extension of the line from Grange-lane to the Wallasey-pool docks by a tunnel under the town of Birkenhead. Another special meeting will have to be held to confirm the project; the present being restricted to give the Directors power to apply to the Legislature on the subject.—At a meeting held at Birmingham on Wednesday, a resolution for the amalgamation of the Birmingham and Glocester with the Glocester and Bristol Railway, was unanimously adopted.—The Glasgow Town Council have resolved to petition Parliament and the Board of Trade against the proposed Junction between the Edinburgh and Glasgow, and the Glasgow and Ayr lines, by means of arches thrown across the streets of the city, and passed resolutions in favour of the proposed Caledonian Railway, as being the shortest route between Glasgow and the south, and as calculated, compared with the Dumfries line, to reduce the distance materially between Edinburgh and Carlisle, Liverpool, Manchester, and London.

Ireland.

Dublin.—The agitation on the Charitable Bequests Act has received a fresh impulse from a letter addressed by the Rev. Dr. M'Hale, Roman Catholic Archbishop of Tuam, to Sir R. Peel. This document is a vehement attack on the Premier for his recent measures in regard to Ireland, and a no less angry denunciation of the Church of England, which it proclaims as powerless to improve the moral condition of the people.

"The lamentable state of social disorganisation," says Archbishop M'Hale, "to which I have alluded is felt and deplored by many of the English prelates, who confess they are unable to apply a remedy; witness, for example, the ludicrous embarrassment of his Lordship of Exeter—to-day issuing his episcopal mandates for ecclesiastical uniformity, and revoking them again, it is said, at the imperious requisition of the Minister of the Crown. Such of the members of that body as possess a tolerable share of learning, whose intellect ranges beyond the small pale of the Anglican Establishment, and the brief period of its disastrous schism, surveying the social happiness enjoyed by the nations when the Church was not the chained handmaid of the Crown, are in a condition the most pitiable. While their zeal is animated by the heroic fortitude of the ancient champions of the freedom of the Church, they fancy for a time that they can imitate their example. No sooner, however, do they engage in the attempt than they are obliged to own that from the Establishment, though retaining some of the material features of a church, the spirit that animated and informed it is gone; and instead of the holy vigour of an Ambrose or an Anselm, who arraigned the cruel delinquencies of Royalty itself, they are silent on the crimes of the nation, because they must regulate by the nod of a political Minister the nature of their pastoral instructions."

He then asks whether Sir R. Peel wishes to bring about a similar reform in the Catholic Church of Ireland, and proceeds to discuss the Charitable Bequests Act at some length:—
